WHEN TO START.—In the larger Western orchards alarm thermometers are used. These are regulated and attached so as to ring an alarm in the house whenever the mercury in the thermometer goes down to a certain point. Usually this is put at 33°, and when thus adjusted the house bell will ring when the thermometer register 33°. Some growers arrange for the alarm at 35°, or even higher, while others wait until the mercury strikes 32°. Good judgment is necessary in this point, so as to avoid wasting the fuel. Generally speaking, if the thermometer goes down slowly through the night, but reaches 32° a short time before sunrise, the experienced grower will not start his fires. If, however, the thermometer reaches 32° early in the night some of the pots will be started. This is a matter to be determined largely by experience and good judgment. There is more danger on a clear night than when the weather is cloudy. The U. S. Weather Service is prepared to report weather condtiions and forecasts, and many of the larger growers keep in close touch with the department, and are guided in lighting the fires by the weather reports or indications which they receive. There are various plans for starting the fires. In some orchards the oil burners may be connected with electric lighters. This service may go so far that at the time the warning bell rings in the house the fires are also automatically started in the heaters. Most growers, however, start their fires by using a torch, and pouring a small quantity of gasoline on top of the oil. In some cases men ride through the orchard on horseback, starting the fires or regulating the covers so as to increase or decrease the heat and smudge.

COST OF OUTFIT.—The cost of such an equipment will vary. The heaters cost from $20 to $75 per acre, with less than this for home-made fixtures, such as old cans or paint kegs. It will require at least 300 gallons of oil per acre to make sure of the average season. This will cost all the way from $10 to $20, depending upon the local price of the oil. In addition to this will be the cost of the tanks for distribution and storage, the time required in handling the outfit, and the other apparatus. Mr. John Bland of Missouri gives the following figures as the cost of equipment for a 30-acre orchard. In one year he says that 400 gallons per acre would have been required to carry the

GRIMM ALFALFA; COMMON ALFALFA. FIG. 249.

orchard through all the freezes. In most other seasons 250 gallons of oil would have answered. His estimate follows:

COST OF THIRTY-ACRE EQUIPMENT.

15,000 gallons of oil, at 3½c	$525.00
Storage tank of 15,000 gallons capacity	171.00
2,400 smudge pots, at 13c	312.00
300-gallon wagon tank	22.00
Cost of 30 acres	$1,030.00
Cost of one acre	34.33

This means $34 an acre, and it will seem prohibitive to many a grower, yet it is an effective form of insurance for the crop, and many a New York State grower could well have paid twice that sum in years past to protect his orchard in time of a late frost. We find that some of our readers appear to think that this method of fighting frost is designed for Winter protection. Nothing of the sort. It is merely intended as a possible means for raising the temperature artificially for a day or two at a time during the Spring, when an untimely frost strikes the orchard just at the time of blooming. The same system is employed by gardeners or strawberry growers, in protecting their fruit or vegetables. It does not work as well usually with these low-growing crops, which are close to the ground, and our judgment is that in most of the fruit orchards of the East the system will not give as good satisfaction as in the more level and protected Western orchards. We have, most of us, followed the plan of planting our trees on the hilltops, or upon rolling ground, and these are the hardest places of all to heat, since they receive a sweep of the wind which will carry the heat of the fires away.

MALE AND FEMALE ENGLISH SPARROW. FIG. 250.

NO FRIEND OF A GERMAN HARE.

J. V. inquires about German hares, and says he wants to secure some to liberate where he lives. They are plentiful in this section, and in the Summer many of the half-grown ones are caught and shipped to various parts of the country. I do not for a moment suppose that J. V. knows anything about a German hare. If he does, and he ever secures stock for liberating in his community, I advise the citizens of that place to shoot them at once, and I was going to say shoot J. V. at the same time, but if a person knowingly introduces this pest into a country shooting is altogether too gentle treatment for him; he should at the very least be hanged, drawn and quartered. A wealthy men in this county got them for his preserve a few years ago, but some of them soon got out, and in a short time the whole county was overrun with them. They will ruin any kind of a fruit tree that is less than 15 years old, though they decidedly prefer the apple. Every tree now that we set requires a heavy wire protector that costs almost as much as the tree itself. We have tried the cheaper protectors, but in the end they are the most expensive of all. A single hare will ruin as high as 100 trees in one night. Personally I have had nearly 700 ruined by them. In this township we have amended the game law to suit ourselves, and we hunt them from year's end to year's end, and if all townships kill as many as we do there must be an annual slaughter of forty or fifty thousand in the county. As a result of the hares every mother's son keeps a hound dog, while the shiftless, irresponsible fellows keep two or three, and as a result of the hounds a flock of sheep stands about the same chance as the proverbial clawless cat.

Dutchess Co., N. Y. HARVEY LOSEE.

A LIME-CRUSHING CLUB.

Dr. I. W. Carey of Highland County is planning to organize a club of farmers who will own the crusher and engine for crushing limestone for agricultural purposes, the machine to be moved about so as to avoid long hauls as much as possible. At present Dr. Carey owns the outfit, and has operated it for several seasons, going to different neighborhoods for, say, a 50-ton job, and moving elsewhere when all orders were filled. He charged $2 per ton for crushing, but says that $2.25 would be necessary to return a profit. He finds a greater profit in crushing stone for road-making, but thinks that it would be a good thing for a company of farmers to own and operate a crusher for their own needs. A crusher has been operated in the western part of the county, but this was recently sold and moved to the northern part of the county, and too far away to be of value to anyone in this vicinity. Good rock of magnesium and calcium composition is to be found almost anywhere here, and location of a crusher is governed by considerations of the easy distribution of the finished product. Of course a crushing club should be large enough to justify the purchase of a fair-sized outfit, and to keep it busy. W. E. D.

Hillsboro, Ohio.

PRUNING CHERRIES WHILE IN FRUIT.

I have a number of sour cherry trees which have grown too high and should be headed lower. How will it do to wait until cherries are ripe and then cut the upright branches off? It will be a cheap way of picking the fruit. Will it work well in re-shaping the trees? B.

Ohio.

We understand that Chas. S. Scoon, a well-known cherry grower at Geneva, N. Y., has tried this very plan. He advises against it. He says it merely hurts the tree without accomplishing any permanent shortage of height. As the result of such cutting he had five or six tall branches in the place of one. They were soon as high as before. His trees were too close together, so instead of trying to cut the tops off, he took out half the trees and gave them a chance to spread out. While Mr. Scoon does not advocate such topping, it is at times necessary to curtail the height. To do this it is better to cut out one or more entire central limbs down to where they branch from other wood. This cuts off height without stimulating too much wood growth up in the air. This is a fair statement of the matter. As an easy way to pick cherries, the plan might answer, but in its permanent effect upon the tree it will not pay.

FARMERS' CLUB

Corn in Young Orchards.

Will corn hurt a young apple orchard? The land is new and sprouts up badly; good land. I. J. F.

Stuarts Draft, Va.

A variety of corn with a small short stalk would not hurt a young orchard, provided it is not planted close to the trees. We plant corn in our own orchard for four or five years at least, seeding down at the last cultivation to rye and vetch, plowing this crop under in the Spring and planting the corn again. One of the small low-growing and slender varieties will be better for this use than the larger kinds. Do not put the corn too close to the trees. We should leave at least four feet between the rows of trees and the first row of corn. If the land is good the corn crop ought to pay practically all the expenses of the spraying. That is what it does for us. Our own soil is not strong, and so we use lime and some fertilizer in addition to cover crops.

Tarnished Plant-bug on Dahlias.

What can I do to prevent an insect or bug from working in the buds of of my Dahlias just before the flower opens, destroying or injuring the bud so it does not open or bloom? I have noticed for three or four years our Dahlias would have plenty of buds, but would not open or flower. I found an insect working in the bud which seemed very shy, and upon being disturbed flew away. Last year from 50 plants, had only five flowers.

Amsterdam, N. Y. H. W.

The marauder is, no doubt, the Tarnished plant-bug, which is extremely destructive to Dahlias in some localities. Its control is difficult, as the adults, which are brown and dull yellow, about one-fifth of an inch long, are too active to be affected by insecticides. The young nymphs may be killed with seven per cent. kerosene emulsion or tobacco extract. The only other means of control is to clear up and burn all rubbish in the Fall, as the bugs hibernate in crop remnants. The insect pierces the young bud shoots and sucks the sap. The shoots are blackened and distorted, and the injury causes new side shoots to form, which often suffer the same way. Where flower buds develop, they are blasted or one-sided. Clean up all rubbish left around the garden, and burn it; you will destroy many other enemies besides this plant-bug.

Agricultural Student and Agent.

The Ohio Agricultural College tells of a student who studied the theory of fertilizers and plant food, went back to his home and talked to the farmers about the fertilizer business. According to the story, a fertilizer agent came along telling some of the surprising yarns about his goods. For example, this man claimed that the "filler" in a fertilizer was necessary in order to ripen the plant food, whatever that may mean, and that it prevented concentration, so that the plant would not get too much food at one time. It seems that this college student got into a debate with the agent, knew more about the subject than he did, and argued him down to the benefit and pride of his neighbors. This is a good story, and such a young man who could talk sensibly and fairly on the subject would prove a help to any farm community. Some of the fertilizer agents do like to tell big stories about their goods whenever they think they can get away with it, and find no one there who could expose their bogus science. There are other fertilizer agents, however, who know very much better than to do this, and they would not make any such foolish statement before a company of intelligent farmers. Such a man as is here spoken of might well be called down and shown up when he begins to talk his absurd lingo. On the other hand, there are intelligent fertilizer agents who are not only farmers themselves, but have made a careful study of the science of farming. These men can be, and usually are, of much value in a farming community. We do not believe in the theory that all agents are rogues and rascals, because they are trying to sell ready-mixed goods or manufactured articles. The tendency of the times and the tendeney of the farm education is to teach men to buy their goods to better advantage than ever before, yet there is no reason why the honest representative of a manufacturer should be branded as a rogue just because he tries to handle manufactured goods in a fair and honorable way. When an agent undertakes to bluff a farmer and tells him fairy tales about the wonderful and superior quality of his own goods, he ought to be called down, but they are not all of that class, and the reasonable people should have a fair and reasonable deal.

"Trenching" of Corn.

Since coming to this farm two years ago from New York State I have had poor success with corn due to "frenching." I am located on Chesapeake Bay and Worton Creek, in Kent County. The soil is clay loam, some sand mixed in, and is medium stiff, deficient in humus; heavy clay subsoil. This soil will run together and crust; if plowed wet lumps and is hard to fit. The history of the farm is that corn will "french" if plowed wet and planted early, although some excellent corn crops have been grown, but I cannot state under what conditions. Both years, 1912-13, ground was plowed too wet for this section, and planted about May 10. In 1912 on part of crop 2-8-10, on remainder 3½-8-4 fertilizer was used, 200 pounds to acre in the hill dropped with planter. In 1913 bone black, ground bone and kainit equal parts were used, 200 pounds under same conditions. Both years corn frenched, badly but later in 1913. This year I shall plow and plant late; if possible about May 20-25. Could you suggest a treatment or fertilizer that would be more advantageous? We have a large amount of oyster shell ground, but corn was not on that land. H. F. R.

Worton, Md.

The so-called frenching of corn is rather a mysterious trouble, and as a rule seems to be caused more by deficient drainage and soil acidity than by any fungus disease. I am perfectly familiar with the land in your section, and know that on many farms there are sinks that at times will hold water, and are always cold and wet in Spring, and hence are apt to be plowed too wet, when the surrounding land is in good plowing condition. Thorough drainage, liming occasionally, and the building up of the soil in vegetable decay, will be found to be the best preventives of the trouble. Plowing clay loam soil when wet is about one of the worst things a farmer can do for his land, for the soil will be cloggy all Summer, and will suffer more from dry weather by reason of the open condition of the soil, and the hard clods had as well be rocks so far as plant food in them is concerned. Much of that land would be greatly helped by tile drainage. Then too you seem to be making corn by depending on complete fertilizer mixtures. Growing corn by depending on these makes expensive corn. You should have a good three-year rotation that will bring a Winter cover of Crimson clover on the land to go in corn, and thus save the purchase of anything in the way of fertilizer but a carrier of phosphorus, for I do not believe that your land would need applications of potash if the soil was well stored with vegetable decay and limed about once in six years after plowing for corn. Right over in the next county of Queen Annes, the late S. T. Earle brought up his farm to an average of 40 bushels of wheat an acre and bought no fertilizer but plain acid phosphate, and that for the wheat. And in Talbot County W. O. Collier makes about 100 bushels of corn an acre on a Crimson clover sod without commercial fertilizer, and on land that formerly made 25 bushels. With good drainage and a good rotation of crops the lands in the Worton section of Kent County can be brought up to as high a production as any other part of the county. If you had clover to turn under, on which the farm manure had been spread during the Winter, you would need only an application of acid phosphate to make a good corn crop. W. F. MASSEY.

GRANNIE: "And wat's the matter wi' me richt leg, doctor?" Doctor: "Oh, just old age, Mrs. MacDougall." Grannie: "Hoots, man; ye're haverin'. The left leg's hale and sound, and they're baith the same age."—Punch.

WOOD'S
Famous Southern Ensilage Corn

Virginia has long been noted for growing and supplying the best of ensilage corns, and our Eureka and other varieties are quite generally grown all over this country. Virginia-grown corns, on account of climatic reasons, make much larger growth in the North and West than corn grown in any other section. Our corns, too, are cured under natural conditions, and are unsurpassed in vigorous germination.

We are headquarters and the largest ensilage corn dealers in this country.

PRICES:	Per bu. in 10 to 50-bushel lots.	Five-bushel lots.	One-bushel lots.

The Home Acre.

ESTABLISHING A LAWN.

I wish to put the ground about my new house in better condition, there being some of the excavating dirt about it. I can get some top soil or sand from the next lot, and have some good manure. Are there any fertilizing chemicals that will help? A good lawn, flowers, and possibly some garden truck is what I desire. P. J. H.

Long Island.

On the best natural grass lands it is almost invariably found upon making a comparison that the subsoil is distinctly of a heavier texture than the top soil, and very rarely if ever of a distinct sandy nature; hence it follows that for best results in the building up of land for lawn purposes, sand as a foundation is to be avoided, as much as possible. While it is true that fairly good lawns can be made and maintained on a distinctively sandy loam soil, underlaid with sand subsoil, it is equally true that the maintenance is more expensive and difficult than when the subsoil is of clay, as the grass will suffer much more quickly and severely during a drought, and if means of watering are not available, much of it will burn out entirely, particularly where the top soil is thin or where the capillary action of the water from some cause interfered with.

In the building up of the soil for lawn purposes, whatever the nature or texture of the soil used for a foundation, it should be spread evenly; that is it should be of equal and uniform depth all over the portion filled in, all unevenness should be avoided, so that when the top soil is put on, it also will be equal and uniform depth all over the made ground, otherwise the lawn will not be uniform in appearance but will be more or less spotted, due to the difference in the depth of the soils and kinds used in the filling in. All rubbish should be avoided and nothing in the way of scraps of lumber, brick, etc., should be mixed in the soil unless the fill is more than three feet deep; then such refuse may be used in the bottom, but never nearer than three feet to the surface. The top soil should be a good loam preferably from a cultivated field, as it is in much better mechanical condition and tilth than soils from vacant lots that have not been cultivated for a number of years. Soils from old worn-out lands are to be scrupulously avoided as totally unfit for lawn purposes. The top soil should be good and from eight to 12 inches deep. It should be made firm and be well fertilized with well-rotted, finely pulverized stable manure, applied at the rate of 20 to 30 tons to the acre, well worked into and thoroughly incorporated with the soil, either by plowing and harrowing or by spading and raking. If well manured at the time of making no other fertilizer will be required. The soil should in all respects receive the same care and fertilizing in the preparation as would be given if a prize crop of vegetables or grain was to be grown.

Before sowing the seed the land should be rolled with a hand roller. This will reveal all hollows and bumps; these should be leveled to the general surface with a steel rake, and if the surface showed much unevenness the first rolling, it should be rolled again, this time crossways of the first rolling, and all hollows filled up and bumps leveled as in the first rolling and raking. If the work has been properly done, the ground is now ready for the seed. If the soil is sandy and light, a mixture of grasses suitable for such soils should be sown. The same rule applies to heavy or intermediate soils. Nearly all the large seed houses can furnish grass seed suitable for any particular kind of soil, and when placing your order for the seed it is always well to state the nature and texture of the soil, so that your order may be filled with intelligence. In the sowing of seed do not be saving, but apply it in plenty, and sow it evenly, sow from 80 to 100 pounds to the acre. After the seed has been evenly sown, rake in very lightly and roll with the hand roller.

The proper maintenance and care of the lawn is of quite as much importance as that of the making. Therefore the cutting should be attended to as often as it is required; at the beginning the grass should not be cut closer to the ground than 1½ inches. After a few cuttings the grass will have become more firmly established when the mower may be lowered to cut it within an inch of the ground. In a wet season this height may be maintained throughout the season, but in a dry season it may be necessary to cut it somewhat higher and if a drought occurs, to suspend cutting until rains occur. Lawns cannot be kept in good condition from year to year without feeding, which necessarily must be supplied from the top, and should commence not later than the second year after establishing the lawn. The first food applied should be pure ground bone meal, at the rate of one-half ton to the acre early in Spring; a mid-summer application of bone may be made at the rate of one-fourth ton to the acre with increased benefit. The next food application should be well-rotted stable manure applied in early Winter, and just heavy enough to avoid smothering the grass. This is to be raked over in early Spring and all debris together with the rougher portion of the manure removed. These fertilizers should be applied alternately during the succeeding years as directed for the first and second years of feeding. In some soils, in fact most soils, it will greatly benefit the lawn to apply air-slaked lime at the rate of one ton to the acre about every fourth or fifth year, early in Spring. K.

Incubator as Hotbed.

I have an old incubator eight feet long, 28 inches wide, 400-egg capacity, lamps on both ends, that I would like to convert into some sort of arrangement to heat a bed for growing lettuce, etc., in a basement, with lots of windows on south side. I note quite a discussion in recent issues of utilizing lamps and oil heaters for cold frames. Can anyone advise me on my problem? J. B.

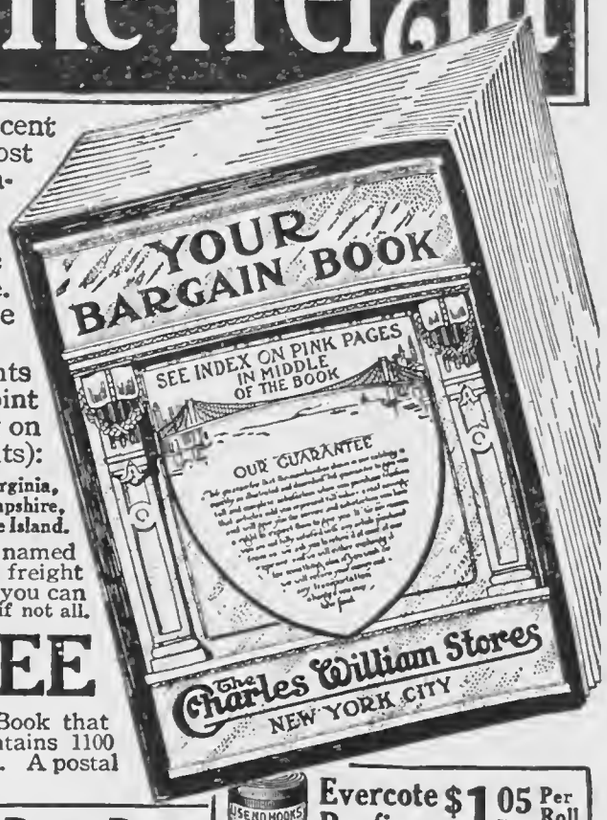
Oceanport, N. J.

I have seen hot water incubators converted into a propagating bed for the raising of vegetable and flowering plants that worked admirably, but have never seen the scheme tried out with a hot-air machine. I have no doubt it could be made to give good results, but the arrangement would probably have to be somewhat different from that provided for the hot water machine, particularly in the matter of drainage for the surplus water. With the hot water machine the surplus water was allowed to run inside the machine and out through the crevice at the door of the egg chamber. With a hot-air machine the matter of carrying off the drainage would have to be done from the outside. If I was handling this I would remove the top of the machine, and fit a sheet of zinc to the top, allowing the edges of the zinc to overlap the top of the incubator slightly on the sides, and at the ends. I would turn the edges of the zinc up a half-inch or so to act as a guard against water running on to the lamps. On this zinc I would fit a frame six or eight inches deep made from good seven-eighths inch material, to which I would fit a sash large enough to cover the top of the box or frame. I think with some such arrangement as this, and the use of about four inches of good soil in the bed, one would find it a very successful proposition. In the providing of this arrangement, the heat regulator would not be taken into account at all, as you would use a thermometer inside the plant frame and go according to it. The legs of the incubator would have to be elevated on one side a half-inch or so, so as to provide some fall for carrying off the surplus water. K.

A RELIGIOUS worker was visiting a Southern penitentiary, when one prisoner in some way took his fancy. This prisoner was a negro who evinced a religious fervor as deep as it was gratifying to the caller. "Of what are you accused?" the prisoner was asked. "Dey says I took a watch," answered the negro. "I made a good fight. I had a dandy lawyer, an' he done prove an alibi wif ten witnesses. Den my lawyer he shore made a strong speech to de jury. But it wasn't no use, suh; I gets ten years." "I don't see why you were not acquitted," said the religious worker. "Well, suh," explained the prisoner, "dere was shore one weak spot 'bout my defense—dey found de watch in my pocket."—Philadelphia Record.

Good News To Mail Order Buyers

We Pay the Freight



Now you can tell to a cent just what anything will cost laid down at your R. R. Station. You have nothing to pay when the goods arrive. No other Mail Order House gives you this great advantage. No other big Mail Order House Pays the Freight.

We pay the freight on all shipments of 100 pounds or more to any point in the following States (excepting on safes, vehicles and farm implements):

New York, Pennsylvania, Ohio, Virginia, West Virginia, Maryland, Delaware, New Jersey, Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island.

If you live anywhere outside the States named above we will pay a liberal part of the freight charges. So no matter where you live you can enjoy this Freight Paid Advantage in part if not all.

Hubbard's BONE BASE Fertilizers

to nourish and rejuvenate his tired, worn-out farms

Because BIGGER BETTER Crops

always gladden the heart of the true farmer. Read this letter, then let us help you make 1914 a record year.

Enfield, N. H., Sept 9, 1913.

The Rogers & Hubbard Co.,
Middletown, Conn.

Gentlemen—We have obtained very satisfactory results from the use of your Fertilizers this year. We used Hubbard's "Bone Base" Fertilizer for Oats and Top-Dressing at the rate of 350 pounds to the acre on new stock and cut over four tons of hay to the acre. We have a beautiful stand of Potatoes. Applied Hubbard's "Bone Base" Soluble Potato Manure, using 1500 pounds per acre. We think there is no Fertilizer like Hubbard's, after trying various brands that are on the market.

Respectfully yours,
CUMMINGS & SPONNER,
Per I. MALONE, *Supt.*

Write today for our booklets, **"Soil Fertility," "The Grass Crop," "The Apple,"** and **Hubbard's Bone Base 1914 Almanac,** which contains much valuable information about soil, fertilizers and other farm subjects. Sent free to any address.

GRAFTING QUESTIONS.

Would you give further advice on grafting as to time of cutting and inserting scions? I am interested in apple culture, and direct selling to consumers, and should like to try grafting Northern Spy on a few Oldenburg trees.
North Collins, N. Y. J. H. B.

Scions for grafting should be cut at once and stored in damp moss or sawdust and kept in a very cool place until wanted for setting as grafts. In a former article, page 172, I told how to cut and store the scions and also about making wax and the tools to use.

The ordinary method of grafting is what is known as the cleft or split style, and is very good for most fruit trees. There is almost no limit to the size of the trees that it may be used upon, for the work can be done on the smaller branches at any distance from the ground. The operator should begin at the top of any large tree and work downwards, so as to avoid danger of injuring the grafts set by working over or about them. Do not cut and attempt to make a success of grafts on very large stumps. Those about one to 2½ inches in diameter are about right. Select the most thrifty branches and such as have made the most vigorous growth the past season, and are likely to do so the coming one. The grafts will need all the vim the tree can give them. Cut the stumps about six inches from the crotch below them. Long, sprawly stumps are not good, for the grafts will soon replace the branch cut away and the less room for sprouts the better. Never cut squarely across in making the stub, but at an angle of about 45 degrees or more. Have the point of top of the slope on the upper side of the stub if it is not perpendicular, and on those that are perpendicular have it on the side next the prevailing Summer winds. This causes the growing grafts to bear their weight *against* the stump and not away from it, thus making the chances of blowing off while tender as small as is possible. The value of the sloping stump lies in the quicker and better healing over of the wound than if it was square on top. I never set but one scion on a stump and this always at the top of the slope. A very little of this point is cut off to make a place to receive the scion, but even this is not necessary. Cut the scion as it came from the tree into pieces about 3½ inches long or less. Trim each one to a wedge with long sloping cuts on opposite sides of the butt ends and be sure to have a bud near the top of the wedge. This wedge should be a little thicker on the edge on which the bud is, so that the pressure of the split stump will be greater there than on the other edge. Split the stump with a stout-bladed knife, and one that can be used as a pry to open the split. Insert the trimmed scion or graft by sliding the wedge with the thick edge outward or next the bark down the full length of the trimmed part. Be very careful to have the inside of the bark of both scion and stock to coincide or meet exactly. This is the place where the vital union takes place and the success of the whole operation depends on the skill and accurateness of the operator at this point.

Waxing properly is another most important matter. Many grafts fail because of imperfect waxing after all the rest of the work was well done. Be sure to cover every bit of the cut surfaces with the wax, and thick enough to withstand the warmth of the Summer sunshine. The wax may be applied with the hands or with a brush. In the latter case it must be kept slightly heated to be soft enough to be handled on a small brush. A pint or more in a granite iron cup kept over a lamp in a box or big can will serve very well to keep the wax hot.

Another good style for small stocks is the splice or tongue-graft. This is made by cutting a very long slope on the stock, and it must be as straight and smooth as it is possible to make it. About one-third the distance from the upper end, or point of this sloping cut, the knife should be forced downward deep enough to make a tongue half an inch or more in length. The scion is trimmed with a long slope, and a slit for the tongue of as nearly the same length as is possible. These two cut surfaces are then matched together, by forcing the tongues into the slits. This should make a very neat fit and a strong union. If the stock and scion are the same size the bark should match on both sides and at the ends as well, provided the work has been well done. If the stock is larger size the scion may be set so as to match the bark on one side only. The splice should be firmly tied or waxed grafting or budding cloth can be used instead, by bandaging all the splice very securely.

Bark-grafting can be done very successfully after the Spring flush of sap has become active enough to start the bark to peel. The stump should be cut as for cleft-grafting, and instead of splitting the stump only the bark should be slit at the top with a very sharp knife. The scion should be trimmed to a long slope all on one side, and the point forced down under the bark at the slit in the stock to the full length of the wedge. This should be bound fast with string and waxed or bandaged with waxed cloth. This kind of grafting can be done so late that the growth on the trees may be several inches long, but the scion must be kept perfectly dormant up to the time they are inserted.

H. E. VAN DEMAN.

Conifers from Seed.

I intend to plant some evergreen seeds, such as pine, spruce, cedar, arbor-vitæ, Silver fir and larch. Our soil is a light clay loam, and the only evergreen trees around here were planted. Will you advise me how to plant and care for them for the first three years? S. M.
Cincinnati, O.

For growing small quantities of conifers, the following method is given by Jackson Dawson of the Arnold Arboretum: Sow the seed soon after gathering in well-drained boxes, using well-pulverized sandy loam. Pile the boxes four or five deep in a sheltered place or pit, cover with boards, and when cold weather comes cover with leaves or hay. In the Spring (about the middle of April) move the boxes where they will get the morning sun. During the Summer keep the seedlings well weeded and watered. Shade with lath screens during the heat of the day in Summer. Winter the seedlings in the boxes, and transplant the next Spring, in rows. Put a mulch between the rows, which will conserve moisture and keep down weeds. Most conifers develop slowly at first, and are left in the seed-bed two or three years, root-pruned, and then set in nursery rows. Fir and larch seeds soon lose vitality, and have a lower viability than spruce and pine. Red cedar or juniper must have the pulp removed from the seed by maceration in hot water, following this by rubbing in sand. This seed may remain in the ground a year before germinating. The depth of planting varies with the size of the seed; larch needs just a sprinkle over it. If the seeds are sown in the open ground it may be done as soon as weather is settled in May, sowing in rows six inches apart, in well tilled soil, with mulch between rows, and shading as advised above.

EFFIE'S BROTHER: "Do you love my sister Effie?" Effie's Steady Company: "Why, Willie, that is a queer question. Why do you want to know?" Effie's Brother: "She said last night she would give a dollar to know, and I'd like to scoop it in."—Credit Lost.

NERVOUS OLD LADY (to chemist): "Are you sure you have mixed that medicine right?" Conscientious Chemist: "No, ma'm; I wouldn't go as far as to say that. But I've mixed it the way the doctor ordered it!"—Melbourne Australasian.

CORN IS KING

Give it the royal treatment it deserves

Use the Mapes Corn Manure

Preferably broadcast to encourage the wide-spreading root growth which is such a characteristic of the Corn crop.

The Mapes Corn Manure

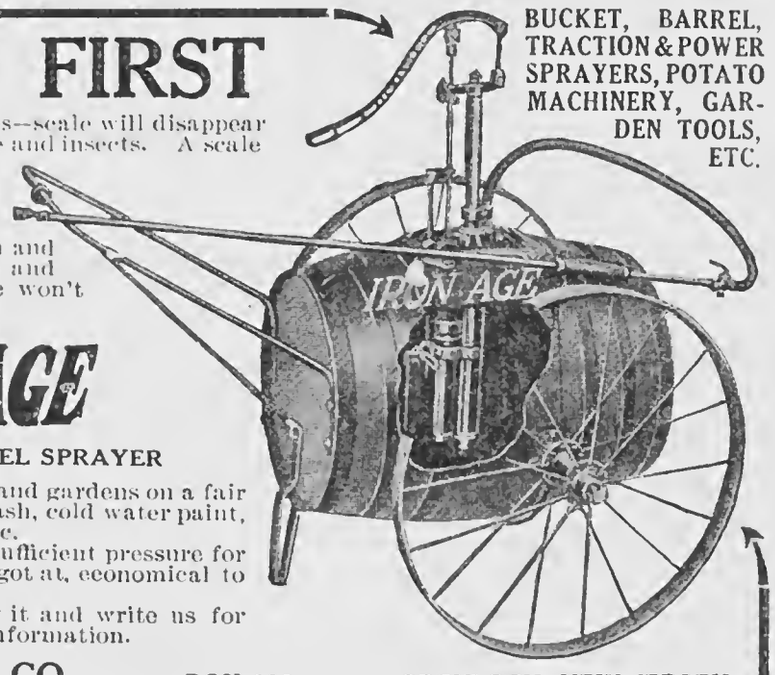
has become one of the most popular and successful of all our brands, rivaling even the celebrated Mapes Potato Manure.

Send for Our Pamphlet

The Mapes Formula and Peruvian Guano Company
143 Liberty Street, New York

SAFETY FIRST

Spray your trees and bushes—scale will disappear and you can control disease and insects. A scale infested tree is no good to you and very destructive to your neighbor. Cure it now and make better fruit, enough to pay. Whitewash and disinfect the poultry house and other buildings—then, lice won't bother you.



BUCKET, BARREL, TRACTION & POWER SPRAYERS, POTATO MACHINERY, GARDEN TOOLS, ETC.

IRON AGE

20 GALLON BARREL SPRAYER

Will care for trees, bushes and gardens on a fair sized place, apply whitewash, cold water paint, wash windows, wagons, etc.
One man can handle it, sufficient pressure for effective spraying, readily got at, economical to use, non-corrosive.
Ask your dealer to show it and write us for "Spray" book and spray information.

FROM OUR FARMS TO YOURS

WORKING INTO A MEADOW.

A three-acre field was planted to field corn, in 1911, size and quality of crop unknown to writer. This field was fallowed in 1912 and cultivated to keep down weeds. In 1913, it was planted to field corn with commercial fertilizers, except a half acre which received thin coating of horse manure. This lot is too wet, in Spring, to plow and plant at regular time and, having harvested the corn crop too late to seed down last Fall I have decided to seed this Spring to Timothy, Red clover and Red-top, with oats as a nurse crop, said oats to be fed, as hay, to milch cows. I have just read in THE R. N.-Y. your advice to one subscriber "not to seed land in the Spring." If I postpone seeding until September, what treatment would you recommend for the Summer? I have stable manure as follows: Cow and calf, seven months, two cows, three months, one horse eight months, and pig seven months, the latter having been kept under barn with above manure. This quantity is only sufficient for one acre, to do a thorough job. Should I seed the remainder with commercial fertilizers (and which formula) or spread the manure over entire field supplementing with commercial fertilizers? The income, after grass is ready to cut, will be larger, and expenses smaller than any other crop that I can put in. By getting oat hay this year, I save on my hay crop and have a better feed than dry fodder or ordinary hay. I presume I might put in Essex rape, as a cover crop to plow under this Fall, when preparing to seed, and mow off the weeds which will show above the rape. I treated my orchard to rape last Fall, as well as other open plots, for plowing under this Spring, but I now note, in the catalogue of a very large and prominent nursery company, that rape does not supply nitrogen to the soil. My seed catalogue recommends rape as a nitrogen cover crop and I sowed it with this idea in mind. C. B. H.

Connecticut.

In this case we should follow as closely as possible what is known as the "Clark" method of seeding to grass. Put the manure on the garden or cover crop and depend on fertilizers for the grass. Plow the land as early as possible and sow Canada peas and oats as we have so often advised—using say 300 pounds of fertilizer per acre. Cut this crop in late June (or when the little peas begin to form in the pods) and cure the same as clover hay. Then two courses are open to you. Under the "Clark" method the pea and oat stubble would be plowed or disked and the soil would be harrowed and worked constantly all through July and August. This harrowing would be done at least 16 times before grass seeding—the object being to kill out all the old sod and the weeds and make a fine and level seed bed. After this long and thorough fitting about twice the ordinary quantity of Timothy and Red-top seed is used *alone*—without any grain crop whatever. The other plan means sowing buckwheat and turnips after the stubble has been plowed under. This crop will make a good growth in late Summer and is plowed under in early September, after which the ground is fitted and seeded to the grass. At the time of seeding 600 pounds per acre of a good grass fertilizer should be used, one of the high-grade commercial mixtures or the following chemicals. One part nitrate of soda, three parts fine ground bone and one part muriate of potash—all by weight. On most New England soils it will pay to use a ton of air-slaked lime to the acre after plowing under the peas and oats stubble. The plan of "intense culture" through July and August will prove more expensive than the other, but it will give a better seeding and a more permanent meadow.

Sowing Oats With Canada Peas.

In advising the sowing of oats and peas for hay, you say "plow the peas under and harrow in the oats." What do you mean by "plow the peas under"? I raise oats and Canada field peas every Spring for cow feed, but the peas never come up right. Perhaps I do not cover them deep enough. Does "plow the peas under" mean the peas should be broadcast on the land before the land is plowed and then be plowed under? Please tell me how to put in a crop of oats and Canada field peas to get best results. G. D. B.

To seed oats and peas on a small scale, the peas are first scattered on top of the ground before the soil is disturbed in any way. Above five pecks are used to the acre. Then with a small plow gauged to run above five inches deep, these peas are plowed in. In some cases a disk-harrow well weighted down can be used for the same purpose. The object is to put the peas into the ground about five inches below the surface. When this has been done, about three bushels of oats are spread broadcast on top of the furrows and then thoroughly harrowed in. This will leave the peas above five inches under the ground and the oats about two inches—the peas needing a deeper root system than the oats. The oats come up first, quickly followed by the peas, which, when they begin to run, find strong and high oat plants around which they may twine and thus keep off the ground. In some cases where large areas are put into oats and peas, farmers use an ordinary grain drill, mixing the peas and oats together, and sowing about three inches deep. This gives a good crop, but the peas will generally do better when they are put down deeper into the ground below the furrows.

The Loss of Soil.

According to an estimate by Sir John Murray, the total annual rainfall upon all the land of the globe amounts to 29,347.4 cubic miles, and of this quantity 6,524 cubic miles drains off through rivers to the sea. A cubic mile of river water weighs, approximately, 4,205,650,000 tons, and carries in solution, on the average, about 420,000 tons of foreign matter. In all about 2,735,000,000 tons of solid substances are thus carried annually to the ocean.—United States Geological Survey.

This is what you may call dealing with large figures. One acre of soil one foot deep weighs about 2,100 tons. Thus the average loss by this washing means over 1,367,000 acres one foot deep, or an area nearly as large as the counties of Delaware, Cortland and Chemung, N. Y. This represents what is washed into the ocean each year! The question is how much of this is yearly contributed from your farm? How much of it can you prevent? Deep plowing and drainage will send more water into the soil instead of over its face, and cover crops and terraces will hold the flowing water back and help hold your soil where it belongs.

Oldenburg Apples Dropping.

Can you explain the reason for a healthy vigorous tree, Duchess of Oldenburg, not holding its fruit to maturity? It has had good care. A few apples matured and they are excellent in every way. It is generally covered with blossoms each Spring. H. D. W.

It is hard to even guess why the Oldenburg apples drop without fuller knowledge of the circumstances under which they are growing and the care the tree receives. When does the drop occur? What is the condition of the fruit that drops? Is the tree sprayed and if so with what? I know a man who used lime-sulphur for Codling moth and claimed he had fine results. Codling moth may be responsible for the early drop. With me Oldenburg is an early and heavy cropper. Trees set in 1909 last season gave from a peck to a bushel to the tree. It does not ripen the crop evenly, and needs two or three pickings to get all the fruit in prime condition. Some of the fruit will drop fully matured while some will still cling to the tree green and hard. If H. D. W. will spray thoroughly I think he can probably secure a fair crop. G. R. S.

41A

NEW YORK STATE NEWS.

TUBERCULOUS CATTLE.—A hearing was given by Commissioner Huson on April 13 upon the charges that the carcass of a bull killed by order of the State authorities at Kingston, and found to be tubercular, was afterwards sold in Poughkeepsie. Several witnesses were examined. The inquiry developed the fact that some of the State veterinarians have been lax in the performance of their duties in regard to the slaughter and destruction of condemned cattle. This condition will be at once remedied by Commissioner Huson who has issued specific orders that the letter of the law must be complied with in every instance. It appears that the stamps supplied by the department for marking condemned carcasses were not kept in the personal custody of the veterinarian at Kingston, but "in a desk in the slaughter house and it was possible for anyone to have abstracted the stamps and used them without his (the veterinarian's) knowledge." The veterinarian believed that the "condemned" marks, in this particular instance, had been cut off and the "passed" marks substituted. The proprietor of a slaughter house said that it was quite possible for anyone to cut off the stamps and sell the carcass for food. The hearing is to be continued as soon as other facts are secured.

MORE CITY LABORERS.—Another carload of city laborers for the farm goes to Ogdensburg and to points in Jefferson County. It should be remembered that the labor bureau of the Department is constantly supplying farmers with help, in answer to the 25 applications, on the average, received at the Department daily. Already about 1,000 have found work on the farms of the State this season, and it is believed that 4,000 or 5,000 will be placed before the harvest season closes. Since the establishment of the labor bureau in 1905 about 35,000 men have been given positions on farms.

LEGISLATURE TO MEET MAY 4.—Gov. Glynn has called the Legislature in extraordinary session for May 4. He has announced that the only matters to be considered will relate to financial legislation. He says: "The Legislature during its closing hours passed over 650 bills and sent them to me for approval or disapproval, and over 50 requests have been made of me to submit to this session matters for legislation which proponents claim to be of importance. We have too many laws and in recent years we have had too protracted sessions." With this statement about 99 per cent. of the people of the State will agree without argument.

HIGHWAY BILLS VETOED.—The Governor refused to sign two bills relative to the purchase or lease of machinery for road making. One of these is the Thorn bill which would validate contracts made by town officers for the lease of highway machines. There are more than 500 such contracts between the manufacturers of road machinery and town boards and according to the Governor "these contracts represent a direct evasion of the highway law and misapplication of over $1,000,000 of the State's money." He holds that the law does not permit the use of money appropriated for repair and improvement of highways, for the purchase of expensive road machinery. The Governor also vetoed the bill which would increase the amount which a town can appropriate for road machinery from $500 to $1,000 without the vote of a town meeting. Says the Governor: "If the townships of the State are to purchase machinery I believe that the purchase should be made in open meeting where every taxpayer will have the opportunity to be heard."

SALT INDUSTRY.—It may not be known to many that the salt output of this State is practically one-third that of the entire country. The mines and brine wells were very actively worked last year and their output was 10,819,521 barrels, which was an increase of 317,307 barrels over 1912; that exceeded the amount produced in any previous year, and the records go back to 1797.

STATE WILL MAKE BRICK.—The Governor has signed the bill appropriating $25,000 to erect a plant for the manufacture of brick for use in constructing highways. The works will be established at the Elmira State Reformatory and convicts are to be employed in the work of brick making. This is the first step in the Governor's plan to have brick used more extensively for road making and the employment of prison labor for the purpose.

NATIONAL MILK ASSOCIATION.—The American Association of Medical Milk Commissioners is the lengthy title of an organization that will meet in Rochester on June 19 and 20. Dr. John W. Kerr, assistant surgeon-general of the United States Public Health Service, is president of the association. The object of the convention is to improve the milk supply. The program presents a list of notable speakers from several States who are experts on the question of milk production and supply. There will also be two contests, one a national certified milk contest open to all, and the other is a market milk contest open to all producers who ship milk into Rochester.

ONE SIGNED, ONE VETOED.—Gov. Glynn has signed the bill to amend the labor law in relation to the hours of labor in mercantile establishments. It reduces the number of hours in which children under 16 years may work from 54 to 48 hours in any one week, and from nine to eight hours in any one day. It also prohibits their employment after 6 p. m. instead of after 7 p. m. The vetoed measure related to the sale of canal lands that have been abandoned. The Governor objects to the bill on the grounds that it should not become the policy of the State to permit municipalities to secure public lands, for which the people were originally taxed, for less than their real value.

HOLSTEIN MEN TO HAVE SPECIAL TRAIN.—The Eastern States will send a big delegation to the national association meeting of Holstein Friesian breeders at Chicago on June 2 and 3. They will leave the day before the convention on a special train and many will be accompanied by their wives. This is the first time in many years that the annual meeting has been held outside Syracuse, and the western breeders are planning to give the convention a royal welcome and an exceptionally good time.

FORESTRY SCHOOL DEDICATION.—The formal opening of the new building devoted to the forestry school at Cornell will take place on May 15 with appropriate exercises. Among the speakers are Gifford Pinchot, Dr. L. H. Bailey and Henry S. Graves of Washington. On the following day the annual meeting of the Society of American Foresters, the national professional forestry association, will be held at the same place. This will be the first gathering of this society outside Washington. J. W. D.

Reports from Western New York show great damage to peach buds. Inspections of many large peach orchards in Orleans County show that the peach crop has been Winter-killed, and in several orchards where tests were made there are no prospects of any kind of a crop of Elberta, which are the best commercial peach here. Tests in an orchard where a usual crop of 4,000 bushels is harvested showed only one fertile bud alive out of 500.

Apples sold last Fall for $2.50 a barrel; No. 1 and No. 2 potatoes sold this Winter for 50, 55 and 65 cents a bushel. Good cows $75; cream, January 39, February, 37 cents, butterfat. Pigs, four weeks, $4; pork 12 cents pound.

Garland, Me. E. R. R.

Protection

The roof that fails to give protection, fails in its mission—protection against rain, snow, hail, heat, cold, sun's rays, etc. You get this protection and more under

"RAIN-TIGHT" Rubber Roofing

In a degree you get fire protection also, as sparks falling upon "Rain-Tight" Roofing will not burn.

It is made of Trinidad Lake Asphalt—the standard asphalt of the world. It is the same material that is used to make city pavements, which withstands the constant pounding of horses' hoofs and heavy-laden wagons.

Our brand of "PERFECT ROOFING" is the same as "RAIN-TIGHT" with Mica Flakes added to the surface, which make it fire resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

PERFECT ROSIN-SIZED SHEATHING AND PERFECT-TARRED FELT ARE BEST FOR SHEATHING PURPOSES

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us to-day.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 492, March 28.*)

Nate had ground away at the buffalo horns too, with unceasing zest, on rainy days, or days when Jim's team was too busy in other ways to be used for hauling the bones to the dumping place. To a boy like Nate, who had been accustomed to receive regular wages, this wageless life seemed peculiarly difficult. He knew that Norm was furnishing much more in every way in this partnership than was he. What could he do, where there was no chance for paid work—and someway he fell asleep thinking of black, shining buffalo horns.

Norm had cut and cared for the hay that grew on the valley plat, and it looked to him like a goodly supply for Winter, even should it be less open than the older settlers agreed to be common. It was too early to do Fall plowing, even should it be feasible to do it, and that would depend much upon whether it rained enough to make the breaking possible.

One fine day in September, Nate and Norm drove into the city, and Nate received several bulky letters and some thin ones, with circulars and catalogues. He was quite excited over these, and he tore open a catalogue and running through the pages swiftly, turned to poultry supplies, and bone cutters.

"Gee, but they do cost quite a bunch," he told himself, but even so he determined to have one, sometime, if he could raise the price. The balance of his mail he stowed away carefully, but the very sight of that pictured bone cutter sent his blood thrilling through his veins. He believed he could make that machine pay for itself and the thought of a real, commercial transaction, however small, was a thrilling thing just then. They had attended to the few small items of business they had to do, and were standing on the street corner, idly enough, watching the people surging about, all seeming alert, and intent upon getting somewhere in the shortest possible space of time, when a big, cheerful looking man in blue denim accosted them:

"Say, you! Are you looking for a job?" a hearty voice asked, and a pair of clear eyes, looked at Norm's husky figure approvingly.

"Yes," replied Norm, instantly, although up to the time he met the speaker, he had not been looking any further than his own plat of land for employment.

"I want a good pitcher on my steam thrashing outfit. Fellow left me in the lurch this morning. My name's Tom Miller."

"Sure," Norm assented simply, and his face shone as though a voice from heaven had accosted him. "Work, work, paid work," his inner consciousness kept singing.

"Come on then, we're just starting out. Hope I haven't robbed you of a man," Tom Miller said, turning to Nate questioningly, touching his rough cap as he spoke.

"Not at all," Nate replied smiling, "I'm not hiring any help just now."

"Lucky!" Tom Miller added. "Men are scarce. Don't know of anyone who wants to go for a cook, do you?"

"Yes," Nate responded quickly. "If your crew are not too fastidious, I'd like to sling hash for them for a spell."

Tom Miller, looked at Nate's neat outfit, his slim brown hands, his rather delicate, but fine face, his broad, yet sunken chest, and his shoulders, which were stooped.

"Lunger!" was Tom Miller's correct mental comment, alound he said. "We pay the cook the same as the thrasher. You look as though you could wrestle with pots and swing a dishrag. Come on!" and Tom Miller plunged forward as though all he had to do in life was to say to others, "come," and they should follow.

"I'm peculiarly expert with dishrags—and fond of them," Nate added whimsically measuring his stride to that of Tom Miller.

"Hold on a minute, Mr. Miller," Norm said. "We've got a yoke of oxen with us, and we'll have to picket, or stall or stable them somewhere, we can't leave them hitched to the wagon in the street."

"Fetch them along, grazing's free—you may get a chance to work them some in shock thrashing—but they're most too slow—everything is done with a slam and a rush out here." And with this Tom Miller, untied his team of splendid draught horses, and climbed into the lumber wagon. "Follow me, I live out about 10 miles southeast."

Nate hustled to untie the oxen and Norm sent them scurrying along the road following the cloud of dust which he saw in the distance. The two boys looking at each other gravely and then, with eye answering to eye, they both broke into a hilarious laugh.

"Glory!" said Nate.

"Hot dollars!" exulted Norm.

"How glad I am I have attended cooking school this Summer," gurgled Nate, with a sort of "prunes and prisms" dignity.

Then both lapsed into silence, broken only by Norm's guiding calls to his oxen, a "gee," here or a "haw" there, or a "giddap Reddy, hustle along Roan."

"The chickens!" blurted out Nate after some miles of silence.

"And the setting hens and the cat!" appended Norm.

"I rackon Jim'll take care of them when he finds we don't get back," Nate said easily.

"The cat can catch gophers enough for her living, and I'm sure Jim'll see to things," Norm said, but he felt a little uneasy, although it was a common thing for one young land-holder to "see too" some ones' else affairs, if the owner chanced to get home late at night. A state of affairs quite common, for the distances were long in that new country, of many settlers and few cities.

Nate found himself introduced to a cook shanty, a small building on wheels, which could be drawn from one thrashing place to another. In this shanty were long shelves on either side, for tables, benches to sit on, and a narrow runway between, where the cook was supposed to move as he passed the food. A range in one corner, with monstrous kettles, and cooking dishes, flour bin, sundry supplies, and so on.

"You two can bunk in together if you want to," Tome Miller said in leaving. There's springs and mattress, with blankets furnished for the cook, who's supposed to sleep in the cook cabin. Blankets and a tent for the other men."

"We'll bunk outside," Norm said, cheerfully.

"Never sleep indoors unless it rains," Nate assented, "and we don't either one know what springs and mattresses are."

"Men must get to work as soon as they can see, so breakfast'll have to be ready and eaten before daylight."

"All right," the new cook responded, as he watched Tom Miller plunge away. "Now I'll hop to it, and see what the cook can find for breakfast," and laughing and talking the two boys explored the contents of every utensil in the place, finding the supplies, good, abundant, and comfortable. It was pretty late when they wrapped the blankets about them, and slept under the clean September sky. And it was early, very early, when Norm dragged Nate from his slumbers and set him pottering over the cook stove.

Both boys worked briskly, and deftly, for they were accustomed to a limited space and it seemed good to have such an abundance to draw from for the meal.

The whistle blew for breakfast, and Nate stood, waiting for the coming of the crew. "I hope my halo is on straight," he whispered to Norm as the onslaught began. But he forgot all joking in the work before him, as he poured cup after cup of coffee, and dished up plateful after plateful of crisp bacon.

"This tastes like real cooking," one of the men affirmed, smiling up at Nate cordially.

"It sure does," agreed a second, and someway, Nate felt as though his halo was not only on straight but shining rather brilliantly.

For four weeks the boys worked harder than they had ever worked in their lives and at the end of that time they had learned many things. They saw how grain is handled in the West, they caught the real Western spirit, of push, and rush and enthusiasm. Every worker was a friend and brother to every other worker, but the drone had no place, and was pushed out as soon as he was found, in that busy hive of workers. When at last, Nate hung up his final dishrag, washed out the last towel, put away for the last time the tin cups and plates and dishes and slipped a cook book, he had smuggled in surreptitiously, into his pocket, with a little sigh of satisfaction.

"Good bye, men," said a heavy bass voice, and Nate looked up to see the crew gathered about the shanty door.

"Hello boys!" he cried joyfully.

"We've made up our minds you've done yourself proud on this trip, and we've brought you a little present," said the spokesman, and forthwith handed out a package.

Nate caught it, yanked off the string and held dangling in his hands six gingham aprons. He flushed, and then catching the spirit of the joke, he jumped up on the table and cried. "Hear, hear. Here's thanks to you, and may you everyone find a gingham apron in your home some day."

"The same to you, the same," and then followed a pandemonium of delight, as Nate carefully replaced the aprons in

How To Make Your Garden Thrive and Mature Early

The kind of plant-food required in your soil depends on the kind of a crop you are to raise. In order to make your garden produce its maximum yield at the lowest cost for fertilizer you should supply only those elements which are immediately available and which will be absorbed by the plant.

Consumers Brands

For Gardeners, Fruit-Growers, Florists and General Use

Comprise special distinct compositions of plant-food elements for vegetables, small fruits, root-crops, flowers, greenhouses, lawns and tree-crops. They supply only the constituents your particular soil needs for some special crop. For example our

Early-Crop Odorless Fertilizer

supplies your soil with the four plant-food elements in immediately available form needed by vegetables and small fruits for quick growth and early maturity. It is the most effective and convenient fertilizer you can apply for such crops and in the end the most economical.

Write today for our *free* Fertilizer Booklet—it is full of valuable information and is as valuable as a text-book on soil fertility.

Special Parcel Post Offer

Our Mak-Gro Odorless Plant Food is a clean high grade granular fertilizer for indoor and outdoor use on potted plants, flowerbeds, small fruits, lawns and small gardens. It is *made especially for the amateur* and is pleasant to apply. We will mail a five-pound bag to any address for $1.00. Write today for special circular.

The Long-Time Car

Reo the Fifth

may demonstrate no better than some lesser cars. It may even look no better. But the chassis is built, in the hidden parts, like no other car in this class. And the results will show in time.

Reo the Fifth is built to endure. It is built for safety, for low cost of upkeep, for long years of perfect service. The man who builds it has for 27 years been learning how to better cars.

Takes Six Weeks

It takes six weeks to build Reo the Fifth. Days are spent on tests aud inspections rarely applied to cars. Days are spent to get utter exactness, by grinding and regrinding.

All steel is twice analyzed. The most radical tests are applied to each part. All driving parts are made to meet the requirements of a 50-horsepower engine. That means 50 per cent over-capacity, at least.

We use 190 drop forgings—15 roller bearings. At much extra cost we use a clutch which prohibits clashing gears. And gears are shifted by a three-inch movement of the hand.

To get super-strength and freedom from trouble we add about $200 to the necessary cost of each car.

Must Stay New

To prove out this car in every part we keep test chassis running on the road. They are run night and day at high speed. After 10,000 miles we take the car apart and inspect it. And the requirement is that every vital part shall remain about as good as new.

New Features

This year we give you the streamline body. We give you the best system of electric starting and lights. We give you dimming searchlights, and many new ideas in equipment.

And we give you a price $220 less than last year, with electrical equipment. This is due mainly to the fact that all our special machinery has been charged against previous output.

This car will save the average user hundreds of dollars because of our extra care. And legions of men know this.

Ask us for address of nearest dealer. We have them in a thousand towns.

their wrapping and buttoned the package inside his jumper.

When Tom Miller paid them off in real green money, the boys could hardly contain themselves.

"I've only paid the other men two fifty a day, but I'm going to make your wad an even hundred apiece, for your the bang uppest workers I've ever had in my kit," and Tom Miller shook both cordially by the hand. "Now you're both engaged for next Fall, remember."

Riding slowly homeward in the crisp October morning, with Red and Roan as sleek as a pair of kittens, Norm said, reluctantly, feeling himself almost like a traitor to his own traditions, "Red and Roan are all right for oxen—but if we get any crop at all we've got to have some horses another year."

"Yes," Nate agreed joyously. "We ought to have them before Spring work. We can't afford not to have them, and we've got to have a cow and a pig."

"There won't be any paid work this Winter," Norm cautioned.

"Oh, for money, to go on and develop things! I never supposed it cost anything to farm, but I'm going to get the biggest bone cutter I can find with part of my money, and the rest you can blow in, to suit yourself."

"Bosh, on a bone cutter, you might better buy your Winter flannels," Norm grouched. But he looked indulgently at Nate as he sat, with his shoulders nearer squared than he had ever carried them before.

They stopped in the city for a little rest, and fed the oxen, and themselves and then started on the home stretch, for miles they went silently, dreaming, thinking, thrilling with the joy of life, and all its gladness, for some way this adventure on the plains never dulled, never lost its zest or fullness.

"Why—ee—This begins to look like home, we're almost home—oh, the home trail, the home trail," chanted Nate joyously.

"It does look good, even that shale bank, and the hill and all—why—how queer things look—that isn't our house on the hill!" Norm sat up wide-eyed, and Nate stared incredulously.

"It certainly isn't the shack we left, but it's our place," Nate cried, startled.

Jim Maynard came running out to meet them, for he had sighted the oxen far away on the plains.

"Where in heavenly hades, have you been?" Jim inquired indignantly. "How do you expect a fellow to hold your land for you, and you traipse off like this? How was I to know you were coming back? Your claim is jumped. A fellow by the name of James is on it, shanty, cow and all. His shanty has blown down three times, but it hasn't discouraged him any, he's set it up again."

Jim looked at the boys knowingly, and laughed, but the faces of neither Nate nor Norm showed any understanding.

"You see," Jim explained definitely, "the wind rose very suddenly three times while the tenderfoot was away, and the shanty fell all to pieces."

"Oh," gasped Nate, "I see, you fellows pulled it down."

"I should call it a very-local-hurry-cane," Norm admitted slowly, the humor of the situation dawning on his perturbed mind.

"He's got possession, and possession is nine points of the law anywhere and about ten here," Jim said gloomily.

"It looks pretty bad," Norm admitted gravely.

"Is he religious?" Nate inquired naively. "Let's go along and have a little Sunday school talk with him anyway."

CHAPTER V.

THE INDIAN UPRISING.

"We'll just jog along, and have a little Sunday School talk with him," Nate reiterated significantly.

Jim, scenting some break of the usual monotony, jumped into the wagon and crouched down out of sight, where he might hear and yet not be seen. Norm drove up to the newcomers shanty and stopped.

"Hulloo!" shouted Nate cheerfully.

The door opened and a short, determined looking individual appeared, looking askance at the two boys.

"Got any chickens to sell?" Nate inquired blandly, with his most fatuous look of innocence and friendliness. "I see you have some fine lookers here."

"Naw," replied the man, "I've been eating all I could spare. I have some hens setting though, and maybe later if you wanted to get a pair or two—My name's James, John C. James."

"You don't happen to have any frame house you want to dispose of do you?"

"Nary one," Mr. James negatived, with a sharp look at Nate's impassive face.

"If that's the case, you'd better tote that one you're in off this place, for this land belongs to me and I've got the papers to show for it. Besides I can prove that you've been stealing my chickens and eating them, by your own admitting." Nate's voice was still bland and indulgent, and a pleasant smile wreathed his ingenuous face.

"I can prove," Mr. James countered sharply, "that you haven't lived on this place, nor fulfilled the law concerning it. I've got possession and I'm going to keep it. It's a good grazing place for my cow. That shale bank hain't no good for anything else." There was a furtive glance at the shale bank, where Mr. James had evidently been digging some.

"Shall we let him have it, brother?" Nate turned to Norm inquiringly. "He says it isn't any good anyway—and yet he seems to want it!" musingly.

"Why yes, I guess we may as well let him have it," Norm paused, and Mr. James looked pleased at his decision, which Norm modified in time by adding casually, "Till tomorrow, then I'll be bound he'll be taking kindly to moving off."

"That's the word. We'll give you time to pack up, and dust out decently," Nate said, and then scanning the sky, he remarked drily, "It looks to me as though this would be an awfully unhealthy place for you after tomorrow. I'm positive that by night there'll be a tornado—or SOMETHING!" There was a firm set to Nate's lips, although he spoke in an easy, bantering tone.

"Enough said," Norm agreed. "Till tomorrow then!" and both boys touched their caps to Mr. James who seemed almost at the point of spontaneous combustion. "I'll sally forth and mosey on," Norm said nonchalantly; turning Red and Roan Norm drove down into the little valley by the creek, and unhitched, tethering his oxen in the rich grass.

"What are you going to do?" Jim inquired admiringly, creeping out from his hiding place.

"Do?" stormed Norm. "We're going to hold this land. We've got to fix up better anyway. I've got some lumber right here, and I'm going to town tomorrow and get another load, and if that critter isn't off that place when we get back, he'll have to take his medicine, that's all."

Nate looked at Norm admiringly, but said drily, "Don't let your angry passions rise, Normy. Our esteemed tenant is scared plum out of his wits."

"Scared?" snorted Norm. "He's just about as scared as a bulldog with a bone, worried by a terrier. He's got a cabin as square as a mansard roof."

"La, me!" responded Nate daintily, "and I'm boodooed with a dimple," and he put one slim, brown hand up to the offending beauty spot in his own chin, which was rather good to look at if nothing more, "I wish I could fill in that ornamental cavity," Nate added disconsolately.

"I have a cavity much greater, and less ornamental, which I shall proceed to fill up with bread and bacon," Norm said savagely. "Now stop your being funny and take hold there, you graduated cook you!"

"Correct," Nate replied still pleasantly, "but, oh, my gizzard! If Mr. James don't get icicles on his tenderloin before midnight tomorrow, I miss my guess." Nate was busy making a little fire and slicing thin slices of bacon. Then toasting some crisply, handed it to Norm. "Assuage your grief, and may your good nature ever be more!"

"He's been living intemperately high, for the last month and he's got delirium tremens as a result. He'll be seeing things in a minute." Norm spoke gruffly, but he looked at Nate with a look as full of adoration as can be put into one pair of human eyes.

"I see!" Nate paused, a piece of bacon in midair. "Why, I heard something about Indians and ghost dances, in the city to-day. Did I hear it or is it merely the nightmare of good living, gone to my brain?" Another long pause, in which all three boys ate bread and bacon, and drank coffee to their heart's content.

"Hey," cried Nate, "but I have it, I have it sure!" But what he had he did not say. If there had been anyone to see, they would have seen three boys with heads close together, and with voices so low, they could scarcely be heard above their breathing, and finally Jim crept along the valley and disappeared, keeping well out of sight of any eagle eyes that might have been watching in the shanty.

The next morning long before light, Norm started for the city, while Nate by means of a long detour reached the back of Jim Maynard's shanty, where he found Jim, himself wide awake and listening for him.

"You take my horse," Jim whispered, and then his voice sank so low that none but Nate close by could hear a sound, but in a few minutes, Nate rode off with the horse's hoofs muffled with grain sacks, carrying carefully, a couple of cans that were labelled, "Paint."

About eight o'clock a foam-flecked steed drew up in front of Jim's shanty. There was a wild "Halloo!" which brought not only Jim, but Mr. James to the open. Whereat, the new-comer, waved his arms wildly, crying out, in an excited voice. "The Indians, the Indians! There's been ghost dances for three days and nights, and that is a sure sign that"—the voice paused significantly.

"Indians! And you're out warning the settlers!" gasped Jim.

"I'm pulling out, and warning as I pass along—I'd hate to think of this country swimming with blood and reeking with bodies of the settlers!" There was horror in the voice, and the man's face was unnaturally white.

Jim gave a shrill whistle and waved to Mr. James, and that gentleman hurried to the spot, for the conversation, had been excited and quite loud enough for him to catch its import.

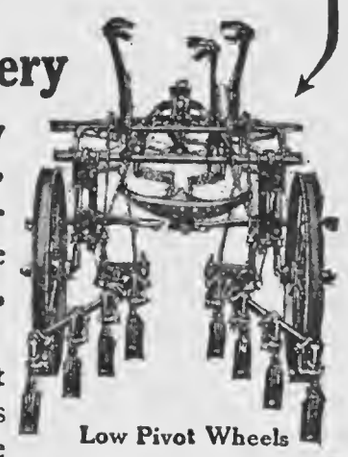
"Indians." Jim ejaculated hoarsely. "Indian up-rising out beyond the river—ghost dances"—and with a hurried look backward, the rider put spurs to his horse and plunged away.

(Continued next month.)

POTATO GROWERS

Everywhere realize that the profits from any stand depend, largely upon choosing the tools that are designed especially for potatoes—that carry every convenience and every adjustment to handle the crop in the most practical way, from planting until after the harvest. You can find everything that is needed in the full line of

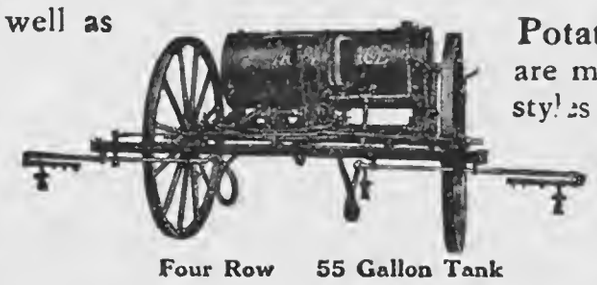
IRON AGE Potato Machinery

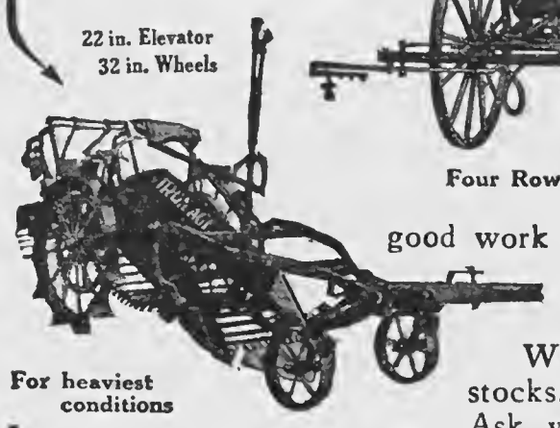


100% Planters place one seed piece in every space and one only—no skips to eat up fertilizer, labor and land, or doubles to waste expensive seed.

Steel-Frame Riding Cultivators are made with high or low, pivot or fixed wheels, grooved, flat or zig-zag gangs, for one or two rows, etc.

Traction Sprayers cover four or six rows at a time. Special spray bars for different crops including a new one that covers the underside of the leaves as well as the top.





Potato Diggers are made in four styles and when rightly chosen each is guaranteed to do as good work as any other digger of the same size and capacity on the market—better than most.

We have thorough distribution of stocks. Now is the time to order. Ask your local dealer to show you these tools and write us for set of booklets showing them in illustrated form.

BATEMAN M'F'G CO.

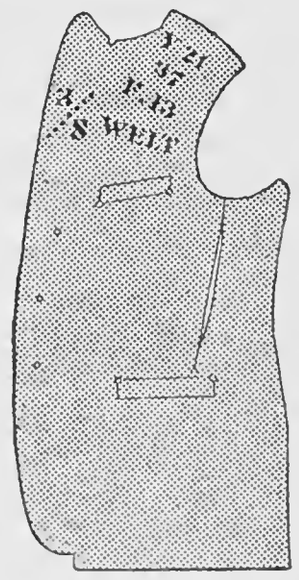
The Comfort of "5130" Begins with the Pattern



One reason why No. 5130 Clothcraft Blue Serge Special is one of the most successful suits for men is because it is so well designed.

The time and money devoted to designing the patterns are well spent, for they result in a comfortable, easy fit. The suit keeps its shape and every detail of collar, sleeves, pockets, armholes and so on, is just right.

It doesn't cost you any more either; for doing each little operation in the one best way also means saving time and money.

It may be only a fraction of a minute in sewing a seam, or in trimming a lining, but altogether it means a good many dollars. That saving comes back to you in the painstaking work of the designer, and in better and better material and workmanship.

And, remember, Clothcraft is the one GUARANTEED ALL WOOL line of men's ready for service clothes at $10 to $20.

Drop in at the Clothcraft Store and see for yourself the substantial value of No. 5130 Blue Serge Special at $15.

Write for the new Style Book and a personal note of introduction to the nearest Clothcraft dealer.

There is also a fall-weight Clothcraft Blue Serge Special at $18.50 known as No. 4130.

This label on every Clothcraft Suit. Our signed guaranty in the pocket of every coat.

Rights of Adjoining Property Owners in Highway.

Has a New Jersey property owner control to the road? Can a neighbor place a post with a mail box on it, on property that he—the neighbor—doesn't own, rent or control? Assuming that Mr. X, my neighbor, has placed a mail box along the road fronting my property, have I the right either to remove it myself or tell him to take it away? F. A. W.

New Jersey.

The general rule is that the owners of adjoining property own to the middle of the highway, and, subject to the rights of the travelling public, may exercise ownership over it. In this instance it does not appear that there is any law which would give your neighbor the right to put his mail box on your side of the road, but there may be regulations of the Postoffice Department requiring people who live off the road and who wish their mail delivered by rural delivery to furnish a mail box and, if no owner along the road would allow them access, they would be deprived of this privilege and this seems hardly equitable. There is no doubt that you could make him place the box where it would not interfere with you and your use of the road, but it seems also that he ought to have some place along the road where he can place his mail box.

Maintaining Fence Along Railroad.

Is there a law in the State of New Jersey compelling railroads to build fences along their properties where they adjoin farms? In this particular instance, I am trying to get the Pennsylvania Railroad to build a fence where it adjoins my farm. The representative of the company claims their deed does not specify that they shall build a fence, and my deed does not specify either. They want to make an offer as to what I will do. But they seem so willing that I should make them a proposition, that it seems to me there must be a loop-hole somewhere. Can you advise me in anyway? The amount of fencing, as called for in the deed—that is, in distance—is 13 chains and 84 links. How many rods is this? How many rods in a chain?

New Jersey. W. P. M.

Section 21 of the General Railroad Law of New Jersey requires "every company organized under this act to erect and maintain fences on the side of its road of the height and strength of division fences required by law, with gates or bar-ways at farm crossings."

You will note that this is made to apply to companies organized under the New Jersey laws, while the Pennsylvania Railroad is a Pennsylvania corporation. It would seem, however, that if this company avails itself of the New Jersey laws, it must also comply with them, and it would probably be well for you to notify the company that the fence is in disrepair and that you wish, if such be the fact, to keep stock in the field and that you will hold them responsible for any damage done to the stock if they get upon the railroad track.

There are four rods in a chain, which is 66 feet long.

Mortgagee's Interest in Insurance.

In 1905 I bought a farm for $2,600, subject to mortgage of $1,900, with an old house, a barn unpainted, built about 20 years ago, and some old rickety outbuildings, house and farm being insured for $300 each, total $600. Between 1905 and 1911, the buildings were as described, except rickety outbuildings either fell down or were torn down, as they were too rotten to be of any use. In 1912 I built a new house, costing about $3,000 with all modern improvements. I have house insured in one company for $2,000, in another company, the house for $300, barn $400, contents $100, cow barn $200, total insurance $3,000, the original insurance of $600 being annuled. The law firm that holds mortgage now write me they want my insurance papers to protect their client in case of loss if any, and must be made payable to client.

New York. T. C. T.

The interest of the law firm and the mortgagee in your insurance is governed entirely by the terms of the mortgage. Nearly all mortgages contain the clause that the mortgagor shall keep the property insured for the benefit of the mortgagee, and this clause varies to suit the wishes of the parties. You should ask to see your mortgage, and if you are to keep the property insured, you will probably have to do as the lawyers wish, but in no event are you required to turn over to them any more than the amount of their mortgage in case of a fire; and if you turn over to them as much as the full amount of the mortgage, then the property would be free of the mortgage.

Rotation for Melons.

Will muskmelons and watermelons do well on same ground two years in succession, or must I change ground? I had a good crop last year. P. L. F. J.

Walden, N. Y.

It will depend upon the soil. If melon insects and diseases were plentiful last year we would plant elsewhere. If the soil was quite free from these pests and the soil is naturally good we should follow with melons.

Homemade Tobacco Extract.

For some years the entomologists have strongly advised the use of tobacco extract for fighting various kinds of insects. It has come to be a regular proposition to use the extract alone, or in combination with other materials. This has led many farmers to ask why they cannot make the tobacco extract at home. Their proposition is to buy the stems or waste tobacco, steep it in water, and use this broth or liquid for spraying. From this have arisen questions as to the proper strength to use, or for determining just how to make a standard mixture. We have sent this question to some of our leading entomologists, asking how a farmer may know when the tobacco extract is the proper strength. How many pounds of tobacco should be use to a gallon of water, for example, and how long should it be boiled or steeped? The following statement is made by Prof. H. E. Hodgkiss, Asst. Entomologist, at the Geneva Station.

"Tobacco extract as prepared by the fruit-grower varies greatly in its insecticidal properties. This is due to the methods of making the preparation and the variation in the proportion of nicotine in tobacco. The alkaloid varies in amount according to the locality in which the plant is grown and to the parts of the plant from which it is extracted. The variation in the quantity of nicotine probably accounts for the little use of homemade decoctions in commercial plantings. The chief advantage obtained by the employment of standard nicotine preparations is that the amount of nicotine is constant, which makes it possible to obtain dilutions of definite strengths. The reasons for differences between homemade and commercial nicotine preparations are recognized, and I will consider them under the following headlines: 1. Ordinary tobacco juice; 2. standard nicotine preparations.

"1. The ordinary juice is obtained by a methodical steeping of the unused parts of the tobacco plant, such as trashy leaves, sweepings of warehouse and the wastes of manufacturing. The density of the extract and the amount of the nicotine vary according to the nature of the tobacco and the processes and extent of the steeping. The liquid is strongly colored and ferments on standing.

"2. Standard nicotine preparations are obtained by distilling ordinary tobacco juice. The vapor from the retort is conducted over sulphuric acid, giving nicotine sulphate and acid. A standard nicotine preparation contains a fixed amount of nicotine as nicotine sulphate and small quantities of sulphate of soda, carbonate of soda and certain organic salts. The liquid is clear, does not ferment, and possesses the distinct advantage over ordinary juices that the amount of nicotine is constant and is guaranteed. Since the nicotine preparations at guaranteed strengths of nicotine were placed on the market and were found to be constantly efficient, we have not advised the use of homemade tobacco solutions for the reasons as stated above; and we believe, from our own experience in making the preparations from tobacco stems, that it will be more profitable to the growers to purchase the material containing a guaranteed per cent. of nicotine than to try to make it themselves.

H. E. HODGKISS."

OKLAHOMA AND THE 35-CENT DOLLAR.—This question of the 35-cent dollar is moving faster than any other national thought. Even in Oklahoma, an agricultural State, the question of the great difference between the producer's and the consumer's prices is coming up. In the comparatively small town of Stillwater, Okla., on March 14, grocery stores were offering new potatoes at 10 cents a pound, or $6 a bushel. These potatoes were grown on truck farms in Louisiana and Texas, only a few hundred miles away, and they were grown by men who found little or no profit in their culture. Such situations as these ought to bring the matter directly home to both the farmers and consumers, and wherever we go we find the same tragedy of the price to the consumer worked out. It is a good thing that people all over the country are coming to realize what this 35-cent dollar represents, for they never can do anything to help solve the problem until it thoroughly works into the mind that this condition means far more than high price to the consumer, but also a robbery to the producer.

David Bradley Little Jap CULTIVATORS

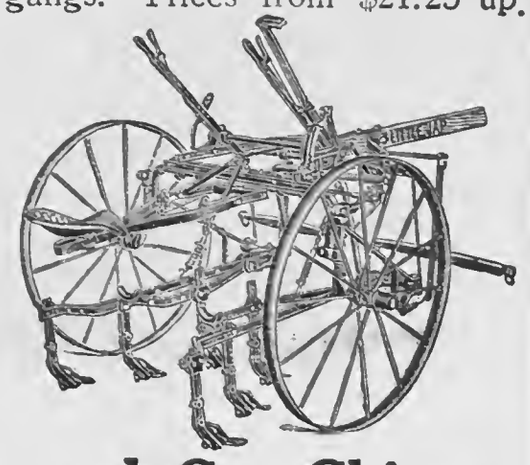
Even if we asked as much as others, the Little Jap would still be the greatest cultivator value on the market. We guarantee it to please you better than any other cultivator you can possibly buy or we will gladly refund your money.

The Bradley line includes single row and double row riding and walking cultivators of all kinds. You will find them fully described in our big General Catalog, but if you want our new Cultivator and Implement Book, which describes our complete line of Bradley cultivators, harrows, plows, planters, etc., besides buggies, wagons, harness, gasoline engines, supplies for dairymen, poultrymen, fruit growers, etc., just say "Send me Cultivator Book No. 66R64

NO other farm implement of modern times has so clearly demonstrated its superiority over all others of its kind. The patented Pivot Axle Seat Bar Lever Dodging Device can be obtained only on the Little Jap. It is the only cultivator perfectly adapted for either hillside or level ground use—among straight or crooked rows. A boy can operate it as easily as a man—weight of operator makes no difference.

The Little Jap is the easiest of all cultivators for the team to handle.

We furnish the Little Jap with all kinds of pin break and spring trip shovel gangs, surface gangs, spring tooth gangs and disc gangs. Prices from $21.25 up.



Sears, Roebuck and Co., Chicago

EVENTS OF THE WEEK.

DOMESTIC.—In the Massachusetts Senate April 10 the anti-vaccination bill was passed to be engrossed. This measure provides that any person who has reached the age at which attendance at school is permitted or required, and who presents a written statement from a parent or guardian, or by himself, if 21 years old, which declares that such parent or guardian or person is opposed to vaccination, shall not, as a condition precedent to admission to the public schools, be required to submit to vaccination, except at the time of a threatened or actual outbreak of smallpox, when the school board shall temporarily debar such person from the schools.

The Hotel Sagamore, at Bolton, on Lake George, one of the largest hotels in the Adirondacks, was destroyed by fire April 12; loss $250,000.

Fire destroyed three business buildings at Culpeper, Va., April 13, and caused the death of one person. Five firemen were also hurt. The fire loss is $65,000.

A three-alarm fire at 545 and 547 West Twenty-second street, New York, April 13, stubbornly resisted the efforts of the firemen, caused a $200,000 loss and tied up street-car traffic on three lines converging at the Twenty-third Street Ferry for more than an hour.

A ton of flour going from Nezperce to Pierce City, Idaho, by mail, passed through Lewiston, April 13, and although the flour is in 50-pound sacks it is necessary to weigh it every time it is transferred in order to get the weight for the mail contracts. A Spokane concern shipped 1,000 pounds of crackers to local dealers on the Camas Prairie, the rate being four cents a hundred pounds less than freight on that class of goods.

Upon the theory that while it might be safe to give the Rockefeller Institute of Animal Research the wide latitude provided by Senator Colgate's bill, which had passed the New Jersey Legislature, it would be unwise to confer this authority on irresponsible persons, Governor Fielder vetoed the measure April 13. The bill would permit the institute to establish a bureau near New Brunswick. John D. Rockefeller had endowed the institute to the extent of $1,000,000, and James J. Hill had given $50,000. The objections to the bill were numerous, but the principal one was by Frederick P. Bellamy, of Brooklyn, representing the Newark Vivisection Investigation League, who said the measure was so wide in its scope that it would permit the vivisection of human beings. Mr. Bellamy said the bill would give license to any one to practise any kind of vivisection, and any five persons wishing to incorporate might do any amount of experimenting.

Seven persons were killed April 14 in a fire in The Melvin, an apartment house at Commonwealth and Long avennes, Boston, and sixteen were injured. Fire started in the boiler room and spread rapidly up the waste and elevator shafts, filling the house with flames and smoke. The house contained twenty-one families. The damage was $100,000. Mayor Curley inspected the building, and said that the blame was due to "second-class construction."

Paul D. Cravath's Summer home, Veraton, at Locust Valley, L. I., was destroyed by fire April 14, although most of the furnishings, except those in the servants' hall, where the fire started, were saved. The loss is between $150,000 and $200,000. April 15 the Summer home of Mrs. P. F. Collier, at Southampton, L. I., was destroyed by fire, with a loss of $100,000.

FARM AND GARDEN.—Winter came back to the Texas Panhandle April 8 with a temperature of 10 degrees above zero. All the fruit in the vicinity of Dalhart, it is believed, has been killed. An inch of snow fell.

Vegetable and fruit crops in central Florida were damaged to the extent of many thousands of dollars April 9 by a hail and wind storm and a sharp drop in the temperature. Southern Florida escaped with a cold rain. Frost in the northern part of the State did not affect the crops, which are hardly matured. Bonfires and smudges were used.

The American Florist reports that by a jury decision in the district court at Fort Dodge, Iowa, April 1, a grower of seed corn is held responsible for its failure to germinate or produce a banner crop of corn. The case that thus goes on record was brought by Edward Hart, who bought seed corn of Robert Lawler, of Clare. The seed failed to germinate, a second planting was necessary, and was so late as to impair seriously Hart's crop results. The jury found Lawler's advertisement of tested seed corn an indirect guarantee of the seed and awarded Hart $250 damages. The case will be appealed.

The Postal Department at Washington, D. C., has been notified by the Department of Agriculture of the Dominion of Canada that the importation of nursery stock, shrubs, etc., through the mails will no longer be allowed. The announcement is as follows: "Under a regulation of the Department of Agriculture, which took effect the first of March, 1914, the importation into Canada of all nursery stock, including trees, shrubs, plants, vines, grafts, scions, cuttings or buds, through the mails, is prohibited, excepting greenhouse-grown florists' stocks, cut flowers, herbaceous perennials and bedding plants, provided that a detailed statement of the contents be attached to the parcels containing such matter."

The annual series of "onion specials" are now running from Texas to Chicago and other Eastern markets. The vegetable is being delivered in large quantities at Laredo, Tex., the center of an enormous traffic in onions. From Laredo special trains are sent to St. Louis, Kansas City and Chicago, from which points the Texas product is distributed North, West and East. Heavy shipments are made also from Laredo to Galveston and thence by water to New York, New Orleans and other ports.

The Senate Committee on Agriculture took formal action April 15 dissociating the educational work of the Department of Agriculture from the Rockefeller Foundation. By an amendment agreed to the Department is forbidden to accept any financial assistance from private sources or to prosecute any work with funds supplied from any source other than the Federal Treasury. The work in certain Southern States through the agency of the general education board of the Rockefeller Foundation will not be discontinued. The committee authorized necessary appropriations aggregating about $25,000 a year for continuing the work, in which more than 600 employees are engaged.

A women's agricultural conference will be held at the Pe- lvania School of Horticulture for Women, Ambler, Pa., May 16. This is the first conference held under the auspices of the Women's National Agricultural and Horticultural Association. Among the speakers are Mrs. Francis King, of Michigan, president of the association and vice-president of the National Flower Club; George T. Powell, W. P. Hartman, Chief of the Bureau of Information and Markets of the Grange. The conference is to cover many subjects, such as agricultural education for women, hardy flowers, foreign food plants, fruit, poultry, vegetables, paeonies and Iris, aquatic plants, violet culture, canning and preserving, etc.

The record price for a New York fruit farm was recently paid in Yates County. The report is that Timothy Costello sold 55 acres of land just outside of Penn Yan for $60,000. This property carries an apple orchard of 50 acres, and it was bought by Glenn L. Wheeler. We understand that Mr. Costello bought the place nine years ago for about $11,000, and has since added about $5,000 in improvements. The apple orchard is a noted one, and known all over Western New York. All through the Lake section apple land has gone to a high figure when the orchards are of good varieties and properly handled. The increased value of fruit land in that section is not built upon boom prices, but represents a steady development in the earning capacity of the orchards. Probably nowhere else on earth has the fruit business developed so solidly and securely as in Western New York, and the high values for good apple orchards are legitimate, since they are based upon actual business and production.

The Dutchess County Coöperative Association was organized at the courthouse in Poughkeepsie on April 10. Charles C. Mitchell, of Millbrook, was elected president; Mr. Dickerson, vice-president; Mr. Hasbrouck, financial secretary; Mr. Lacy, corresponding secretary, and Mr. Hogan, treasurer. Strictly coöperative by-laws were adopted, and the organization is in line for associating itself with the new Food and Market Commission when this is organized, and also with provisions to secure for its members the benefit of the new Land Bank law.

OHIO CROPS.

The Ohio Agricultural Department makes the following report of crops for the State, April 1:

Wheat—Condition compared with average, 95%; condition reported one year ago, 93%; crop of 1913 still in producer's hands, 14%, approximately, 3,500,000 bushels.

Winter Barley—Condition compared with average, 96%; condition reported one year ago, 88%.

Rye—Condition compared with average, 96%; condition reported one year ago, 94%.

Corn—Condition in crib, compared with average, 93%; condition reported one year ago, 94%; remained on husk in field, 5%; damage to unhusked during Winter, 14%; damage to fodder during Winter, 23%.

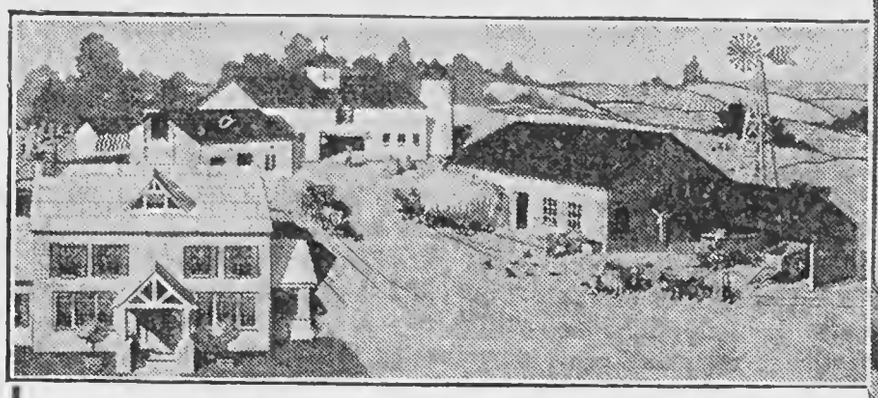
Fruit—Prospect compared with normal yield, 83%; reported one year ago, 89%; buds, Winter-killed, 26%; reported one year ago 7%.

	1913	1914
Wheat	$1.01	$0.93
Corn	.53	.68
Barley	.64	.64
Oats	.36	.43
Rye	.74	.71
Potatoes	.57	.89
Hay	10.78	12.61

I have 40 per cent. live buds left on Elberta peach trees, and 30 per cent. on Mountain Rose and Oldmixon, which is twice as many as are needed to make a full crop. Mr. Barnes, of Barnes Bros., one of the largest growers in Wallingford, tells me there are enough remaining generally in that town to make a good crop. Wallingford and vicinity is the largest peach growing district in New England. Massachusetts and the northern part of Connecticut have lost probably all, or nearly all, the buds. N. S. P.

New Haven, Conn.

The Second Great J-M Roofing Achievement



One of the principal contributions to roofing progress as developed by the H. W. Johns-Manville Company, is

J-M REGAL ROOFING

"The Roofing with Life"

THIS material was perfected to supply a demand for a rubber type wool felt roofing, lower in price than J-M ASBESTOS, but containing the Johns-Manville standard of quality and service.

J-M REGAL ROOFING does not dry out in the hottest climate and will not freeze or crack in the coldest weather. Does not melt, harden, rot or crumble with time; remains pliable and retains its water-and-fire-resisting properties indefinitely.

Made of the highest grade wool felt, thoroughly saturated and heavily coated on both sides with genuine Trinidad Lake Asphalt, the most durable water-proofing substance known to roofing science.

Every roll supplied with J-M CLEATS, making it easy to lay, insuring absolutely water-tight joints, and lending a very attractive appearance to any roof because it does away with unsightly cement-smeared edges and laps.

J-M ASBESTOS ROOFING and J-M ASBESTOS SHINGLES are the only other roofings, beyond J-M REGAL, you ever need consider. They cover your house and building with stone—defying fire and weather and time forever.

SAFETY FIRST

More is expected of a Goodrich Tire than of any other—and more is given by it

The obligations placed upon any automobile tire are largely in direct proportion to its acknowledged rank.

Goodrich Safety Tread Tires

Made to fit all types of rims—live up to their reputation

They represent the highest development of sound, sensible tire principles—are efficient, complete and well balanced tires—along with the quality principle of service.

There is no sound reason why you should pay more for any tires than the Goodrich schedule:

Size	Smooth Tread Prices	Safety Tread Prices	Grey Inner Tube Prices
30 x 3	$11.70	$12.65	$2.80
30 x 3½	15.75	17.00	3.50
32 x 3½	16.75	18.10	3.70
33 x 4	23.55	25.25	4.75
34 x 4	24.35	26.05	4.90
34 x 4½	33.00	35.00	6.15
35 x 4½	34.00	36.05	6.30
36 x 4½	35.00	37.10	6.45
37 x 5	41.95	44.45	7.70
38 x 5½	54.00	57.30	8.35

The tread that makes the brake effective

THE STRIPED TREE CRICKET.

Will you tell me what kind of insect or bug deposits eggs in a slit cut into the bark of the shoots of a young apple tree? I have found a number of these deposits on my trees. The slit is usually about an inch long and contains about 25 eggs.
Massachusetts. D. A. R.

The group of insects to which the grasshoppers, katydids, and crickets belong contains many species that are more or less injurious, and a few species that have constituted the greatest insect scourges man has ever known. We refer to the different kinds of locusts, especially the Rocky Mountain locust. Perhaps some who read these lines can recall from their own experience the great hordes of these locusts that swept over some of the Western States in the seventies, and literally ate every green

WORK OF TREE-CRICKET. Fig. 251.

thing in their path. Fortunately, the tree-crickets have never proven to be so injurious.

The tree-crickets are fragile in appearance and the wings are pale in color, almost white in one species, so that it is called the snowy tree-cricket. The tree-crickets are wonderful songsters. The song is heard mostly at night, although some of the singers may be heard on cloudy days. The singing begins as soon as the dusk appears, and continues during the whole night. The song seems to come from everywhere, and fills the air with a volume of shrill monotonous sound. The insects are remarkable for singing in unison, so that the songs of the different individuals constitute an insect chorus. The singers may be found among the branches of trees or shrubs, or even among tall grasses. The song of the snowy tree-cricket sounds like the word, *treat, treat, treat*, slowly and shrilly uttered without variation the whole night through. This is probably the most common insect song heard during Summer nights.

Although the tree-crickets are fragile looking, yet the female is provided with a stout ovipositor, with which she can bore holes in the stems of plants in which to deposit her eggs. The striped tree-cricket (Oecanthus nigricornis) drills several holes in a row in the stems and deposits a long white egg in each hole. Wherever she deposits these eggs she leaves a long narrow scar in the bark, like that shown in Fig. 251. In these scars there may be 20 to 30 eggs which are deposited in the Fall. The striped tree-cricket deposits her eggs preferably in the canes of raspberries and blackberries, and sometimes in the twigs of peach, currant, cherry, and now we find them in the apple, for the egg scars in the apple twigs referred to in the foregoing letter are made by this tree-cricket. This insect is sometimes quite destructive among raspberries, because the terminal shoots are destroyed by being broken off at the scar. The only feasible way of controlling this tree-cricket is to cut off and burn the infested twigs before the eggs hatch.

GLENN W. HERRICK.

STRAWBERRIES AND CORN.

Tell me what you think of a "fool trick" I am going to try this Spring. I had a piece of good grass, a section between two rows of trees, and in the adjoining section I have a nice strawberry patch one year old last Fall, which is in fine condition now. Last Fall quite early I plowed up the grass land, turning in a good heavy dressing of stable manure, with a flock of about 60 or 70 Buff Wyandotte hens following the plow and helping themselves to all the June bugs they could find. It was afterwards wheel-harrowed, the hens again having a picnic following it, and then drag-harrowed once or twice more under the same conditions. I think the grub question will be settled, and now I intend to plant it to Golden Bantam corn and set a strawberry bed in the rows, cultivating them as I cultivate the corn. The plants I can get easily from my old bed, which is right alongside of it, and I can work a half hour at a time whenever I can get a chance at taking up and transplanting them. The corn rows will be 3½ feet apart and the hills two feet apart, and I shall set a strawberry plant between each hill and keep them in hills the first year. After the corn is off I shall pull the stalks, which I always do, as I keep no cow, and either pack them around my apple trees for a mulch or use them to mulch the strawberry plants through the Winter, and then next Spring fork them off and put them around the trees. I like corn fodder to mulch strawberries about as well as anything I have ever used, as it is free from weed seed, does not pack down hard upon the plants, and is easily removed in the Spring. One year I had a large bed mulched with it and in the Spring took it off and packed it around an apple tree that had never had a fair crop of apples, but the following year, with no fertilizer of any kind I gathered nearly 40 bushels of apples. I shall spray three times this year, including one spraying with lime sulphur. Will you tell me what the following combination figures out in ammonia, phosphoric acid and potash, and what you would think of its use in my orchard which is sandy loam mostly? I think of mixing in equal parts by weight of nitrate of soda, muriate of potash, fine ground bone, acid phosphate, and tankage. Z. C. B.
Connecticut.

If the grubs have been killed out this plan is practical—in fact it is quite frequently done. We are not sure that this soil will be found free from grubs, in which case the plants will suffer. We should start the strawberry plants as early as possible. The Bantam corn makes a short stalk, and will not seriously interfere with the plants if the stalks are taken out at once after the ears have been picked. Then give the plants the best possible culture. We have seen some remarkable things done with corn and strawberries. In one case an old strawberry bed was picked and then at once plowed and fitted. Crosby corn was planted in rows three feet apart. This made a rapid growth, and early in August large layer or potted plants were set on straight lines down the middles of the corn rows. Both crops were hand hoed and the cornstalks cut as soon as the ears were fit, when horse culture was started. It was a wet season, and the plants made a good Fall growth and gave a fair crop the following year.

If the chemicals mentioned are of good quality the mixture should represent the following:

POUNDS IN TON.

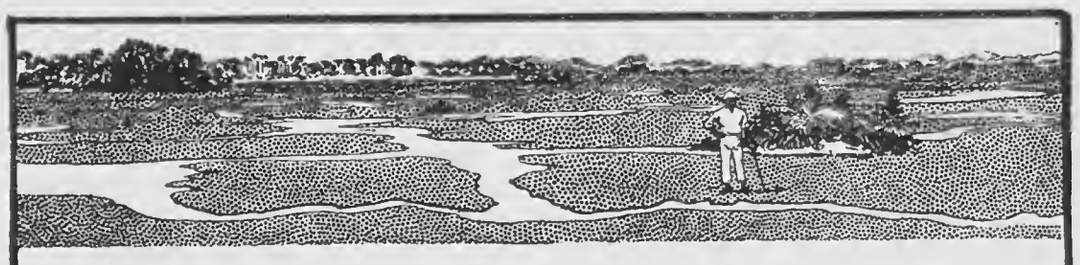
	Nitrogen	Phos. Acid	Potash
400 lbs. Nitrate of Soda	64	...	...
400 lbs. Fine Bone	12	100	...
400 lbs. Muriate of Potash	..	...	200
400 lbs. Acid Phosphate	..	64	...
400 lbs. Tankage	28	40	...
2000	104	204	200

This means 5.2% nitrogen, 10.2% phosphoric and 10% potash—a good mixture for garden crops.

MAGISTRATE (to prisoner, who has been before him every month for years).: "Ebenezer Noakes, aren't you ashamed to be seen here so often?" "Bless yer 'eart, sir, this place is quite respectable ter some places where I'm seen."—Melbourne Leader.

JONES met his neighbor Smith, who carried a gun in his hand. "Been shooting this morning?" asked Jones. "Yes, I had to kill my dog," answered Smith. "Why, was he mad?" asked Jones. "Well," said Smith, dryly, "he didn't seem to be any too well pleased."—National Monthly.

HOLDING a glass of clear honey in his right hand, father observed impressively: "It cost the little bees many a weary trip to fill this with sweetness from the flowers." Little Laura, who had been listening closely, exclaimed with great earnestness: "Wouldn't it have been too bad if one of them had dropped the glass?"—Judge.



Natural asphalt is the life of roofing

And roofing *must have* life to withstand the weather.
The natural oils in Trinidad Lake asphalt keep it full of life and resisting power.

Genasco
THE TRINIDAD-LAKE-ASPHALT
Ready Roofing

is made of this everlasting waterproofer of Nature. It is watertight and weatherproof.

Because Genasco is sealed with this genuine *natural* asphalt, it doesn't crack, rot, break, or leak.

Ask your dealer for Genasco. Look for the hemisphere trademark. The KANT-LEAK KLEET makes seams watertight without cement and prevents nail-leaks. Write us for the Good Roof Guide Book and samples, free.

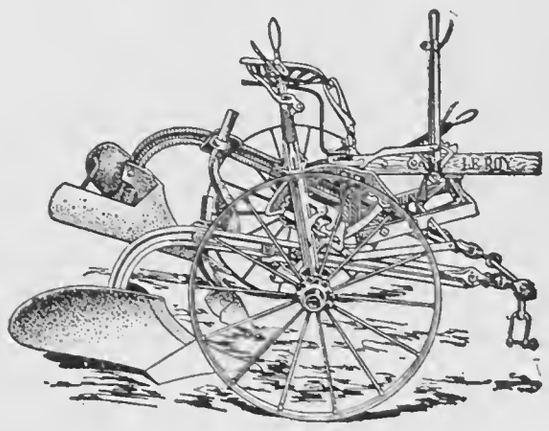
What One Farmer Did With a Light Draft Le Roy Reversible Sulky Plow. Why Not You?

Le Roy Plow Co.,
Le Roy, N. Y.

Gentlemen:—The two-way Reversible Sulky Plow I purchased from you last spring has turned out to be a most profitable investment and the best tool I have on the farm.

I figure the plow has paid for itself already just through the extra cost of fitting up the dead furrows had I used a one way plow.

It plowed 25 acres of stubble for beans, 20 acres of hard stony ground for wheat, 20 acres of old sod which had not been plowed for years, giving no trouble at all and without buying a single extra point. The points that came with the plow were not changed for the entire distance.



MANUFACTURED BY
The Le Roy Plow Co.
LeRoy, N. Y., U. S. A.

The other parts of the plow are as good as new. My boy did most of the plowing and came in at night just as fresh as he went out in the morning.

It is also easy on the horses for I never have to rest them. I figure it saved 455 miles of walking. I hope you sell a lot of them. Yours truly,
Fort Hill, N. Y., Dec. 12, 1913. John H. Parmelee.

The Le Roy handles just as easily in small fields as large and will turn the same sized furrow as any other with much less horse power.

Every farmer likes the **LIGHT DRAFT LE ROY**, because it works so easily, does such good work in a large variety of soil, is easy on the horses, pays for itself so quickly and saves walking 7 miles to the acre.

The Le Roy is guaranteed to do better work than any other reversible sulky plow made. Ask your dealer for a trial or write us.

We are not in a Trust or Combine, but are a strong Independent Company.

LE ROY PLOW CO., LE ROY, N. Y.

Hope Farm Notes

THE GARDEN.

Every year at or before this time the garden question becomes a living issue. It is far more important to us than the tariff, the Mexican question or Mr. Bryan's management of the State Department. Villa may be Mexico's president and he may try to annex the United States or Mr. Bryan may send a case of grape juice to King George, and still Hope Farm would move on. If, however, we were not able to go out at any time during the Summer and pick a dozen or more different vegetables there would be a social earthquake here. Properly so, because from Redhead up to Baldhead our folks have been trained to know that it is the duty of a piece of land to provide 60 per cent. of the family food through a good garden. These men who claim that it is cheaper to buy vegetables, or who are willing to live on meat, eggs and potatoes all Summer long will get no followers here. There is no law to prevent their prohibition of a good garden except the law of common sense, and who can enforce that?

A garden will cost some money and more work, but it is worth it all. You cannot spend a dollar to better advantage, and no hoe can scratch up more gold than a garden hoe. This season is late, and there is still ample time for some of these non-gardeners to make their start. Most of the wise ones have bought their seeds, but still we have people come asking for an outfit that will provide a full supply for an average-sized family. I could tell what we buy, or I could get other individuals to give their choice, but I find that gardeners vary in this as they do in other things. When you find the Leghorn hen man admitting the claims of his R. I. Red neighbor, or the Airedale dog man claiming that the bull dog has anything on *his* friend in fur you may expect two garden cranks to argue on seeds. To the man without much experience advice based on wide knowledge is better, for such advice is sure to cover observation of many different soils and localities.. If I wanted to know what varieties of strawberries would be likely to do well in a certain section I would go to a man like W. F. Allen, who sends plants everywhere and knows from reports how the varieties behave. So in order to get a fair idea of best seeds for an average garden I went to W. Atlee Burpee. The following list is based upon personal experience and also upon distribution, for critical buyers will discard the unsuitable and continue to try what satisfies them.

The following list has been compiled with a view of furnishing a family of six people with vegetables throughout the season:

150 feet peas, Prolific Extra Early, one quart.
75 feet peas, Pioneer, one pint.
75 feet peas, Stratagem, one pint.
40 feet onion sets, one quart.
100 feet onion, Southport Yellow Globe, one ounce.
75 feet beet, Black Red Ball, Detroit Dark Red, one ounce each.
50 feet lettuce, May King, Big Boston and Iceberg, one packet each.
30 feet spinach, Long Season, one ounce.
75 feet parsnip, Offenham Market, one ounce.
50 feet carrot, Early Short Scarlet, Danvers and Saint Valery, one packet each.
30 feet turnip, Early Milan and Red-Top White, one packet each.
200 feet sweet corn, Golden Bantam, Howling Mob, White Evergreen and Country Gentleman, one packet each.
100 feet string beans, Burpee's Stringless Green Pod, Burpee's Stringless White Wax, one pint each.
100 feet beans, dwarf Lima, Burpee Improved, Fordhook Bush, one pint each.
12 hills cucumber, Fordhook Famous, one packet.
15 hills watermelon, Fordhook Early, one packet.
15 hills muskmelon, New Fordhook, one packet.
6 hills Summer squash, Mammoth White Bush, one packet.
6 hills Winter squash, Hubbard, one packet.
6 hills pumpkin, Golden Oblong, one packet.

Two to four ounces of radish, Scarlet Button, Rapid White and White Icicle to be sown in the rows with other crops such as lettuce, as they will be used ere they would interfere with the maturing of the other crops.

Celery and late cabbage may be planted after early peas, string beans, etc., and room must be left for at least 50 tomato plants, or if it is preferred to raise these from seed, sow one packet each, Chalk's Early Jewel and Burpee's Matchless.

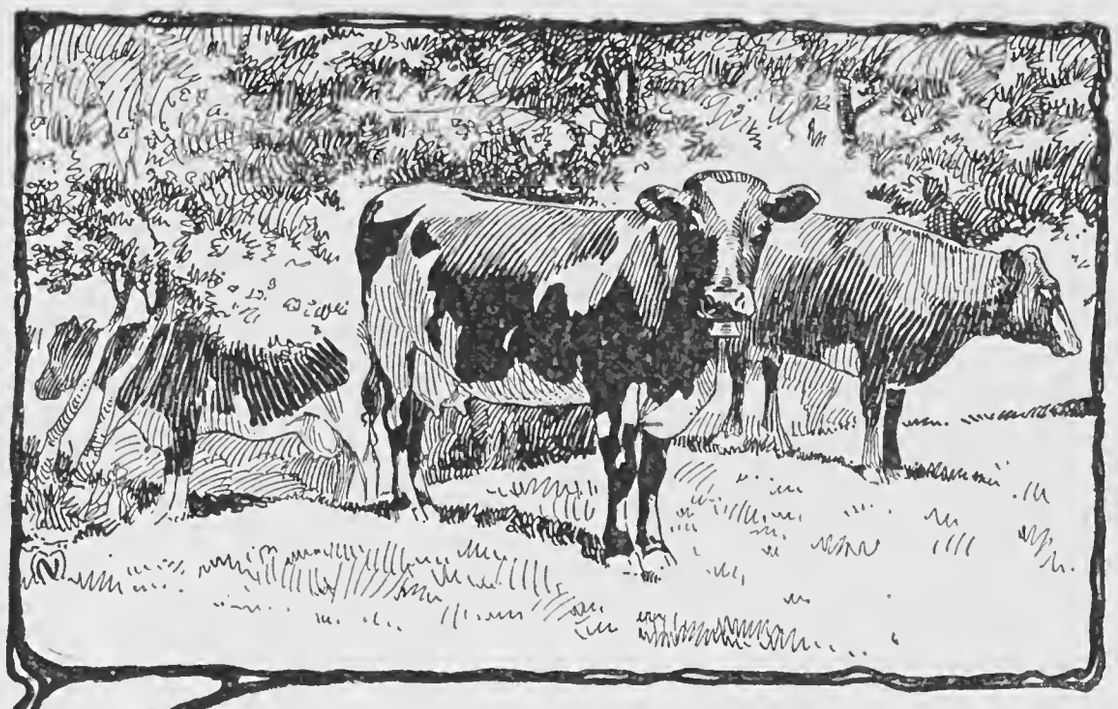
Mr. Burpee also likes Blue Bantam and British Wonder peas. He would add a rutabaga turnip and substitute Wayahead for May Queen lettuce and add Deacon. Extra Early is a good cucumber. Rapid Red is preferred to Scarlet Button radish. There are many who prefer Emerald Gem or Spicy to other melons.

HENS.—The Hope Farm representatives at the laying contest are still working away. They manufacture eggs on the whole better than I expected. I shall soon give their record, and financial standing up to date. We had them "scored" by an expert poultry judge to see how they would stand at a poultry show. You remember that seven of these birds were bought in the New York live poultry market—just as they came from Southern poultry dealers. The other three are of known parentage. When you see the scores you will know what we got. At home we have a flock of mongrels, a small pen of Leghorns and a bunch of R. I. Reds which I bought in Northern Vermont, expecting to compare these northern-grown birds with another lot from the Gulf coast. These Reds are good ones—not show-ring birds but strong, healthy hens and good performers. I want to breed the best of them to a cockerel of known pedigree. We have one in mind—son of a trap-nested hen of over 200-egg record, and sired by the son of another trap-nested hen of known pedigree. Following what we know about breeding cattle I think the use of such pedigreed birds on our best hens is the way for hen men to "breed up." If I can get some good pullets from this cross I will enter them in the next contest. We have another pen of "runt" Leghorns. You may remember that last Fall I got hold of a pen of small stunted birds. They were out of a large flock of finely bred Leghorns, but in some way they failed to grow in spite of the best care and feeding. The usual plan is to kill these runts, but I wanted to see if they would lay or breed, and if they did whether their chicks would come back to normal size. Most poultrymen thought they would not lay, but they started in March and are doing fairly. We have some of their eggs under good hens and I hope to show that chicks from these runts will "come back" and make good-sized birds.

"SLICKING UP."—We are trying our hand at a little landscape gardening this year. From time to time we have added to the lawn space around the house, but not much has been done at planting trees and shrubs. When we came to consider it seriously we found that some expert advice was needed in order to do it right. Fixing up the home grounds is something like making a dress—you have got to know how the separate pieces are to fit in and make contrasts before you start. Any man can dig holes and put in little trees or shrubs, but he ought to know before he starts them how they will look when they grow up. This is what we call vision or understanding. The possession of it separates the expert from the ordinary workman. Some people never can get it in any way. When it came to planning the future of our home grounds I confess that I could not tell how to group things for best effect. When one must make such a confession he is wise to leave the job to some one who knows. Mother knew about what she wanted, but did not understand the details, so we got expert advice. It is remarkable how these men who know can run their eye over a place and see how it will look years ahead when their plans mature. As this thing of making the home grounds attractive is coming to be more and more important I will try to tell how we do it—step by step as the work is planned. No one should tell me that such work does not pay. In the East at least now that roads are improving and travel is increasing a well-kept, neat lawn is a standing advertisement for the farm and the farmer.

H. W. C.

"HAVE you lived here all your life?" asked a traveller of a cadaverous rustic, who stood idly leaning against a fence. The rustic shifted his weight from one foot to the other. "Not yet!" he replied. —Melbourne Leader.



Pick out your California Farm this Spring

Look into the money-making possibilities of dairying, poultry-raising and fruit-growing in the San Joaquin Valley—heart of Golden California—now. This year will see thousands of homeseekers in California. **Your** foresight should lead you to anticipate this influx.

Here is a wonderfully fertile valley whose deep, rich soil, all-the-year-'round growing climate and irrigation facilities make it a food factory that produces a great range of crops in bountiful measure. Its location gives it ready access to markets eager for all that can be produced.

It is already a well-developed country. People here get together and coöperate to save and to make money for each other.

I am here to help you to locate to advantage. I am not selling land—but I can point out the land best adapted to various crops. I can save you time and travel. I want to secure ambitious, progressive farmers to cultivate these prolific acres along the Santa Fe.

Write for our free books, "San Joaquin Valley," "Dairying" and "Poultry." Read what they tell of the **reasons why** this country is good—of people who have made successes, and how—of results which **you** can get if you have only the necessary energy and ambition.

I would like you to read what the farmers already here have to say in regard to what has been done by them to win fortune in this land of big returns.

Send coupon, or your name and address on a postal, saying "San Joaquin Valley." This will bring the books promptly and any additional information desired. Write today.

C. L. Seagraves, Genl. Colonization Agent,
A. T. & S. F. Ry., 2209 Railway Exchange,
Chicago:

Please send me free copies of your three books on farming in the San Joaquin Valley, California.

LOCAL FARMERS List with us, WHY? Because they know we advertise truthfully and extensively, COMMAND the respect of our Banks and Merchants, and look after their interests as well as those of the buyer. Our bargains are bargains. Seeing is believing.
FARMERS REALTY CO.
Quakertown, Pennsylvania

Stock and Tools Included—105 acres, 15-room house, two barns, main one 40x60; basement; silo; fruit; 2 miles Railroad town; 7 cows; 5 horses; 50 hens; binder; plows; harrows; mower; rake; heavy wagons; buggies; sleighs; numerous other things, all for $4,000; $2,500 cash; balance, three and five years. Lady owns it must go. Catalog No. 102. HALL'S FARM AGENCY, Owego, Tioga Co., N. Y.

THE BEST FARM IN NEW JERSEY at $10,000, I honestly believe, is one of 136 acres just out of Washington; near trolley. House of 9 rooms, bath, furnace; excellent outbuildings, with slate roofs. Land slopes south-east; 127 acres cultivable. E. E. SLOCUM, 141 Broadway, N. Y. City

150 FARMS FOR SALE—Near Phila. and Trenton markets; good R.R. and trolley facilities. New catalogue. Established 25 years. HORACE G. REEDER, Nowtown, Pa.

VIRGINIA FERTILE FARMS $15.00 ACRE & UP.
The most profitable farming in America is in the mild, healthy climate of Virginia. Yearly rainfall 45 inches. Alfalfa 4 to 6 tons acre, Corn 50 to 100 bu. acre. Specially adapted for cattle and hogs. Write for official list and literature.
F. H. LA BAUME, Agrl. Agt., N. & W. Ry., Room 265 N. & W. Bldg., Roanoke, Va.
N&W RY.

A FARMER'S GARDEN
Helps his wife to plan her table in busy times. Saves work and worry, saves buying so much meat, gives better satisfaction to the help. A good garden will be almost impossible in your busy life without proper tools. They cost little and save much hard work.

IRON AGE WHEEL HOES AND DRILLS
will sow, cultivate, ridge, furrow, etc., better than you can with old-fashioned tools and ten times quicker. A woman, boy or girl can do it. Can plant closer and work these hand tools while the horses rest. 38 combinations from which to choose at $2.50 to $12. One combined tool will do all of the work. Ask your dealer to show them and write us for booklet, "Gardening With Modern Tools" and "Iron Age Farm and Garden News" both free.

BATEMAN M'F'G CO.
Box 102B
Grenloch, N. J.

WANTED—Responsible party to take charge of our business in each county handling sale of Automatic Combination Tool, a combined wire fence stretcher, post puller, lifting jack, etc. Lifts or pulls 3 tons, weighs 24 pounds. Sells readily to farmers, shops, contractors, etc. No experience necessary. Descriptive catalogue, prices and terms free upon request. HARRAH MFG. CO., Drawer O, Bloomfield, Indiana

HEADQUARTERS For New York "FARMS WORTH FARMING" Why? See Our Bulletin State Your Exact Needs
GARFIELD REAL ESTATE CO
2 GARFIELD BLDG. ROCHESTER, N.Y.

FERTILE FARMS—Beautiful Perkiomen Valley, excellent markets. Catalog. W. M. Stevens, Perkasie, Pa.

Not Something For Nothing...

but *something* in exchange for a little work securing new or renewal subscriptions to The Rural New-Yorker. A post card addressed to Department "M," The Rural New-Yorker, 333 West 30th Street, New York City, will bring you the details. Better send today.

Ruralisms

THE CHINESE WILD PEACH.

The illustration below is reproduced from Bulletin No. 91, issued by the Office of Foreign Seed and Plant Introduction. F. N. Meyer, botanical explorer for the Department of Agriculture, who sends this picture, says of the variety, botanically Amygdalus Davidiana:

A very vigorously growing form of the wild peach found in the well-trampled courtyard of a Chinese inn at Peking. It is said to be a hybrid. The trunk, five feet above the ground, measures 5 feet 6 inches in circumference. The Chinese name is "Mau tau shu," meaning "Hairy peach tree." This very vigorous growth under decidedly adverse conditions shows the resistance of the species, and indicates a wider range of usefulness for stock purposes than had been suspected.

Mr. Meyer has sent the Department 1,500 pounds of these peach stones, with this comment:

As there is a great deal of variation among these seeds, they may be graded according to size, the larger ones to be used as stocks for vigorously growing stone fruits, like peaches, apricots, certain plums, etc., while the smaller ones may be used as stocks for small or slow-growing stone fruits, such as bush-cherries, sand-cherries, dwarf plums, almonds, etc. A goodly portion of these seeds should also be devoted to testing against various diseases our stone fruits are suffering from, with the object of finding whether they will be less susceptible to such diseases when grafted on this remarkably healthy wild peach.

CHINESE WILD PEACH TREE IN COURTYARD AT PEKING.

Chinese Grafted Chrysanthemums.

Bulletin 92 of the Office of Foreign Seed and Plant Introduction reports on a species of Artemisia (wormwood) from Peking, China, which is thus described:

A biennial wormwood, occurring as a weed on all sorts of dry, waste places. The Chinese utilize this plant as a stock to graft Chrysanthemums upon, and claim that "mums" thus grafted are earlier, need less water and no manure, are more easily lifted and transplanted, and in general require far less care than when on their own roots. To obtain the best results the Chinese sow the seed in late Summer, in well-drained beds. The seeds germinate quickly, but the little plants make but very small growth during the Autumn and Winter. When Spring is there, however, they develop with great vigor, and in June they have well-formed stems. Now the Chinese cut off the main stem an inch or so from the ground and graft a Chrysanthemum scion upon it by the ordinary cleft-graft method; no wax is used, but only a small strip of fiber, while the plants are shaded during the first days. The stock and the scion soon unite and continue to grow vigorously. On very strongly developed specimens of stock the main branches are often used to insert on every one a different variety of Chrysanthemum or to train a beautiful "standard" tree of it, and some of such specimens are fully as good as the plants seen at home exhibitions of "mums." The above described method of grafting Chrysanthemums might prove to be valuable for the sections of the United States where the Summers are somewhat too short or the nights too cool to rear the plants successfully out of doors, as, for instance, in the more elevated parts of the Rocky Mountain States. Care has to be taken in watering the plants sparingly when lifted and planted in flower pots.

Suggestions About Shrubs.

Can you print suggestions on the culture and care of shrubs in general, which will be helpful to their best development in the hands of an amateur? Is there any book on shrubs, or do most shrubs take care of themselves when finally established? Can a person produce more flowers by any system of feeding?

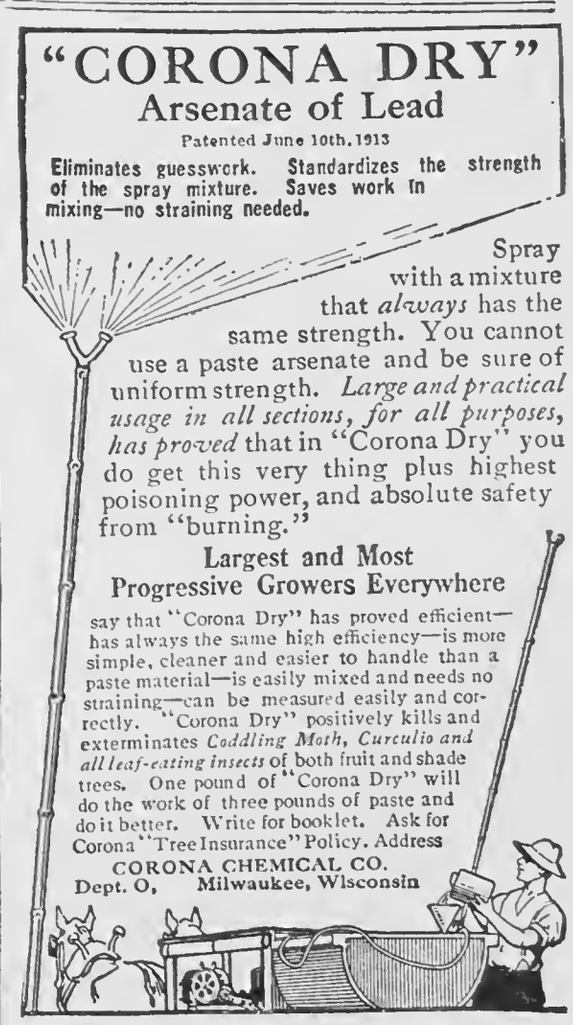
Boston, Mass. G. A. B.

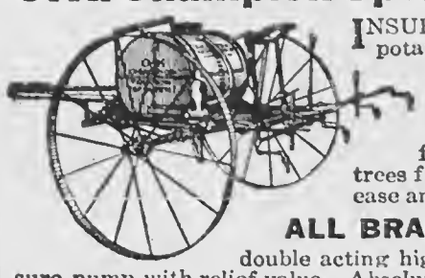
The two points that have most to do with the beauty and thrift of shrubs are planting and pruning. The ground should be prepared for them in advance, giving it as good culture as a cornfield, or, in the case of a single shrub, digging a hole that will insure good drainage, and filling with well pulverized soil. Unfermented manure or fertilizers should never come in contact with the roots of shrubs or trees. As the roots receive some injury when the shrub is lifted, the top should be cut back in proportion when it is set. Plant with care, working fine soil well in among the roots, firm the soil well, and then leave the top two or three inches loose for a mulch. A light mulch of old manure or other litter is an advantage, especially with conifers, but a heavy mulch is undesirable, as it is likely to cause roots to start too near the surface. A mulch of well-rotted manure spread around shrubs in the Fall, the remains lightly raked into the soil in Spring, is usually all the fertilizing needed, unless in a very sterile place.

A general rule for pruning shrubs is that early Spring bloomers be trimmed as soon as flowering is over, while those that bloom later should be pruned in Fall or late Winter. We often see Forsythias and early Spiræas neatly trimmed in Spring, the result being that most of the flowering wood is cut away. The flower-buds on early-blooming shrubs are formed the year before; those flowering in Summer or Autumn bloom on the current year's wood, hence the distinction.

A useful book, giving much information about shrubs and outdoor planting in general is "Landscape Gardening as Applied to Home Decoration," by S. T. Maynard; price $1.50.

SYLVIA, supple and slender, and Aunt Belle, bulky and benign, had returned from a shopping tour. Each had been trying to buy a ready-made suit. When they returned home, Sylvia was asked what success each had in her efforts to be fitted. "Well," said Sylvia, "I got along pretty well, but Aunt Belle is getting so fat that about all she can get, ready-made, is an umbrella."—Youth's Companion.





The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

The Rural New-Yorker has, at its command, the largest and most efficient corps of correspondents and advisers ever gathered by any farm paper in the world. Thus we can obtain for you the last word on any subject relating to the soil, its cultivation or its products, or the human life of the farm. This service is yours for the asking.

*

DOES it pay to buy the so-called "natural" potash, limes or marls? These limes are usually offered with a guarantee of about 50 per cent lime and small quantities of potash and phosphoric acid. We should figure the price. Usually, a plain lime with potash and phosphoric acid bought separately in chemicals will prove a better bargain. In one case a farmer was about to pay $9 per ton for one of these fancy-named limes when he found he could buy a good crushed limestone for $2.50. "What's in a name?" Certainly not $6.50 a ton.

*

ANOTHER agricultural "contest" is suggested by A. C. Baer of the Wisconsin Agricultural College:

While our great national exhibitions of dairy products are all very well in their way, there is perhaps nothing that will stimulate the local dairymen and gain public appreciation like a milk-scoring contest held in the home town, where the producer, dealer and consumer can meet with common interests and mutual good feeling.

As we understand it, this means a contest to show which producer or dealer furnishes the best milk. A "score" could be arranged so as to include sensible points of cleanliness, freedom from disease and filth, and quality, with producers, consumers and doctors to act as judges. It would interest the public, increase the sale of good milk and make a better understanding between dairymen and consumers. It would, of course, mean a great advertisement for the dairymen who scored high, and it might be said that this would favor the wealthy class, who can afford every sanitary appliance. We think, however, that it would reveal men in rather humble circumstances who through natural neatness furnish the finest of milk.

*

THE average woman has more sentiment and vision than her husband or father. That is as it should be, for the man's place is to provide the home—the woman's to make it. Coöperation is to be the great social development of the future. Left to the men alone, true coöperation would be a long time coming, for the masculine mind must get rid of many prejudices and ideas of individuality before he can coöperate truly. In every country community you will find that organizations of women are more enduring and usually more helpful than those of men. It is not strong power or money or love of gain which can hold a coöperative society together. It is rather sentiment or ideals which act like the clinging mortar to hold the bricks or stones together. In our country neighborhoods the influence of women will be greatly needed to make true coöperation a success. In fact, it can hardly be brought about without just such help. It is of great importance that women study this mighty question which, within five years, is to present the greatest national problem. We expect to give a number of articles from women who have been leaders in coöperative work.

ON page 618 will be found a map, showing where the regional banks are to be located under the new currency law. This law was fully explained in THE R. N.-Y. just after the bill was signed by the President. For a few days after these locations were announced the daily papers were bitter in their criticisms, declaring that several financial centers had been neglected. This criticism is now dying out. We think the banks were located not so much where the bankers wanted them as where they could best serve the people. It would be impossible to please everyone. If more banks are needed to cover business properly Congress can create them later.

*

MR. PARSIL'S articles on home canning represent the real thing. This is the true principle of farm management. So long as market prices for tomatoes and other truck are high enough to give a profit over labor, it will not pay to put the produce into cans. When the glut comes, and the produce must be wasted or sold at a loss, the cans come in as a friend of labor. It is something on the plan of Joseph putting the surplus of the fat years into storage to provide for the coming lean years. The lean garden months are in Winter, and then the home-filled cans find their sale. There are fair possibilities in this home canning—no great fortune, but a good chance to turn waste into profit. That is about all there is left in manufacturing to-day—turning waste into profit.

*

THERE is no corner of the country into which THE R. N.-Y. does not go. Here is a letter just at hand:

I got some seeds from —— ——, and he had the seeds wrapped in some papers, and the papers were named THE RURAL NEW-YORKER. I read some of the leaves, and I found some good reading on them, so I wish I could get a copy to see what the real paper is. Would you send me a copy, and also the price of the paper for one year? C. E. W.
Pennsylvania.

The seedsman here mentioned belongs to the brilliant ink, blowhard class—one of the last men you would expect to act as agent for THE R. N.-Y. We met an Alabama reader who said he found his first copy wrapped around a stone in the middle of a bale of Michigan hay! A Nebraska woman found a few torn pages in a package of nursery stock. She has subscribed in order to read the remainder of an article which interested her. An American, who had lived many years on the island of Java, found a torn copy of the paper. *"Father used to take it,"* he wrote when he sent his subscription. He said he had told his Indian wife about the maple syrup and buckwheat cakes he used to eat in Vermont years before, and he wanted to prove some of his statements. So we bought him two gallons of syrup and some buckwheat flour, and in due time, after a long journey, they brought a taste of old Vermont to "India's coral strand." We firmly believe that there is no paper in the country more widely distributed among American country homes, or more thoroughly read therein than THE R. N.-Y.

*

AN unwelcome guest at the banquet this year will be our old friend, Musca domestica, the common house-fly. This filthy and dangerous pest is a nuisance and a disease carrier—an enemy of society, to be killed at sight. During the Summer this rascal is capable of passing through 12 or more generations in one season. One individual fly lays about 120 eggs, which hatch better than the eggs in a hen's stolen nest. This shows the folly of trying to abate this terrible nuisance by killing these flies off one by one. We should begin a campaign early—right at the fountain head. This fly breeds from choice in horse manure, rarely selecting other forms of filth. If the horse manure can be kept out of reach of the flies, or treated so as to destroy the eggs, the fly nuisance will not be serious. Where only one or two horses are kept it may be promptly thrown into a room or shed with screened doors or windows, where the flies cannot reach it. Where there are more horses the manure can be hauled away frequently and plowed under, or piled at some distance from the buildings. Another precaution is to sprinkle chemicals over the fresh manure. Equal parts of acid phosphate and kainit make a good mixture for this. About two pounds per day for each horse will repel the flies or destroy their eggs, and make a great difference in the numbers which swarm around the house. This nasty insect may be called the typhoid fly, for it spreads many diseases by wiping its polluted feet over our food. In order to fight this nuisance effectively go right to headquarters and destroy the breeding places at the barn. You may kill 10,000 eggs with the energy required to "swat" one fly.

THERE are so many "days" to be observed now that one who tries to keep track of them is quite likely to be dazed. Now comes "Rooster Day," organized by the Department of Agriculture for observation in Kentucky and Tennessee. On that day (May 16) poultry dealers have agreed to pay the same prices for roosters that they do for hens or pullets. The object is to kill off the surplus roosters as part of the campaign for infertile eggs. The fact is that after May 15, 95 per cent of the roosters in this country are of no value except for food, and with the ordinary scrub that is very tough value. One-third of the fearful loss in the egg trade is due to the fertile egg, and this keeping a flock of surplus roosters around is worse than robbing your own henroost. "Rooster Day" is all right. Call in the friends and celebrate this new "day" by serving chicken pie.

*

I USED to think that I didn't have time to read farm papers, but have come to the belief that it pays to take time, especially THE R. N.-Y. G. W. M.
New York.

We can remember when a United States Senator stood up in the Senate and denounced farm papers as grafters and blackmailers. There was no use replying to him. There was no reply except that of history. The blackmailers were sure to betray themselves, the honest papers to be known as such. It was necessary for the farm papers to prove that they gave sincere and honest service to their readers. The doctor is said to bury his mistakes, the lawyer may "lay it on the judge," and the farmer can plow them under. The editor must stand by his printed record. No man could be a grafter and blackmailer very long and escape the clear, critical eyes of the half million people who read THE RURAL NEW-YORKER each week. Surely a paper that cannot make itself so interesting or forcible that people will be forced to read it does not fill any public want. Farm journalism is steadily gaining in character. When more of the farm papers get away from the dead level of platitudes and mount the hills where vital issues are to be found they will gain faster.

*

IN the midst of all this shouting and flag-waving over Mexico THE RURAL NEW-YORKER sincerely hopes that there will be no war. Of course we run the risk of being called cowards and "mollycoddles" for making that statement, but we can stand that with great philosophy. With a Civil War family record of three dead and two wounded in the previous generation, we know just what war means in its effect upon children, women and home far better than the swashbucklers who fight with their mouths at a very safe distance from the front. We also know that war and war talk have ever been the means employed by politicians and schemers to divert the minds of the common people from a study of their natural business rights. In this country we are now at the beginning of a mighty development in coöperation and social education. It will take years of patient work and study to reach higher ground, but if the plain people give their thought to it, blessings beyond calculation will follow. A "war scare" is the old trick—hoary as the ages—of diverting public attention from the really essential things which have now come into public thought. True, there have been and will be holy wars where great questions of human rights were and are at stake. There is nothing of the sort in this disreputable Mexican quarrel—nothing to arouse true patriotism or the higher feelings of the human heart. "Let us have peace!" that our plain people may win the victory against prejudice and political evils which has been started. The war screamers might well march out against the political evils right at home.

BREVITIES.

How shall we bring the Christmas egg to pass? Put a May egg down into water glass?

BEAR in mind that very live steam is needed properly to cook "canned goods." Boiling is not enough.

YOU probably never saw a crank who did not have "wheels in his head." Yet work without wheels is dead.

IT is now suggested that merely dipping the egg in water glass and letting it dry will serve as well as keeping it in the solution. We doubt it. Better stick to the old, approved method.

A GREAT trade in hog hair has developed in England. This hair is used in making brushes. Surely everything about the hog except his squeal is now utilized, and the scientists are at work evolving a squeal-less hog.

IN discussing the price of baby chicks has any farmer figured what it costs to hatch a chick in the incubator or under a hen? Count eggs, time, fuel and care, and divide by the number actually hatched. What does the chick cost?

WOMAN AND HOME

Among Gardens Along the Riviera

The Home of the Flowers

:: By Prof. Charles S. Plumb ::

There is a rather narrow strip of land that for over 300 miles borders the Mediterranean Sea along the coasts of Italy and France. This is commonly known as the Riviera, with the Gulf of Genoa the central part. All along this coast rugged mountains prevail, with but a narrow strip of level land at best, between foot hills and shore. These mountains rise by degrees into the high crests of the Maritime Alps but few miles back from the sea. The Winter months along this shore are milder and more sunny than elsewhere in Europe, because the high snow-covered mountains keep back the cold winds. For many years this has been a famous Winter resort, so that today one finds a continuous line of towns and cities touching elbows along much of this coast. Through this region Roman legions built roads and found their way en route to Britain, and centuries after, Napoleon in their trail, constructed along the steep mountain sides overlooking this beautiful, many-colored sea, some of the finest roads in the world. Each Winter hundreds of thousands of visitors come to this balmy region from all over the world, seeking rest and a mild, almost frost-free Winter.

This Riviera has an interesting vegetation. Of good soil, one sees but little. Sometimes almost treeless mountains come abruptly to the sea, as along by Monte Carlo and Nice. Yet there are many valleys and narrow river bottoms where the soil is very good. On the mountainsides where the sun's rays penetrate, up to not too chill an elevation, olive orchards prevail to a great extent. In fact until comparatively recent years, the farmers along this coast looked to the olive as about the only source of income. A very common sight is a little stone village perched on the mountainside or top, with extensive olive orchards all about. These villages are built very compactly, the houses joined together, forming a resisting wall on the exterior of the town, with narrow, dark, unsanitary streets within. Were you to walk through one of these villages so common along here, you could think of nothing but the times of the middle ages. Here these farmers located, probably largely for protection from the Saracens or from the pirates of the sea. Each town was in fact almost a fortress upon a hill.

But this land of sunshine and mellow Winter days was found suited to other crops than the olive. The palm has for centuries grown to perfection along the lower sheltered spots, and its picturesque leaves are seen in tropical style along much of the shore. Here at Bordighera, where a cape juts a bit into the sea, palm culture is a business, and it is said that 50,000 trees alone are found in this town of 4,000 population. Each year Rome receives from this place large numbers of palm leaves for Palm Sunday procession, while they also find a market in other parts of Europe for the Jewish celebrations. Modern civilization however, has worked a wonderful change here, as seen in the character of the landscape and in the habits of an army of people who but a few years ago looked to the olive for their annual income. Now flowers grow in wonderful profusion, and about every residence, in enclosed gardens, one sees a great variety of plants, producing a wide range of color and growing in great luxuriance. Palms, oranges, lemons, great century plants here and there with lofty flower stalk in bloom, geraniums, pansies, roses of all kinds, carnations, gilliflowers, beautiful feathery mimosas, attract the eye. Here in this region of rocky hillsides, stone walls are features on every side, and over these trail vines that in season are rich in bloom, a luxuriance of growth unknown elsewhere. One sees these vines covering walls with glorious effect. Along the country road not far from where I write, is a wall nearly 20 feet high, where now for two months geraniums richly dotted with pink bloom have hung in heavy festoons more than half way to the roadside.

Yet the real great change that is taking place along this Mediterranean shore is the production of flowers, commercially, to supply the needs of the European

"IN THE GOOD OLD SUMMER TIME."

market. The poor farmer along this coast found that the tourist was glad to buy his flowers, and so the garden became a source of income. Then he must meet more special needs, and the demand came for flowers of a kind and in quantity. Not only was the demand a local one, but it came from without. Shipments were made to points at a distance, and the business grew, until finally the owner of olive orchard began to destroy the source of this income, and replace it with one from flowers. And so right now a great transformation is taking place here. Already thousands of acres of olive orchards have been cut down, the land has been terraced, and behind the stone walls which hold back the little gardens of precious soil, will be seen rows of plants grown for flowers only. One may go out in any direction along the mountainsides and see the work of destruction and construction in progress. Great cement water tanks from 15 to 25 feet in diameter dot the hillsides, to furnish water for irrigation. While the rose and the carnation are the principal flowers grown, one sees some others, including gilliflowers, mimosas, violets, Anemones, hyacinths, etc. Here and there, where a few years ago only the olive groves could be seen, now one finds the land terraced to the summits, little cottages dotting the landscape, and the gardens dotted with men and women busily at work. These are an industrious people, as can easily be seen when one considers the conditions under which they live. They are owners of small pieces of land, and this more frequently than not is far from the highway, and is available by mule path only. In fact many of these little villages have no artery of commerce excepting a narrow mule or donkey path up the mountainside. As one goes about here, he finds the donkey or mule a vital factor in their transportation and labor problems. He is commonly adjusted for hauling on his back sacks of different supplies, or his back is used minus the sack. Most of the manure used in the flower gardens, and it is no small amount, is hauled up the mountainside on mule back in packs from the roadsides below where it has been hauled in carts. Then the land is spaded and worked to a surprising degree. I have noticed many gardeners' turning the soil to a depth of 15 to 20 inches and more. The plants are placed in regular rows, arrangements are provided for water by narrow irrigation ditches, usually of stone, and everything is systematic of arrangement and is given most attentive care.

A great commercial flower business is now found along this Riviera country, one of the large industries of its kind in the world, with Nice as the main center. Flowers are shipped in baskets all over Europe, to London, Berlin, Geneva, Vienna, and all points between. Here and there the producer either brings his flowers in to the local dealer, or disposes of them on the market, after which they are shipped in baskets similar to those used for parcel post in some European countries. Buyers deal in flowers in a large way.

Near where the writer is now stopping, is a small town, not far from the boundary between France and Italy. Each day in this little town, Sunday included, is held a local flower market on a public square adjoining the railway station. Producers from the entire surrounding country for miles, come in with baskets of flowers, or armfuls wrapped in paper. Each person secures a place in line on the market, pays a tax of two cents to the local municipality for the privilege of selling, and here seeks his buyer. The baskets are kept covered until the taxes are all collected, when a whistle is blown, and at once every cover is removed. As a rule the carnation sellers are in groups, and the same with those bringing roses. Buyers come here to purchase, bringing big empty baskets, and in an hour or two the market is all over, and everyone is en route home. It is a striking sight, this little market. Now in February 500 persons each day gather to sell, and just before Christmas as many as 800 come together. Here one may see in this little town four solid rows of carnations about four feet wide and the length of the square, perhaps 300 feet. Late in February I saw some of the choicest of carnations, eight dozens to the bunch, sell for just about $1 a bunch, and I bought a bunch, not so good, but very nice ones for a franc, or 20 cents. One may get all the violets desired for two cents a bunch of 50, while the same number in America more commonly sell for a dollar.

It is an interesting sight, the gathering of the people in this market. One meets the women on foot walking along with a big basket of flowers on the head. Here in Italy the peasant woman uses her head for carrying many things, and it is a common sight to see them along the country pathway, deftly balancing a big basket of flowers on the head. Yesterday, while walking along a country road, we met a woman with a basket at least four feet long, two wide and 15 inches high. By her side were two men, one carrying a baby that my wife says was not over six weeks old, and just as we came opposite them, the woman took the baby, and continued her walk, quite indifferent to the big basket on her head. Besides these people carrying flowers afoot, one meets many hauling baskets in carts, while along the shore, the street cars and regular trains also do a large business. In fact in France a special train each day gathers flowers at the different stations, just as milk trains run special in America.

In localities special phases of the flower industry have developed. In one trip among the hills in Italy, the writer found almost nothing but roses grown. In this neighborhood where I am now writing, carnations are the popular favorite. Up at Grasse, in France, a great perfumery industry has developed. Baedecker states that there are 35 perfumery factories here, and that 60,000 acres are devoted to flower culture, yielding annually 2,000 tons of roses and 2,500 tons of orange blossoms. Enormous quantities of violets are also grown here for perfumery, that from this flower giving great fame to this region.

The interest in flowers here is so universal that each Winter what is known as a "battle of flowers," and a flower carnival is held in different towns along the Riviera. Carriages and automobiles are decorated to more or less extent, some very beautifully, and these parade, while the occupants and onlookers exchange a fusillade of small boquets, to the edification of all. In the parade at Nice on Saturday last, several hundreds of vehicles were in line, and an enormous crowd of spectators participated. Even the small towns partake of their spirit of floral enthusiasm. However, a real lover of flowers cannot take much satisfaction

(*Continued on page 637.*)

Woman and the Home

The Bluebird.

Though Winter's power fades away,
The tyrant does not yield;
But still he holds a waning sway
O'er hill and stream and field.

But while he still is lingering,
Some lovely days appear,
Bright heralds from the train of Spring,
To tell that she is near.

It is as if a day of heaven
Had fallen from on high,
And God's own smiles, for sunlight given
Were smiling through the sky.

The bluebird now, with joyous note,
His song of welcome sings;
Joy swells melodious in his throat,
Joy quivers in his wings.

No cunning show of art severe,
But soft and low his lay—
A sunbeam shining to the ear—
Spring's softest, brightest ray.

Those magic tones call from the past
The sunny hours of youth;
And shining hopes come thronging fast
From worlds of love and truth.

The harmony is seen and heard;
For notes and rays combine
And joys and hopes, and sun and bird,
All seem to sing and shine.

—Noble Butler.

Love of Life.

Love you not the tall trees spreading wide
their branches,
Cooling with their green shade the sunny
days of June?
Love you not the little bird lost among
the leaflets,
Dreamily repeating a quaint, brief tune?

Is there not a joy in the waste windy
places,
Is there not a song by the long dusty
way?
Is there not a glory in the sudden hour of
struggle;
Is there not a peace in the long quiet
day?

Love you not the meadows with the deep
lush grasses;
Love you not the cloud-flocks noiseless in
their flight?
Love you not the cool wind that stirs to
meet the sunrise;
Love you not the stillness of the warm
Summer night?

Have you never wept with a grief that
slowly passes,
Have you never laughed when a joy goes
running by?
Know you not the peace of rest that follows labor?
You have not learnt to live, then; how
can you dare to die?

—Tertius Van Dyke.

The Hills.

Now men there be that love the plain
With yellow cornland drest,
And others love the sleepy vales
Where lazy cattle rest;
But some men love the ancient hills,
And these have chosen best.

For in the hills a man may go
Forever as he list,
And see a net of distant worlds,
Where streams and valleys twist
A league below, and seem to hold
The whole earth in his fist.

Or if he tread the dales beneath
A new delight is his,
For every crest's a kingdom-edge
Whose conqueror he is,
And every fell the frontier
Of unguessed emperies.

And when the clouds are on the land
In shelter he may lie,
And watch adown the misty glens
The rain go marching by,
Along the silent flanks of fells
Whose heads are in the sky.

And in the hills are crystal tarns
As deep as maiden's eyes,
About whose edge at middle-noon
The heavy sunshine lies,
And deep therein the troll-folk dwell,
Can make men wonderous wise.

The gorse of Spring is like a host
Of warriors in gold
And Summer heather like a cloak
Of purple on the wold,
While Autumn's russet bracken is
Monks' livery of old.

Our lord the sun knows every land,
But most he loves the fells;
At morning-break his earliest torch
Upon their summit dwells,
At eve he lingers there to catch
The sound of vesper bells.

The men who dwell among the hills
Have eyes both strong and kind,
For as they go about their works
In heaven's sun and wind,
The spirit of the established hills
Gives them the steadfast mind.

—W. N. Hodgson.

SPEAKING of "prize babies" on page 641, the judges at baby contests now have a "scale of points" for estimating the value of the coming President. We shall print this "scale" a little later. There ought to be three judges, some woman who "just loves babies," a child who has been crowded out of first place in the family by some new cherub, and some cold-blooded old doctor who knows bone and muscle and lung.

*

IN some localities, distant from a good hotel, farmers' wives can do a fair business catering to automobile parties. During the Summer thousands of parties tour the country, and they are often compelled to stop for dinner or over night at the hotels in small towns. These places are usually beer saloons with a "hotel" attachment, and are seldom comfortable. Such travellers would much rather stop at a clean roomy farmhouse, and when such a place was once found every guest would prove a living advertisement for it. What is more, such guests would in many cases, be only too glad to trade direct with the farmer and buy what he could supply in food.

*

NOT long since the troubles of a "high life" couple in New York were aired in the newspapers. They were to separate. The wife found her husband too slow because he had to work to earn a living. The husband, a good lawyer, could not keep up with his wife. She had nothing on earth to do but go from one form of amusement to another—dancing, card playing, eating or "entertaining." This man worked all day at his profession, and was then expected to attend parties until after midnight and get up for another day's work. There was no scandal, but the wife actually played so hard that the man could not keep up and do his work. Such things are bad enough with the idle rich, but they become pitifully wicked when people of moderate means try to give a poor imitation of this shirking of home work and care.

*

WOMEN certainly voted in Illinois, and their influence was felt. We have been told that the lower classes of women would vote, while others would not, also that while city women might vote, country women did not care. The Illinois election disproves both statements. The country women voters displayed more independence than their city sisters. Their votes made 22 Illinois counties "dry." It must be clear to anyone who can think that when the majority of women want the ballot they will get it. But should they have it until they give some indication that a majority of them want it?

*

"*Denmark is full of skilled women.*" That statement is made by H. Rider Haggard in his book on "Rural Denmark." Mr. Haggard tells how, at every turn, women are found doing the milk testing, egg selecting, analyzing and other work wherein accurate skill is needed. He says that trained women do this work better than men, since they are neater and more conscientious. Denmark has set the entire world an example of what coöperative work will do for a nation. Danish farmers could not have developed their dairy business except through scientific accuracy so as to save wastes. It seems that the women are doing much of this work for them. True coöperation will be impossible without the active work of women.

*

WOMEN and girls are winning all sorts of prizes in contests with men and boys. The latest is a contest at collecting the egg masses of the "tent caterpillar." Western Michigan was over-run with these pests, and prizes were offered to the school children who would climb the trees and secure the greatest number of these egg masses. The best report thus far is by Miss Vera Stickney of Wexford County, Michigan. She captured 2,800 of the masses, each containing no less than 200 eggs. The single school to which she belongs destroyed a total of 6,885 egg masses. The school children have taken great interest in this contest. It is a good thing to encourage, and it's good also to see the girls winning these prizes.

*

THE other day in a crowded elevator a number of women were talking excitedly. One of them rapidly turned her head, and a sharp hatpin which protruded four or five inches outside of her hat missed the writer's eye by the mere fraction of an inch. A woman walking on the street, met a friend who led a little girl by the hand. The first woman was so overjoyed to see this child that she caught her up in her arms, and brought her head down to kiss the child. The point of one of these savage hatpins entered the child's cheek within an inch of its eye. Dozens of cases can be given where this deadly hatpin has put eyes out of commission, scratched faces, and wrought havoc in general. The State of New Jersey tried to frame a law which would prohibit women from wearing these pins unless the point was protected or covered by some blunt attachment. It was laughed out of practice, and called a fool law, yet the hatpin handled as many women wear it in crowded places, is a nuisance and a danger. The sharp point should never be left outside of the hat, but should be cut off to a blunt point, or else covered with some protector which would take off the point and render it less liable to destroy the sight of an eye.

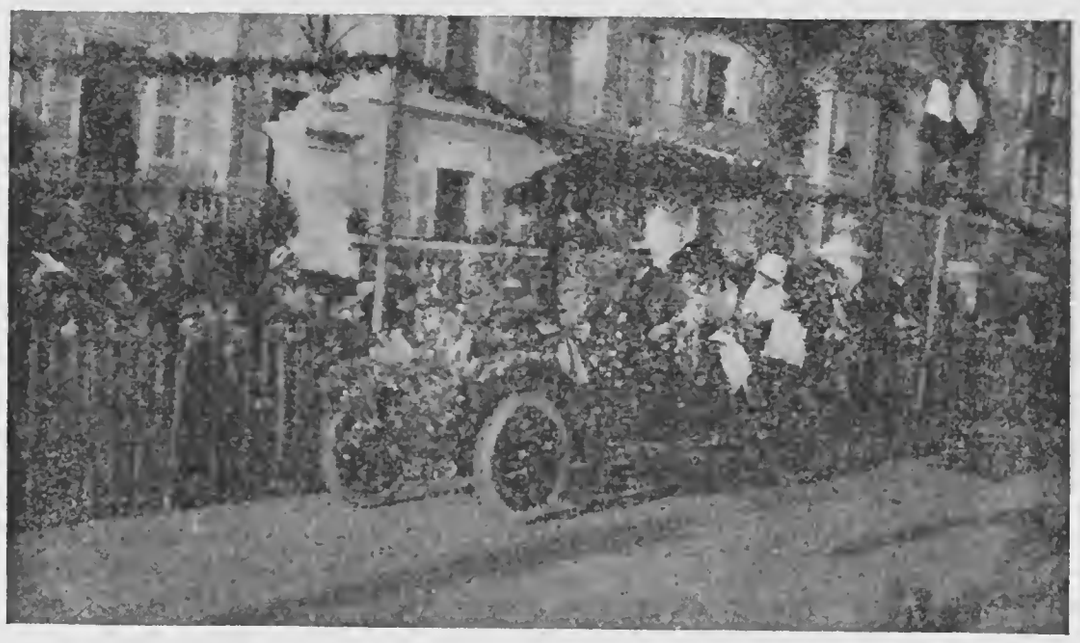
*

HERE is a lesson for farmer's daughters who wish to go to the city. We came 'back to the land' 18 years ago. In an isolated locality, two other farms joined us. The three could total 12 daughters. Eleven of the 12 are married, and the last one engaged. As far as the returns have been received there are about 25 grandchildren. None of the girls married a farmer. In the nearby village, many of the girls worked in the local stores and factories, and some secured jobs in New York. We had to total 30 families before we could find 12 daughters married in the same period of time.

FRANK HYDE.

But is the chief object with our daughters to get them "married off?" As not one of these girls married a farmer, it does not seem that moving to the country had much to do with it. Perhaps these girls became better housekeepers in the country than they would have done in town. At any rate this is a novel argument for "back-to-the-landing."

FLOWER GARDENS ON A TERRACED ITALIAN HILLSIDE.



FLORAL PARADE AT MENTONE, FRANCE. (See Page 633.)

The Tramp Hens Trapped.

Your advice to the Methodist minister reminds me of an incident that took place here many years ago. Mr. C. had a barn, horse, cow and a nice neighbor who kept a number of chickens, which made his barnyard and garden a favorite place to get a large part of their living. Several requests to Mr. S. to keep his chickens up bringing no results, Mr. C. purchased a fine healthy rooster and shut him up in his barn for a few days. After he was wonted to the place he fixed up a nice lot of nests and turned the bird out. Not long after he asked Mr. S. to come over and see his fine rooster. After showing his good points he turned to Mr. S. and said: "Mr. S. although he is the only chicken I have I am getting from 6 to 10 eggs a day." As this was about the number of eggs Mr. S.'s hens had fallen off, and several of them were cackling in the barn, Mr. S. took the hint, and Mr. C. was bothered no more by the hens. S. T. W.

"Two Girls and $400."

On page 499 we printed among farm problems a letter from a woman in Michigan. This woman's capital consisted of two girls and $400. She wanted to find a place on a small farm where this capital would enable her to start and develop a home. We printed it as one of the hard problems which face many of our country women. The response to this was prompt. Within two weeks 34 letters came from all sections of the country. It was a most remarkable collection. One man expressed a willingness to marry this woman. Another was willing to put up with the two girls for a while if he could use the $400 in developing his farm. Most of the letters, however, came from worthy people, who stood in need of help on their farms, or were sincerely desirous of helping a worthy woman find a home. One letter came from a trained nurse in an Eastern city. Out of her savings she had purchased a small farm, which she was trying to develop in fruit, and at the same time retain her work at the hospital until she could accumulate sufficient capital. She thought that probably this woman with the two girls could take hold of the property and develop it for her. Then there were childless old people left upon farms which they did not care to give up, and yet felt unable to do the necessary work. These people could provide excellent homes for the right kind of workers. This statement of a problem attracted remarkable attention. The woman who wanted help is now corresponding with several people, and may find exactly what she wants in the way of a situation. The discussion of these problems brings out the very best part of what we call the RURAL family. There is always some one eager to help another, and our circulation is so widespread that usually such problems find their solution, and that is the best part of farm journalism as we see it.

TALKING IT OVER

Bits of Experience from Housekeepers about the Home and Its Helps

KEEPING BUTTER.—On page 508 M. W., Palisades, N. Y., asks how to keep or store butter for six months. I will give my method. For the past 23 years I have owned a general store, where the country people bring their butter in rolls, as many grades as there are customers in number. I take the good and the fairly good and wrap each roll in clean muslin that will wrap about twice around the roll, then pack them on their ends in an earthen crock, as many as I can force in. Then fill the crock with strong brine made from dairy salt, so it will carry a potato the size of a duck egg, and then weight it down. If the butter is wrapped it will not bleach in the brine. One pound prints wrapped in waxed paper will keep well in crocks. I have held from June or later, until the following April, just as good as when it was packed, two tiers of eight rolls to the tier in 20-gallon jars.

J. E. S.

FOR CHAPPED HANDS.—To prevent chapped hands, cracked fingers, etc., use the following mixture after washing and drying the hands: Glycerine one ounce; bay rum two ounces; rose water two ounces; quince seed one dram; water one-half pint. Boil quince seeds in the water, strain and let cool before adding the other ingredients. Quince seeds may be bought at drug stores. The quince seeds seem to overcome the drying effect of the glycerine, so irritating to delicate skins. This mixture has the added advantage of leaving the hands clean; one can work without leaving a smear.

J. F. C.

SOOT FOR CUCUMBER BEETLES.—On page 444 I see unslaked lime and sulphur mixed is advised as a repellent for striped cucumber beetle. Plain common soot from the kitchen stove is just as good, and like June, may be had by the poorest.

J. F. C.

BURNING OUT CHIMNEY.—Your correspondent, N. C. R., on page 296, speaks of the new way (to her) of cleaning chimneys. That is a very old and very common way. But I think the method should be given with a word of caution. Burning out a chimney ought never to be attempted except on a rainy day. There is great danger from sparks outside, otherwise. And there should be plenty of help in case the heated chimney fires the woodwork around it. Sometimes one cannot bear the hand on the bricks, they become so heated. MRS. J. E. C.

A HINT ON BAKING POTATOES.—The next time you wash the potatoes for baking, try putting them in hot water and rub hard with a cloth, instead of the vegetable brush, and see how white they will be, and how easily they will clean. Then rinse in another dish of hot water and rub dry with another dry cloth. Prepared in this way, they will bake much more quickly. C. A. B.

FRESHENING LEMONS.—If lemons that are somewhat dry, are placed in a can of fresh buttermilk, they will become very much fresher and much better to use; they can also be kept for several weeks in the buttermilk. This is much better than placing them in water to keep them fresh. C. A. B.

KEEPING BUTTER.—M. W., Palisades, N. Y., asks how to keep butter for eight months. I have for nearly 20 years bought butter by the tub. I pack it solid in large stone crocks, leaving a space of about an inch on the top. This space I fill with brine as strong as possible. The crocks are best kept in a cool cellar. If the butter is perfectly fresh when put away it will keep a year. In taking out for use care must be exercised to keep the butter covered with the brine, for exposure to the air will quickly spoil it.

E. S. MILLER.

BITS OF WISDOM.—When beating eggs or cream have them cold as possible, and they will froth up better. Just enough hot water in the chocolate to melt, and then mix with brown sugar so as to spread even, makes a nice and quick frosting. For a change fry ham in the oven with a little sweet milk. Fry sausage in the oven for a nice brown without drying out. Can sausage after frying and seal in hot grease and have a feast in the Summer. When making sausage try sprinkling the seasoning in the cut meat and then grind, saving mixing. Place the cake tin when taking from the oven in a wet cloth, and find how much nicer the cake leaves the tin. When making oatmeal cookies soak the oatmeal in the milk at least 15 minutes before mixing. Vinegar will remove water mark from glass. If the good man when spraying with lime and sulphur will first rub his hands in vinegar, then wash the usual way he will find the hands nice and clean.

M. E. M. H.

TWO SUGGESTIONS.—In using pieces of carpet for rugs, instead of hemming the ends, ravel each end for two or three inches and tie the warp. It will never come undone and looks neater than a hem or binding. A wire potato masher is excellent to mix pancakes or any thin batter. The lumps come out so quickly, and there is no splashing. I always use it to give a final stirring to apple sauce.

MRS. KATE BASHORE.

HOT DRINKS.—Some one asked for a hot drink to use at night. Probably the inquirer is familiar with the commercial beverages, but wants something different After a long illness, the nurse made ginger tea for me by pouring a cup of boiling water on one-quarter teaspoon of ground ginger, let it settle, then poured off or strained the liquid, adding sugar and milk to taste. She gave me this at night, when I was chilly and couldn't sleep. A Boston specialist has her patients make cayenne pepper tea in a similar way, about as much pepper as one could take up on the point of the small blade of a penknife. This is stimulating and surely not insipid. Personally I have no use for it, because mother made us take Cayenne pepper and molasses when sister and I quarrelled in our little days. It worked. EDNA S. KNAPP.

SEASONING A CHOPPING BOWL.—A good plan when in need of a chopping bowl is to buy cottonwood bowls. When first purchased, before they are used at all, put into a wash boiler, cover with cold water, let heat to boiling point and boil for an hour or more, then take the boiler from the fire and let the bowl cool with the water. This process seasons the wood. If used before boiling, the inside becomes wet first and swells more than the outside, and the split follows as a consequence. A. M. M.

THE KITCHEN LIGHT.—A simple convenience which helps much in cooking breakfast on dark mornings, is a small shelf on the wall, above the kitchen table, just high enough to hold a lamp where the light will fall directly upon the top of the range. When the lamp was on the table, one could not see whether the griddle cakes were browning too much or not. Besides the lamp, there is room for the salt and pepper, so constantly needed, and a few other things. A drawer slides beneath the shelf, and at one end hang the kitchen scissors, which are often in demand. In the top of one corner of the shelf is a tack, from which the jelly bag can be suspended and drip into the dish on the table. E. F. M.

A Western Housekeeper Talks.

In this Western country where the houses are usually small and not conveniently arranged, many little makeshifts are resorted to. I am fortunate in living in a five-room house, which is called large in this great plains country of Colorado, and also have a little pantry and clothes closet besides. I find the gallon cans that canned pie fruit come in of great use in many ways, also the gallon syrup cans, one of which I use for a churn. As we have but one cow at present our 20-gallon barrel churn is too large and heavy for a small amount of cream, so my husband made a little dasher of an old chair round, cutting off the outside so it was clean and white and fitting pieces across one end, cutting a hole in the can cover for dasher. As this has to be larger somewhat than the wash, cream will splatter, so I took a small can lid, cutting hole just large enough for dash to work easily. Two quarts of cream can be churned in it, making usually two pounds of butter, and by churning often it does away with much hard work and also make a fine quality of butter. One of these cans I keep on the work table in the kitchen, where it is handy for many things; another is used for a double boiler.

In one of my dish cupboard drawers I have a little whetstone which is very handy; there is also a ball of cord. When cord is wanted we know just where it is, and save time and steps. A can opener and corkscrew combined is in this drawer together with other articles of everyday use.

An old white oil cloth came into my possession and I have made good use of it in covering the kitchen table where dishes are washed and cooking done. On the wall above the table another piece keeps the paper clean, and still another part is back of the cook stove to protect the wall there. On the table I keep a small can in which I put paring knives, cooking fork and a few clothes pins. The pins I use every day for hanging dish towels and clothes on the line, and it is handier than going every time to the large bag where they are kept.

One little grinding mill we greatly prize; not only because so handy, but saves dollars in course of the year. Its cost was only $1.35 from a mail order house. We grind chicken feed, coarse or fine, there being a screw to regulate it. We have our own cornmeal, soup, and breakfast food when we wish, taking clean wheat after washing and drying, grinding medium fine, and cooking slowly for some time. A coffee mill is fastened to the wall by screws, holds one pound of coffee berries; a screw top makes it air tight. A little cup holding four tablespoonfuls is on top ready to hold under the spout when grinding. We never buy the ground coffee.

MRS. FREDERICK C. JOHNSON.

Plain Talk About Paint.

In answer to E. W. S., page 455, in regard to paint, "Dutch" green, is what is known to the trade as bronze green. It is made up as he states of blind green, as a base, adding lampblack and burnt sienna in minute quantities until desired shade is had. E. W. S. must have met a misfit lot of painters who never heard of three of the commonest standard colors painters use. Let E. W. S. procure blind, chrome, permanent, or empire green; all of these are the same green with different labels on the cans. Take one-half gallon cold pressed linseed oil, one-half gallon turpentine, five pounds green (any of above) one pound burnt sienna, one-quarter pound lamp black, one-half pint Japan dryer. Mix together, tie a piece of cheesecloth on a pail, strain above through it, and you have a green paint that is as nearly wear-proof as paint can be made. Don't be afraid to use plenty of paint and plenty of elbow grease to spread it, and above anything else get a paint brush—a real one.

In regard to "glue paint," any other color will do as well. But why use "glue paint" at all? Why not use white lead, and cold pressed linseed oil? You'll save money and get a satisfying job.

On that porch take a putty knife and No. 2½ sandpaper, scrape and scratch and clean off every particle of paint, dirt, scales or anything else you can get off. Then mix to every gallon of paint you think you need 12½ pounds old Dutch process white lead, one-half gallon cold pressed linseed oil, one quart turpentine, one-quarter pound litharge (procured at drug store if not at paint shop). Before adding litharge break up separately a very little lampblack and add thereto until dark enough. Put on with a good brush. You may have to thin down some to use on first coat; if so do so with oil only. Allow plenty time between coats to harden, and you can safely eat any of this paint that chips off. Applied as above I can absolutely guarantee it to wear. A. F. R.

Burden Bearer and Partner

Some remarkable things are being said about women these days—mostly by other women. Miss Mabel Powers, in a recent speech, described what she calls **"The Hatrack Woman"**:

When primal man had won a victory, he had to have some place to deposit the beads and necklaces and other spoils of war. He had no home—not even a cave, as yet—and it was too much trouble to carry them around. So he hung them on his partner; woman was degraded from a mate to a hatrack, and from this beginning we have the plaything women of to-day. Girls quit playing with dolls at the age of 12, but some men find amusement in dolls all their lives.

It is probably true that some women are still content to act as "hatracks," or advertisements of their husband's or their father's ability to gain property, but THE RURAL NEW-YORKER does not reach many of them. The women who belong to THE RURAL family are not "hatracks" but burden bearers. They are not always profit sharers, but they **are** sharers of labor, care and responsibility—the true guardians of the home and of the generations to follow us.

Woman and Home is for Them

THE RURAL NEW-YORKER has been made strong and useful through the co-operation of its readers. They have made the paper their own. It has strength because it faithfully reflects their desires and their opinions. Now we want our women readers to take a good-sized share of the paper and use it to express their special desires and needs. The men have never yet failed to respond when help was needed. The women will be even keener to do their share now that opportunity is offered.

Experienced Information Wanted

Here are some of the things our women folks want to know about:

CARE OF THE CANARY BIRD.

KEEPING SUMMER BOARDERS.

THE VILLAGE DRESSMAKER. We would like to hear from some skillful dressmaker who can give us hints and suggestions about clothes.

THE BRIGHT SIDE OF LIFE. Short, humorous sketches from everyday life. Make them short and tell them naturally.

We can pay for such suitable sketches. Tell them as you would write a friendly letter. The chief object of WOMAN AND HOME is to help country women. This includes amusement and entertainment, but does not stop there, or with food and clothing. There are hard problems to be worked out in many farm homes. Sometimes they are too hard to be worked out alone. Sympathy and kindly confidence may help make them lighter. We want to help if we can. Tell us how we can be of service to you, and you will find all the power of THE RURAL NEW-YORKER at your command.

Parcel Post For Farm Women

:: :: Aid To Better Business :: ::

The mistress of Apple-Tree Farm was troubled all Winter because she was getting only 30 cents a dozen for eggs when the city folks were paying 50. Why doesn't she find out something about egg-mailing boxes, and go after that 50 cents herself? The parcel post is at her service, as well as at yours and mine.

Let us see what can be done with eggs. Postage in the second zone on two dozen eggs will be about eight cents. The mailing cases to carry two dozen will cost her in the neighborhood of 10 cents each. Then if she is going to do the thing nicely, there will be a further cost for a roll of smooth, brown wrapping paper to wrap the box, and for tissue paper or cotton to wrap each egg. The expenses will reach 18 or 20 cents a package, which means nine or 10 cents on every dozen sold, and this cost will remain the same whether eggs are worth 50 cents or 20. Customers who buy a few eggs when they are high-priced will want more when they are cheap, so Mrs. Brown must make her calculations for the year, and not reason that there is no money in it in June, and that she will give it up then and resume it in November; but she must know whether the profits of the high-priced months will be enough to carry her through the low-priced ones, or she must sell so many of the cheap eggs that a very tiny profit on each will mount up to a nice little sum. I have used eggs as an illustration because there is more talk just now about mailing eggs than any other farm product; but Mrs. Brown has many things on the farm that are as desirable for mailing as eggs. Perhaps she has time on her hands in the Winter when she could make shirt waists for other women or rompers for other women's children; and what about the maple syrup, mailable in sealed tins—or maple sugar and maple candy, mailable in almost any package? Is there a city near enough for her asparagus and green peas to reach customers in better shape than the wilted goods the grocers sell? And how about dressed chickens and sausages and home-cured hams? Berry boxes are made nowadays for mailing, and cartons to carry peaches and apples. I saw an advertisement the other day of a cooked chicken dinner with plum pudding and vegetables and all the fixings, which was to be sent the customer by mail, and I have eaten delicious soft-shell crabs sent ready cooked to a town where sea food was ordinarily unobtainable. Has she or have we got anything to sell that other people would like to buy, and are we doing anything about getting our goods to market?

The business of marketing by mail is a new one for everybody, and none of us can boast of much experience, but all of us can try experiments, knowing that anything that draws city and country, or town and town together must benefit both. Even if our experiments do not lead to great success in independent selling, we shall at least be in a better position to judge the middleman who has been handling our goods. Maybe after all it costs more than we thought to get things to market. But if we are going to try to establish a little business let us start in with a confident expectation of making it a success, and a resolution to be as patient in bringing up a young business as any other young thing. It is almost certain that at first the expenses will be greater than the returns, and many will say "It was too much bother," and it didn't pay, before the little enterprise had a fair chance to grow up. Many women dislike keeping accounts, but if we are going into business we must be able to tell what our expenses are and what returns we are getting, and careful calculations made beforehand may save a disappointing failure. Foresight is a lot more useful than hindsight.

But assuming that the farm has a good and desirable article to sell, and that Mrs. Brown knows how important it is to have a neat container for it, and fresh brown paper to wrap it in; that she appreciates the fact that fresh laundered waists must be tied to the bottom of the box and covered with tissue paper to preserve their dainty freshness; assuming that she wraps up her fruit so that it does not bruise, and her eggs so that they do not break, there is still one important part of her business to consider, and that is how to find customers.

There are lots of different ways of advertising beside putting a notice in the newspapers or having a billboard put up near the railroad track. The newspaper kind of advertising costs a good deal, and it is just as well for her to get her business started before venturing on a very great outlay on such notices. The surest way for her to find a market right away is for her to send samples and some sort of notification to people who know her or about her. Let us suppose that she wishes to sell maple nut fudge. First, I think she should make out a list, beginning with everybody who bought any of the Apple-tree crops last year—I should include everybody, the butcher who bought the calf and the city buyer who took the apples. Then I should add the Summer boarders who stayed with her last year, and if the neighbors were willing, the boarders who stayed with them and at Our Town Inn. I should include the former minister who left Our Town for a city church, and Sister Annie's daughter at boarding school, and her husband's nephew at Cornell. I should have 50 or 100 post cards printed or typewritten, or if that was too costly should write very carefully and plainly something like this:

> **APPLE-TREE FARM, OURTOWN, NEW YORK**
>
> **HOMEMADE MAPLE NUT FUDGE.** We are sending you a sample of our Maple Nut Fudge and hope to receive your order for one or more pounds. Our Fudge is home-made from our own maple syrup, carefully packed in neat cartons and sent postpaid on receipt of price in cash, stamps or P. O. order. 1 lb., 40c.; 2 lb., 75c.; 5 lbs., $1.50.
>
> *Ask for our prices on Maple Syrup in sealed tins.*

Then I should do up two or three ounces of the fudge, wrapping it carefully in paraffin paper, and daintily in brown or white wrapping paper, and send a post card and sample to every one on the list. I think Mrs. Brown would find that some of the people replied and that a few orders came in. And if her goods are really worth the price she asks she will soon find many people who are glad to get them. She must not be discouraged if customers are slow to respond, and if it takes a long time to pay for the first outlay on stamps and samples. The beginning is the hardest part. She must remember that this is a new business for everybody and not be discouraged if she makes some mistakes. Uncle Sam is giving her the same rates that he gives the biggest Chicago mail order houses, but he leaves Mrs. Brown to find out what use she can make of parcel post. Perhaps she will get some unexpected returns; perhaps this will lead to finding a better market for the main crops. The minister in the city may not want any fudge, but would like a barrel of Astrachan apples sent by freight next August. Since she has reminded him of Apple-tree Farm he will bring his custom there. I think she will soon find her little enterprise of value in many ways, all looking toward better business on the farm.

E. F.

Three Advertisements Free

IN order to encourage farm women to develop direct trade through parcel post THE R. N.-Y. will print free of cost in the May issue of Woman and Home three advertisements of farm produce for sale. These will appear in the

Subscribers' Exchange Department

The advertisers must be genuine farm women—wives or relatives of farmers who live on the farm and who offer home-grown or homemade goods for sale. The goods must be reliable and enough in quantity to supply a fair trade. We will use our judgment, after considering the circumstances, as to which advertisements to use, and will, if desired help arrange the form of the advertisement. The object of this is to show by practical illustration the possibilities of developing direct trade. Farm women who would like to try this should write us fully what they have to offer, with a clear description of it.

Direct Trade in Food.

A Maine subscriber tells us how he had developed a great direct trade in sauerkraut, horse radish, pickles and similar food. Here is an extract from his circular:

I am sending quotations of the following articles that I put up: Pure horseradish, per doz., $1; 2½ gal. keg of sauerkraut, $1.25; 4 gal. keg of sauerkraut, $1.50; 6 gal. keg of sauerkraut, $2; ½ bbl. of sauerkraut, 115 lbs. net, $3.25; 20 lb. keg of salted dandelion greens, $2.20; 30 lb. keg of salted dandelion greens, $3; vegetable salad, 9 oz. bottle, per doz., $1.50; pure apple jelly, per doz., $1.50; cucumber pickles, put up in mustard, salt, sugar, vinegar and a small amount of alum, 2½ gal. kegs, $1.75.

These are all simple food articles. You would think most families would provide their own supply. Yet this man has developed a great trade in which he gets the 100-cent dollar. His goods are always clean and uniform, and one package sells another. His trade is conducted on business principles, and is just as legitimate as any other. We shall keep on giving these little stories about selling food, for along this line is the great opportunity for farmers' wives and daughters.

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards their property and their children. There will be direct answers to actual questions and general statements of law.]

Partition of Property.

What redress has a wife here in California if a farm is owned by her husband and herself, but he refuses to live on it, and will not sign a deed for its sale? There are two minor children, he partly contributes to their support. The wife is desirous of moving to town where she can support herself; is not strong enough physically to manage a farm. Is there no way she can get her share of money from the farm? W. N. W.

California.

You and your husband probably own the farm as tenants in common, and the only way for you to obtain your share of the value of the farm is to sell your interest in it, if anyone will buy, although it is probable that no one would care to buy under the circumstances. Failing in this you could commence what is called a partition proceeding to separate your common interest in the farm. After this is completed you could sell the part that was given you.

M. D.

Minor and Bank Account.

Will you let me know if my youngest sister, who is only 19 years old, can draw money from a savings bank which was in my mother's name, and put in trust of my sister through death? Now she is married can she put that money in her own and her husband's name, when she is only a minor. A. O. E.

New York.

Everything would depend on how and in whose name the money was deposited in the bank. If it was deposited in the mother's name the bank will probably not pay it out to the daughter unless letters of administration have been granted on the mother's estate, and a guardian appointed for the daughter. If, however, it was placed there in the name of the daughter, she can probably obtain the money at any time, or change it into her own name. The bank will be quite careful to see that it is paid out in accordance with the legal requirements, especially if the sum is large. It would be well to confer with an officer of the bank.

Property in Trust in Will.

Will you tell a widow having a married son (the only living child, he having a wife and children), how to make a will leaving an unencumbered farm for the said son for life, after his death to be equally divided for the grandchildren? Also how to word the will making her daughter-in-law executor or trustee after the death of said son provided she, the daughter-in-law, outlives the husband, also to make will so as to protect the property from any debts of said son.

South Carolina. H. B. G.

To do as you wish your will should contain the following provisions:

"I give and devise to my executor and trustee hereinafter named in fee simple my farm (describe sufficiently to identify) in trust nevertheless to manage and conserve said real property and to collect and receive the rent, income and profits thereof and to pay over the income thereof to my son..... during his life, and upon his death to convey said real property in fee simple to his children then living in equal shares.

"I hereby appoint my son..... the executor of and trustee under this my last will and testament, and on his death I appoint my daughter-in-law..... his successor as executor and trustee of this my last will and testament, and I direct that neither my son nor my daughter-in-law shall give any bond as such executor and trustee."

Inasmuch as the executor holds the property in trust for the children, it will not be liable for the debts of the son, and there is no need of making a provision for this in the will. M. D.

Wife's Right in Husband's Property.

Will you let me know as to a wife's right? My husband has never left home, and he is a man of 50 years, just married a year now. His mother and father deeded the farm to him, and he is to pay the other children so much at father's death. The mother has been dead three years next August. The father is 83 years. I would like to know if I have to work here and get nothing if my husband should predecease me? J. H. R.

Michigan.

It would appear from your letter that your husband is under some sort of a contract with his father with regard to the property by which the rights of the other children must be recognized. Just as soon as your husband obtains title to the property, in himself, your rights also attach, and may not be got rid of without your signing them away. Your interest amounts to a one-third part of all land of your husband for your life. It would appear that by a recent amendment of the laws of Michigan, in 1909, a widow is given one-third of the lands absolutely, which, of course, is a larger interest than a one-third interest for life.

M. D.

Giving Property to Incompetent.

Suppose you had an heir to your property, and you knew the prospective heir was incompetent to manage or keep the property, or if you wanted to give or deed some property to some incompetent person, how could you make the transfer so that the receiver could not sell, give it away, mortgage it, lease it for more than a year at a time, or in any way make it liable to debts, damage, or any other executions? G. W. S.

The way to dispose of your property for the benefit of the incompetent would be to give it to trustees to manage and conserve and pay over the income and profits to the incompetent as long as he lives, and then the trustees can deed it to whoever you name. If the incompetent has property of his own, there is no way he can "fix it" so that it cannot be used to pay his debts; that is, he cannot dispose of his property to defeat his creditors, but if he is incompetent an application can be made to a court for the appointment of a committee to administer his property and affairs.

M. D.

Change of Name.

Having married for the second time, and having two sons by first marriage, I should like to change their name to my present one. Can you advise me whether I have to go to the courts? If so, which one? S. S.

New York.

The legal way for you to change your sons' names is by application to court. This is neither a costly nor lengthy proceeding. However, if there is no property involved, and the boys are young, there appears to be no objection to their assuming your name without court action. But this would make it harder for them to trace their identity later on.

Among the Gardens Along the Riviera

(*Continued from page 633.*)

in seeing pretty bouquets ground under feet of horse or crushed by wheels. They might be used to some much better purpose.

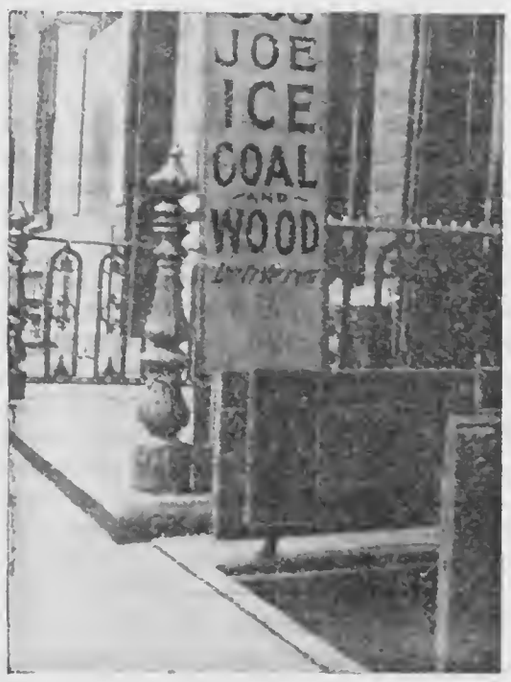
That this flower industry is a great thing for these people along the Mediterranean there is no doubt. Men who a few years ago purchased small tracts of land on the mountainsides for a comparatively small sum, have done extremely well financially, and their land has

"FLOWER GIRL" GOING TO MARKET.

increased greatly in value. But one may well wonder if this business is not going to be overdone. Great quantities of flowers for the market are produced during the Winter months on the south coast of England, and on the Seilly and Channel Islands. Only a few days ago I read in an English paper of tons of violets being destroyed in London, as a drug on the market. Just now prices here are low, and undoubtedly a very large and increasing production is on. Nevertheless a great industry is established to the everlasting credit of these people.

A Humble City Merchant.

The picture shows the business sign of a type of small retailer of which there are several thousand in New York. The sign always reads Joe or Johnnie (often Jonnie) or whatever the merchant's first name is. The cellar doors in the picture are the entrance to Joe's place of business. A basement is used because



HOME OF THE $1.75 DOLLAR.

the rent is cheaper ($5 to $10 per month) and the ice keeps better than above ground. It is bought from the large dealer's wagon, one or two cakes at a time, cut into five and ten-cent pieces and delivered at once. Some of the retailers have small hand carts for delivery and others carry it in a wood tub on their backs. Competition is sharp, many residence blocks in the vicinity of THE R. N.-Y. office having two or three of these small dealers.

The quantity of stock kept varies with the season. As cool weather approaches they will have at least half a cord of kindling and a ton each of large and small coal. The wood sells in five and ten-cent lots at the rate of about $30 per cord; the coal, 10 pounds for five cents; and ice, one-half to three-fourths cent per pound.

Developing the Farm Woman.

I find a great many useful helps on the women's page, and may sometime be able to give some one a little help. But it is help I am asking for at present. I would like your help in this way. Is there anything a farmer's wife can do to earn money? I have thought of making candy to sell, but I know but little about it, and then another idea I had was to make canvas gloves, such as men wear. Please give me some idea of how to go about this and how I may learn the way of making the candy, and if you think it would be profitable. MRS. E. S.

This woman mentions two enterprises she had thought of taking up. All that we need to consider about these enterprises is that either of them would change her from a producer to a manufacturer. The whole world is crying aloud for more producers. The army of the unemployed comes from the other ranks. What is the matter with this farm and countless other farms that fail to support the family? Undeveloped resources. Some years ago I was sent sprawling, as you might say, into possession of such a farm and such a family. As a farmer I think I stood pretty near the foot of the class; as a financier I had one fixed principle. I must spend less than I made. I like to spend, so here was incentive to make. When I began I saw so many things that needed doing, while my pair of not very strong hands could do only a few of them. I saw I must have labor-saving helps. I wanted a bread-mixer. The case stood about like this: I had two dollars, the price of the bread-mixer; the price also of the warm drawers a member of the family needed. In the house were two undershirts so thick and heavy their owner would never wear them. I took those shirts and made them into drawers, which lasted their wearer three seasons and were enthusiastically declared to be the warmest and most comfortable that person had ever worn, and I had my bread-mixer into the bargain and a lot of fun thrown in for good measure. One woman, laughing until the tears started, said: "Anyone who could make a pair of drawers out of a shirt deserved to succeed."

I found I saved 20 minutes every time I made bread. I might easily have dawdled this time away. I applied it to my out-of-door enterprises, the chickens and the garden. From this beginning I now have every labor-saver I want that I know of, save one, and that is under consideration. But to go back to my spending, I made a study of how I should spend. Whatever I buy is of good quality. For instance an aluminum wash basin at 50 cents is doing daily duty in an iron sink apparently as good as ever after 10 years. In provisioning the family exhaustive study has brought some astonishing results. I could borrow money at six per cent, buy the provisions at the new rate, sell them to the family at the old rate, and make a handsome profit.

Rome was not built in a day, neither was my other success—marketing the two money crops. It took at least two years to accomplish this, but for four years in one case and three in the other it has been simply a case of delivering the goods and cashing checks. Again, I could borrow money at six per cent, buy the money crops from the family at the old price, sell them at the new price, and make a handsome profit. These profits are of course my contribution to the family income.

Once upon a time to keep the wolf from the door, I made gloves until I could get a better job. I believe in doing anything that is honest if obliged to, but as a matter of choice I would never make canvas gloves. My knowledge of the candy business is second-hand. A friend who tried it was glad to quit. A great candy manufacturer used to come to the sanitarium where I was in training. Candy eating made an invalid of him, as it has of many others. If this woman must do something, I suggest raising early cucumbers for one thing. I have never tried, but I read of starting them under glass in the ground. I know there is demand for them here. Women need to get out of doors more, not mew up sewing or making candy. C.

System in Housecleaning.

Spring is such a busy time for everyone; nature itself seems to be working overtime to send forth the green grass and the beautiful flowers, and even the birds are on the wing, getting in readiness the homes in which to rear their young. The rush of outdoor work gets the good man out early, and teams and farming implements are busy from morn till night getting in the crops. The old saying, "one hour in the morning is worth two in the afternoon" seems very true, especially on the farm. House cleaning seems to be the interesting subject for the housewife these nice warm days, and before the rush of canning and jellies come in our way.

We always begin in the cellar; it is a good plan to carry out decayed apples, potatoes, or vegetables along through the Winter. It is much more healthful and it leaves less to do in the Spring. It is also a good plan to give the cellar wall a coat of whitewash, and if you do not have a cement floor to scrape off the damp earth; it will look better and seem sweet and clean.

After the cellar I go to the top and work down. Before beginning any room all the boxes and drawers are gone over, Winter clothes sorted out and put away again; paper rags sold, carpet rags looked over. Some do not believe in rag carpets, but I do, and hope always to have one for my dining room. Where there are children there are usually some good out-grown clothes that some of your neighbors would be very glad of, and they would be out of your way. When I pack Winter clothes away, each article, or several if they are the same kind, are wrapped in papers or put in paper sacks and marked. They need less handling over when you want them in the Fall.

If one has papering done and the family does not do the work themselves, it is necessary to have more than one room torn up at a time, but even then it can be done in such a way that the house does not seem to be topsy-turvy all over. The children can help in various ways, removing small articles of furniture, pulling tacks if you have carpets, and tearing off the old paper.

If we have room to move our furniture around, a little change here or there helps us to feel better, and when the last finishing touch is put to our work it makes us feel like beginning life over again. MRS. R. M. STAFFORD.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

It's FREE

Men everywhere like to know exactly what the best dressed business men of New York are wearing. The Glen Rock Style Book tells you—tells you as well as a visit to New York. Page after page of men's fashion ideas. But this will interest you most—this booklet contains handsome Fashion Plates and 40 sample pieces of the very woolens which New York men consider "the thing" this very minute.

So much for style. Have you ever worn a Glen Rock suit or overcoat? If you have, you know that the fit is perfect. You know that every detail of tailoring is most expertly done. You must know that every Glen Rock garment is made from good material, for garments which give you such long wear as "Glen Rocks" do are made only of good materials. Prices all the way from $10 to $22.

Here's the "Glen Rock" plan. Every garment guaranteed a perfect fit and stylishly made. Because we sell to you direct (from the mill) we save you at least $8.00 on every suit or overcoat. You see you save the retailer's profit. Get in on this plan. We save you money! We want to make you a friend of ours.

Rearranging the Farm House

A Study of Household Management

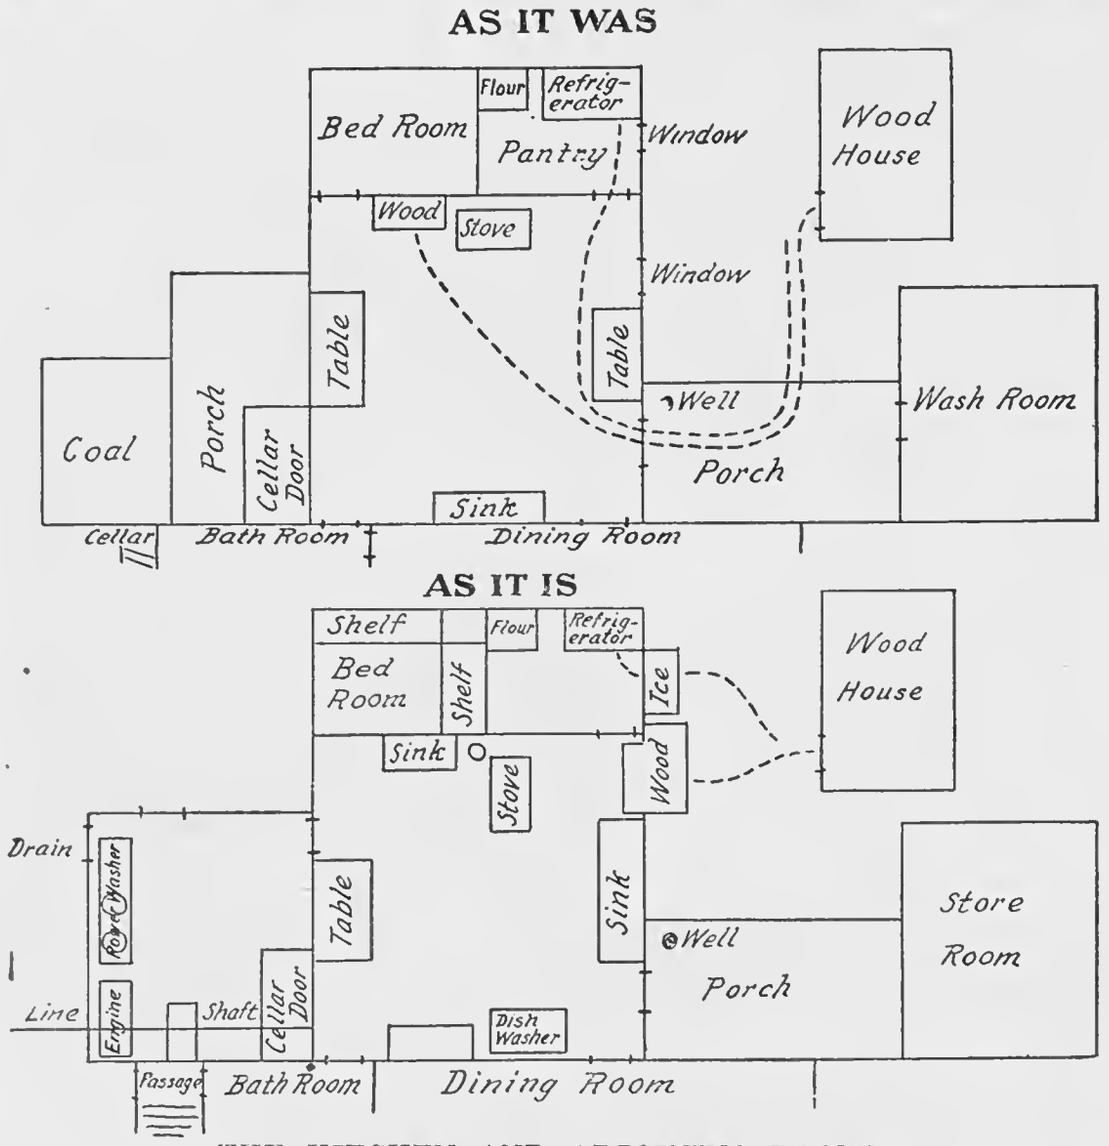
By A Farmer's Wife

PART II.

Above the bureau is a dish cupboard, and beside it, next to the dining-room door, stands the dishwashing machine, which has done faithful duty for nearly 21 years. This machine is a large galvanized iron box, fitted with wire racks into which the dishes are placed, and by turning a crank the water is thrown over them rapidly and later drawn off through a faucet in the bottom. These wires need to be taken out once or twice a year and the whole thing cleaned, as a scum-like substance gradually accumulates upon it. In answer to our inquiries regarding the machine, a lot of testimonials were sent, among them being one by Mrs. T. K. Beecher, sister-in-law of the famous Henry Ward Beecher, and she described her method of preparing the dishes for the machine, which we have always followed. She used a whisk broom (we now use a sink brush) and dish of hot water, sweeping the dirt from the dishes. A moment's thought will show any one that this method is a much more rapid way than scraping with a knife or even one of the new rubber plate scrapers. I never bother to pile each size of plates, etc., by themselves, but as fast as a few are swept they are placed in the machine, where there are racks for the different sizes, cups, silver, etc. I also put in the lamp chimneys. When our family was large the dishes were washed after each meal; now that it is smaller they are put in, excepting silver, and lid closed and left until the machine is full, or nearly so. The process of washing requires about three minutes, one for washing, and one-third each for two rinsings. The silver and chimneys are wiped and rest left to dry. If the dishes are not clean do not blame the machine; look for the cause and you will find it. Perhaps not enough soap was used, or the water was not hot enough; again some large dishes might have been placed so that the water could not reach others. The dishwasher will give good satisfaction if properly run. For soap I slice up a cake of ordinary laundry soap, add a couple of heaping tablespoons of washing powder, fill the basin with *cold* water and set it where it will heat slowly. When hot it is dissolved and is set off. This makes a jelly-like soap, easily dissolved, and is much more convenient for almost all uses than a cake.

And now a word as to the other dishes. When preparing a meal it is necessary for the worker to be in almost constant attendance, and with a dishpan of water and tea kettle all ready, it is but a moment's work to wash the different cooking utensils as they are emptied. By doing this, which really takes so little extra effort, when the meal is ready to be served, all or nearly all the most disagreeable part of the dishwashing is done, and afterwards there are left only the table dishes. This method seems to lighten the drudgery of the housework the most of anything I have ever tried; especially will one appreciate it when cooking for thrashers, hay-pressers, etc. In these cases it is well to begin 15 or 20 minutes earlier. It means a little closer application while in the kitchen, but well repays in the time saved. For the cooking dishes I find that some one of the scouring powders are a great help, and also a substance called steel wool, which comes in little rolls. A lump of this (which looks like curled hair), used with a little powder, will scrape a dish very readliy. After using, it needs to be rinsed and placed where it will dry, otherwise it will rust. It comes with paint supplies.

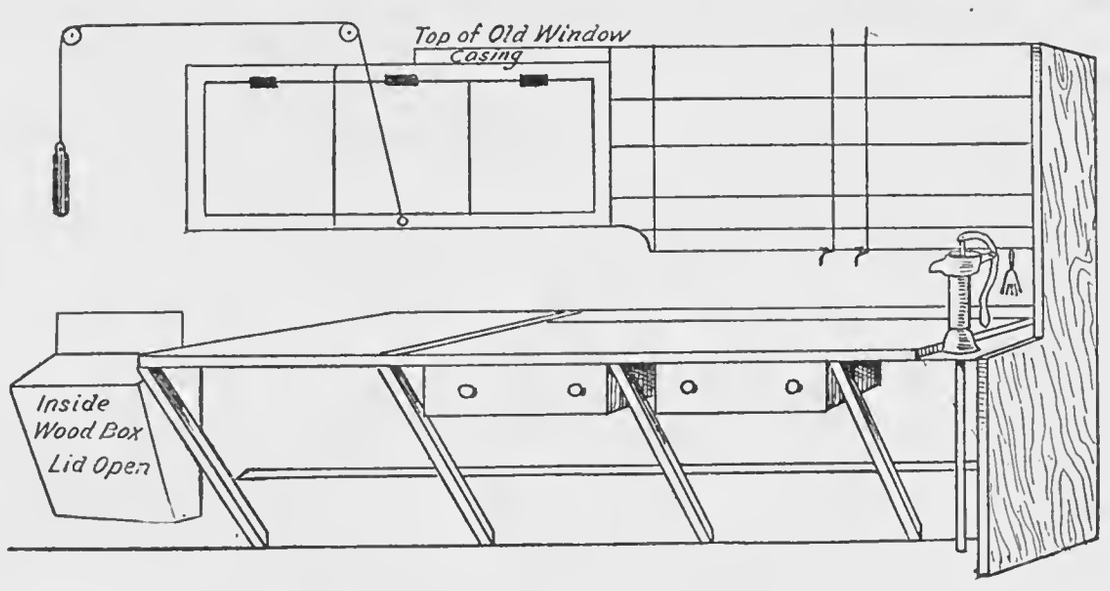
A couple of years ago my husband bought a small gasoline engine (two horse-power) with which to saw wood. Following the example of others in this locality, we installed this sturdy little helper in the house and find that it has revolutionized some parts of our housework to no small extent. Before this we had never seen any way to a water system, though we had put in the bathroom several years before, putting a 20-barrel galvanized tank in one of the attics, which was filled from the roof, with an overflow leading to cistern. This tank supplied the bathroom with cold water, and being adjacent to the kitchen, we could manage the hot water very easily. There was no water to be piped



THE KITCHEN AND ADJOINING ROOMS.

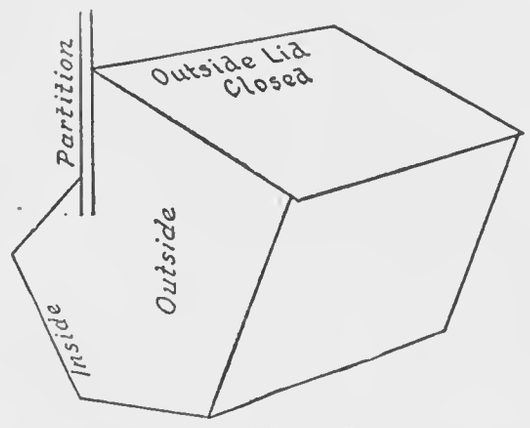
to the house without coming a long way, and we were fearful that if we sunk another well it would drain the one we have. After getting the engine, however, we built a large cistern in the cellar. This was made possible by the rambling style of the house, producing a large amount of roof space. We then bought a small rotary pump, costing about $8. Pipes were connected from this to both cisterns, and to the tank above. This gives us a very liberal supply of soft water. For all our plumbing we are indebted to a neighbor who lives on an adjoining farm, and who is a great genius. He, together with husband and sons, installed our steam heat, bathroom water system and engine. His wife and I purchased a vacuum cleaner together, which cost us $35. The one cleaner does the work of both houses very easily. It is an ordinary hand cleaner, requiring two persons to operate it. Our neighbor, who very correctly styles himself "The Handy Man," removed the crank shaft entirely, as it is run with an engine in their house as well as in ours.

Referring to the diagrams again, it will be seen that out of a porch and coal room we made a good-sized room adjacent to the kitchen on the left. In one corner of this room stands the engine, and by the side of it the vacuum cleaner upon a little platform. A hole was cut through the wall into the passageway between bedroom and bathroom. We bought 50 feet of ordinary garden hose, and taking the irons from the short hose that came with the cleaner, fitted them on to the other, and with this hose connected with the cleaner through this little opening in the wall. We can go either way and thus clean all the rooms. For the rooms above a hole was cut through the ceiling into the hall above; this was cased with a piece of eaves conductor pipe. The hose is pushed up through this, and we can thus reach anywhere on the upper floor, and the cleaner does just as thorough work with the 50 feet as with the 10 feet that came with it. Not wishing to bother with such a long piece of hose for the nearby room, it was cut once to a length just right for the dining-room. The dealer readily supplied another pair of irons, taken from a discarded hose. Above the engine was adjusted a long



SINK AND SHELF CONVENIENCES.

piece of gas pipe, reaching across the room and extending out of doors several feet. This is for a line shaft, and by means of this the vacuum cleaner is run and also the little pump, the latter being in the cellar, the outside door of which



DOUBLE WOOD BOX.

is in this room. A short shaft was fastened to one side of this cellar-way, directly under the line shaft above and about half way down. On this was fastened two pulleys, one of which is belted to the shaft above and the other to the pump, which stands just inside the cellar door. In the corner opposite the engine stands the power washer, and connects with the engine by a belt direct without going to the line shaft. We were quite fortunate in having our attention called to this machine, as it is the most complete of any I have ever seen, and cost no more than the older styles, $25. The machine is on one end of a platform of about seven feet; this leaves enough room for another tub and basket. The wringer is so constructed that it will operate from machine into tub, and *vice-versa*, and also swing over into other side of tub and wring the clothes into the basket while the washer is working. All this is accomplished with pedals. Back of the tub is a drain, thus only necessitating turning the tub over into it for emptying. For the machine we use one of the pieces of hose used for the cleaner. In putting in the water system two pipes were installed, leading to the machine from the kitchen, each having a gate or cut-off. By this means we can run both hot and cold water to the machine, and also into tub by use of a very short piece of hose, connected on to the pipes. Thus it is possible to wash indefinitely without rubbing the clothes or carrying any water. Having had our washing done away from the house for about 24 years, we find this a great saving in expenses. The engine has already paid for itself and the washing machine, and being still in seemingly good health, I think will, in time, pay for the rest of the improvements. We hope to have an ironer, and should we stop marketing our milk, we have a place for separator and churn. I find it very easy to operate the engine. I learned to stop it at first, and then to start it. Outside, where the line shaft extends, the men are expecting to establish a grindstone. This finishes our tour of inspection, and I earnestly hope that the readers may have gained some helpful hints to repay them for the trip.

Burning Out Chimneys.

In THE R. N.-Y. of Feb. 28th, I see a paragraph on chimney cleaning. We always clean our chimneys by burning them out with straw, but although we have a tin roof we are always careful to choose a day when there is no wind to carry sparks, and one when the buildings are damp. Then when the chimneys are burning we go from room to room through which the chimney goes—including the garret—to keep watch. Sometimes the wall-paper scorches around the stovepipe hole, or the tin that closes the hole gets red hot. Our house is nearly a hundred years old and with the large, well-built chimneys of those days, and taking the precautions I have mentioned, we consider it safe to clean the chimneys in this manner, in the country. In a house built as houses are now, or where the house is not isolated, we would not wish to run the risk. I was once in a house where a chimney got on fire by accident from a large open fire on the first floor, and in a third-story bedroom the supporting prongs of the tin in the stovepipe hole melted off, and the tin fell to the floor, burning the carpet. Flames came from the hole burning a shelf above the hole, and a bureau, before the trouble in the third-story room was discovered. A board held over the hole sent the draft and flames up until something more permanent could be done. A. H. W.

"Woodpile Day."

Start the ball rolling for "Woodpile Day." There is no reform so needed to make country life endurable for women as the sure supply of the year's wood, dry and secure. This especially applies to the South. I wrote you of the terrible suffering here, and sickness and death even among my neighbors, who rarely have a week's wood ahead. J. K.

There are too many special "days" now, but some of the present celebrations might well be cut out to make room for "Woodpile Day." Woodpile and water—there are the two great necessities for kitchen life, and kitchen life holds the home together. Are women justified in going on a strike when they must use green wood and tramp out after water? Thousands of men have struck for less and then gone home to pose as heroes in the eyes of their women folks.

Eating in Hot Weather

OUTDOOR MEALS.—Since it is the decree of the twentieth century to live out of doors as much as possible the year round, it is far and away the best place to take our meals during the hot months. If you have a wide back porch, or a strip of green grass in the back yard, where you can establish your dining-room, and still be convenient to the kitchen, you can ask for nothing better. The flies will, perhaps, be the only drawback, but since these nuisances breed and flourish only where food is allowed to stand uncovered, and in garbage dumps, and dirt heaps, they can be easily abolished, just as mosquitoes can be, by draining swampy spots, and by preventing unsanitary conditions to be fostered on or near the premises. If these conditions cannot be entirely controlled, the porch can be screened, or a little Summer house, large enough for table and chairs, built on the strip of green grass, and screened, would be ideal; this need not be expensive, and the pleasure gained from it in one season would more than overbalance the small outlay.

SIMPLE FOODS.—Hot weather meals, especially when they are to be served out of doors, should not have too many frills, just simple nourishing things made a little more attractive than at other times to tempt flagging appetites. It is the cool things we long for most; dishes we relish on cool days fail to inspire us when the mercury stands at 90 in the shade, and a meal of cold meat or fish, salad, etc., with say one light hot dish, fruit, and some simple dessert, made principally of milk and eggs, either chilled or frozen, is better than a heavy hot one. The ice cream freezer is a perfect blessing to the housekeeper in Summer, for it will help to furnish any variety of delicious, wholesome desserts that can be easily and quickly made.

HOT DISHES.—When there must be hot meals, plan to have enough food prepared for left-overs, to be utilized in tempting cold dishes for the next day. Have the meat a roast of some kind, beef, veal, lamb, or chicken, that can be cooked early in the morning while it is cool. A pan of baked beans, served with plenty of good Boston brown bread, cottage cheese, and a lettuce salad, followed with some simple dessert, makes a substantial meal, easy to prepare and serve, either on the porch, lawn, in the woods, or down by the river. A chicken and veal loaf is very satisfactory served cold. This is an excellent recipe: First remove the flesh from the bones of a three pound fowl or chicken, and cut into small pieces. Wipe two pounds of lean veal; trim off all skin and membrane and cut up also, then add to the chicken with one-half pound of sliced salt pork, and force all through the meat chopper. To the meat add four cream crackers, rolled fine, one cup of milk, three tablespoonfuls of lemon juice, one tablespoonful of minced onion, salt, pepper and a little chopped green pepper. Mix all thoroughly together, and pack a long narrow cake tin even full with the mixture. Lay some thin slices of fat salt pork over the top, and bake in a quick oven for the first 10 minutes, then reduce the temperature of the oven to a moderate heat, and continue baking for two hours longer, basting now and then with a little melted butter and hot water. Cool, and remove from the tin.

MAKING THINGS ATTRACTIVE.—The garnishing of a dish should receive special attention, shredded lettuce, cress, parsley, nasturtium blossoms, slices of lemon, or hard-boiled eggs, will go a long way in giving the cold meat or salad a pleasing and appetizing appearance. If the meat course is to be cold roast lamb, carefully trim and daintily shape the slices, then arrange them overlapping one another on a chilled platter, and surround with a border of parsley or cress. If this is to be a picnic or company dish, a border of hard-boiled eggs, cut in halves crosswise and deviled, with the parsley or cress, will make it a decidedly festive pièce de resistance. Or, if you are going to have lemon sherbet for the dessert, cut the lemons into halves, and after scooping out the inside, cut a slice from the bottom of each shell so it will stand alone, and fill these with cold cooked peas, mixed well with a good salad dressing, and arrange around the slices of cold roast beef, or chicken loaf. Mint jelly is delicious with cold lamb, so instead of the deviled eggs you might have a mold of mint jelly turned out in the centre of the dish, and the slices of cold meat placed around it.

JELLIED FISH is very nice, too, on hot days. Boil any white fish in just enough water to cover it, add a tablespoonful of lemon juice, a little salt, pepper, two cloves, and a bay leaf. When the fish is done drain it and flake. Cook the stock a little longer or until it is reduced to two cups, then pour boiling hot over one tablespoonful of granulated gelatine; dissolve, and strain the stock. Pour a portion of it in the bottom of a mold, cool, and add the fish; turn the remaining stock over it, and chill. Serve unmolded, within a circle of sliced cucumbers, moistened with French dressing.

EATING OUT OF DOORS IN HOT WEATHER.

SALADS.—A well-prepared salad, chilled and attractively served will often tempt one to eat when nothing would. Even an ordinary one of potatoes can be made one of the prettiest of luncheon or supper dishes when served in green pepper cases. The salad can be made from your own favorite rule. For the pepper cases, divide medium-sized green peppers into halves, remove the seeds and membrane, and parboil for a few minutes in salted water, then drain, chill, and fill lightly, with the salad. Another pretty form of serving this salad is gained by packing the potato mixture into the pepper shells while they are still hot, after parboiling, then chill, and cut into slices, and serve with a spoonful of mayonnaise disposed on each slice. There is another attractive vegetable salad, which tastes as well as it looks, this is made by cutting up some well cooked string beans; add an equal amount of cooked peas, beets cut in cubes, and carrots. Pour a little slightly sweetened lemon jelly in the bottom of individual molds, let this harden, then fill two-thirds full with the vegetables, and pour more of the jelly over the top. Chill until firm, and serve unmolded on lettuce, and pass mayonnaise or a cream dressing with it. Still another tempting salad is made by peeling little red and yellow tomatoes, an equal number of each, lay these alternately, one red and one yellow, on white lettuce leaves, and cover, just before sending to the table, with a simple oil and vinegar dressing.

SANDWICHES are easier to serve out of doors than bread and butter, for they save extra dishes. These can be the plain bread-and-butter folds when cold meat is served, or they can be made a substantial part of the meal, by using chopped meat, cold boiled eggs, or cheese, for fillings. Then there can be those with sweet fillings, to be used in lieu of cake. When you want your sandwiches specially nice beat the butter with a wooden spoon until creamy and smooth, and cut the slices very thin, remove the crust, and cut in fancy shapes or roll.

ROSAMOND LAMPMAN.

Some Canadian Recipes.

The following recipes without eggs might have been more useful earlier in the season. The housekeeper will be pleased at the size and excellence of this simple pudding: One cup of suet, one cup of raisins, one cup molasses, two cups milk, three cups flour, one teaspoonful soda. Steam two hours. Lemon sauce particularly good with this.

Graham, oatmeal or oatflake cookies: Three cups graham, oatmeal, or oatflake flour, two cups common flour, one cup lard, one cup milk, one cup sugar, one teaspoonful soda. Mix lard into flour, then add sugar, milk and soda last.

Ginger cookies: One cup of sugar, one cup molasses, one cup melted dripping, one cup boiling water, two teaspoonfuls soda, two teaspoonfuls ginger, two teaspoonfuls vanilla. Stir thick with flour, let it stand over night, roll out thin and bake. A most convenient recipe.

Another recipe that astonishes every cook who makes it for the first time is: 1½ cup flour, the pinch of salt that should go into most recipes, teaspoonful of baking powder, or soda and cream tartar, one cup of sugar, mixed well together. Break egg into cup, beat slightly, fill with milk, flavor, add to dry ingredients, bake immediately.

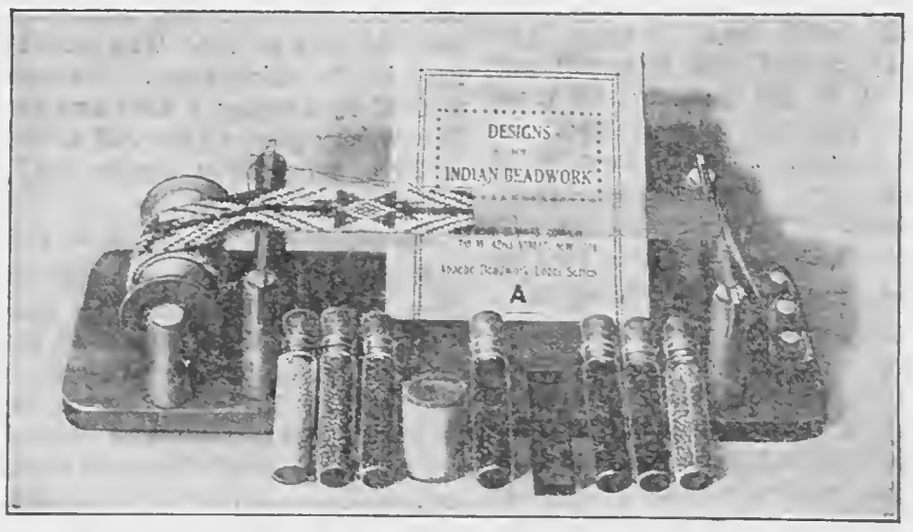
Indian Bead Work



NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION
OR
THREE YEARLY RENEWAL SUBSCRIPTIONS
(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

The Common Question

The question last month related to keeping hams and bacon through the Summer:

The method (used by most of the neighbors) of storing ham and bacon for Summer use seems to be to slice it just as they do for use, then cook it about half what they would for the table, lay it in a common crock, and pour on grease enough to cover it. Then slice and fry another spiderful and so on. This saves the ham, but it does not make very rich eating next Summer. I would like to get some method that will enable us to lay the whole ham away until wanted, then have it fresh and juicy as it is in March. W. H. P.

Rural housewives have given us the following notes:

We have cut it as we would for cooking and packed it in a gallon jar, then set in oven and let bake until the meat is cooked. While it is hot we put a weight on and the grease covers it. We had some put down in that way that kept until a year from the next Summer, and was good. MRS. SARAH E. TAYLOR.

Iowa.

The U. S. Navy packs its hams in the following manner: The hams are first wrapped in oiled paper, then covered with cloth. They are then packed in small barrels holding about 100 pounds; the space between the hams being filled with fine salt. The hams thus packed keep perfectly. A. B. RANDALL.

New Hampshire.

This is my way of keeping smoked ham through the Summer. Do each ham up separately, in brown paper, or what is better, a paper flour bag, and inclose it in a meal bag, then bury in a barrel of wood ashes, and keep in the cellar or a cool place. When wanted for use take the ham out, cut off what is required, and replace in the ashes. I usually cut off enough for two or three meals.

MRS. CHAS. E. MARTINE.

Northern New Hampshire.

I am enclosing small piece of shoulder which was butchered December 15, 1912, and hence has survived one Summer's heat. After removal from smokehouse the meat is given a light sprinkling of powdered borax and suspended from the ceiling of the storeroom, each piece so hung that it does not touch any other. A couple of windows are left open for circulation of air. You will notice that our meat is skinned, as we prefer it that way, and then too the brine penetrates more thoroughly. This shoulder and a couple of strips of bacon were left from last year's supply and this Spring were dropped in the ham brine for a few days with the other meat. The meat will not mould, and flies will not touch it. It is the easiest and most satisfactory way of preservation we have found as yet. Hope it may be of use to others. "FARMER'S WIFE.

Long Island.

R. N.-Y.—This slice of ham was in good condition—excellent meat.

Hog-killing generally begins here November 15, and is all over by Christmas, except one or two are killed later for the purpose of getting fresh meat and sausage. It is salted down the day after killing, when perfectly cool. If it is frozen, it should be thawed before salting, or it will spoil. The salt is well rubbed in, and also piled over the meat, and then packed in a box, where it is allowed to stay from four to six weeks, depending on size of meat and weather. The salt is then washed off, and meat hung up and smoked until brown, as is wanted. Hickory wood is preferred for smoking, but almost any wood will do. Before fly time comes, the hams are taken down, rubbed with red pepper and sacked in large thick paper sacks, which will hold a 30 or 40 pound ham; then hung up again, and we almost always have an old ham for next Christmas. The sides need no more attention after smoking, but can be left hanging until used. If care is taken with the salting, well smoked and sacks tied well, no meat will ever be lost down here, and certainly not in Ohio. R. JELLICORSE.

Tennessee.

I solved the problem of carrying ham and bacon through the Summer the past season in the following way: After hams were properly smoked they were sliced neatly, all bones cut out, then packed carefully in gallon jars to within an inch of top. A plate which fitted inside the jar was put on, then the jars put in a moderate oven and kept there two hours. When taken out the meat was covered with its own fat, which when taken out through the Summer is exactly like fresh ham, only better. After opening a jar and taking out for meals, the fat must be returned in sufficient quantities to keep meat well covered. When jars are put away cover with heavy brown paper.

MRS. C. M. MCALLISTER.

New York.

Here we have had perfect success in keeping hams and bacon in dry air slaked lime, and others have been equally successful. The hams and bacon have been cured in the following brine: To 100 pounds pork take six pounds salt, two pounds brown sugar, two ounces saltpetre, six gallons of water, or enough to cover the meat. Keep in pickle six or eight weeks, then hang it up to dry. If there is no smokehouse it may be painted with "liquid smoke." Some people might think this unwholesome, but we used it several years and are still very much alive. A molasses barrel is convenient for pickling the meat in. When the pieces are dry, they may each be wrapped tightly in strong brown paper. Then take a flour or sugar barrel, put in a layer of air slaked lime in pretty fine powder, then a piece or pieces of the wrapped meat, cover entirely with more lime, then put in more meat. Do this until the barrel is full, having an ample layer of lime on top. The barrel may be kept in the third story. We tested this method by keeping a ham two years and it was very good at the end of that time. It is a delightfully simple method and we think it excellent.

Pennsylvania. ALICE E. FENTEM.

Doubtless most farm housewives still keep ham and bacon by the method described in the March magazine section of THE R. N.-Y., but we think the product very inferior in flavor. Bacon especially is easily kept, though I experimented several years before learning how. Wrap each well smoked piece in paraffin paper, (doubtless parchment paper would be better), put the pieces in a paper flour sack and keep in any dry place. Ours is kept in an attic storeroom over the kitchen, where it is often very hot in Summer, but the heat seems to make no difference. We had still some when fresh meat came again; used the last to fry with the fresh liver. I have been told that smoked hams may be kept in the same way by merely shutting them away from the air and from insects, but I have always feared that the bone in them would cause trouble. We slice ours, trim and remove bone, then pack without cooking, in wide gallon jars and cover with lard, taking care to have it cool enough not to heat the meat. This keeps well in the cellar, but ours is kept in the refrigerator. A compartment might be made for it in the icehouse. The last of ours, in fine condition, was used when filling silo about the middle of September. Pieces from which the bone cannot be readily removed are packed by themselves and used first, or boiled for immediate use. I cannot see where it would be an advantage to keep the hams whole. A half's day's work slicing and packing the meat disposes of the job for the season, and it is in convenient shape for use at a moment's notice. We appreciate the new department in THE R. N.-Y. It was our best farm paper before, but it is better than ever now. The studies in cooperation promise to be very interesting, and we hope practically helpful.

CLARA E. MCDERMID.

While the meat will keep nicely fried, it never tastes like ham cut fresh and juicy from the bone. At one of our Ladies' Club meetings we discussed this subject, and I will give some of the recipes used by the members. Dip hams three minutes in boiling water to free from insects, then enclose them in bags made of cotton cloth boiled in starch with a generous spoonful of red pepper, neither insects or flies will trouble them. Hang in a cool place. Another lady gave this recipe as one used for many years. Sift wood ashes, place a deep layer in a clean box. Place a layer of meat, then more ashes, until meat is packed. The ashes are easily washed off having no effect on the meat. Keep in a cool dry place, making sure there is a thick layer of ashes on top. Another housekeeper said they always buried their meat deep down in the oat bin and found it perfect when used. Another said hams and bacon were fine rubbed well with black pepper, and that they were not too highly seasoned when it was washed off. Another covers hers with hot paraffin using a paint brush. They never mold or dry out, and the paraffin may be used many times by boiling it up and letting the particles in it settle, then pour it into a dish to use the next year.

Ohio. MRS. JAMES LAMPMAN.

If W. H. P. will sprinkle his hams and bacon thoroughly with powdered borax and leave them in the smokehouse he will have no trouble from flies, bugs or mould. I have done this for years, and never yet lost a ham, and have had ham until butchering time in the Fall or Winter. The smokehouse is an ordinary wooden structure—not insect proof. After taking a few slices off a ham that you do not care to use up at once, if you sprinkle borax on it it will not mould and is safe from flies, and can be hung back in the smokehouse. I have kept hams and bacon in this way until butchering time in the Fall or Winter.

New York. M. C. EDINGTON.

Years ago, we used to bury our hams in the oat bin, and they were always good until we used them up, some time in July. A better way is to put each one in a paper bag and pack in an apple barrel in oats, shaking the barrel down to pack the oats around them solid. They keep better packed in this way upstairs than they do in the cellar, not so likely to mold. A cut ham put in a bag and hung in a dark cellarway ought to keep until it is used up. Still a better way is to pack them in dry salt. Place a layer of salt in the bottom of a meat cask or a box and cover the meat with salt. We pack our strips of bacon with the hams and shoulders, and leave them in the cellar. They will keep forever; the only objection is they have to be freshened.

New York. MRS. KATE W. BUSHON.

"Do you think I can safely ask your daughter to marry me?" "I am sure of it. She told me she wouldn't marry you if you were the last man on earth."—Houston Post.

The Hired Man's Children

The "common question," to be discussed in the May Number of Woman and Home, is suggested by the following letter:

Would You Object to Children?

Why do most of farm employers who advertise for help always specify "No children wanted"? I am a hired man with a family of three little ones, and we get along well. I think my employers have no reason to object to children. I admit a child that is not properly brought up is something of a nuisance around a place; but where do the farmers expect to get their future help if not from the farms? Certainly not from the city. I would like to hear from both sides of the question, and I think it would interest a lot of your readers, as you must number a good many hired men among them.

R. B. OWEN.

Connecticut.

Eggs in Water Glass.

Please give recipe for preserving eggs with water glass. J. R.

Decay in eggs is caused by putrefactive germs entering through the pores of the shell. These germs are active in a warm temperature, but inert when the eggs are in cold storage. The object in using water glass is to seal these shell pores, and if the eggs are put into the solution before the germs have entered, they will keep many months—usually a year. A standard strength is one part water glass (sodium silicate) to nine parts of water, in a stone or wood—not metal—vessel; put the eggs in the solution when fresh and keep them covered with the liquid. Be careful not to break any, as this might spoil the whole lot.

These preserved eggs must be sold for what they are, not as new-laid. In many places the law covers this, and where it does not a man will be a law unto himself. Water glass eggs are not suitable for poaching, and like limed eggs the shells must be pricked before boiling to avoid cracking.

The suggested plan of dipping the eggs in a strong water glass solution will be only partially successful, depending on how thoroughly the pores are sealed.

Sweeping Compounds.

Can you give me the formula for making sweeping compound? W. C. P.

There are a great number of sweeping compounds mostly consisting of sand and sawdust with some oil, as rosin or tar oils, in fact, almost any oil that is thick enough and does not dry readily, yet is not sticky. Salt alone is considered good for this purpose and one of the best compounds consists of sand, sawdust, salt and paraffin. The proportions are five pounds of sawdust, three ounces of salt, about 2½ pounds of sand. Mix the above with an ounce of paraffin dissolved in a quart of paraffin oil. The oil may be heated in a double boiler, and you will find that the paraffin wax will readily dissolve. Still another compound for absorbing or preventing dust may be readily made by mixing three ounces of mineral sperm oil with 22 ounces of Portland cement and add a drop or two of mirbane oil. Mix and stir thoroughly until it becomes a granular mass rather than a paste. R. P. C.

R. N.-Y.—Some housekeepers soak old newspapers, tear them in bits and scatter before sweeping.

Selling by Sample.

Just before Easter we received a pretty little box containing one egg—fresh and large. It was a sample of what the sender could furnish during the year. Inside the box was a card with this little advertisement:

THIS EGG

was taken from a clean nest and should reach you in less than twenty-four hours from the time it was laid.

When you eat it you will know what a real, fresh, sanitary egg tastes like.

Eggs mailed the same day they are laid. Every egg guaranteed absolutely fresh.

For every stale egg you find in our shipment we will send you—FREE—one dozen fresh eggs.

Forty-five cents per dozen, postage prepaid.

As soon as we can plow and plant we will begin raising vegetables to send by mail.

FAIRHOLME FARM

The egg was neatly packed in soft colored paper, and the whole thing was very attractive. Hundreds of bright farmers' wives are at work studying out little schemes for advertising the goods they have for sale. Customers like these little attentions. They are part of the trade.

The Significance of the Sign

Prize Babies and Otherwise

"What did ye have good to eat, Sarah? That's what I want to hear about first," was Aunt Hannah's greeting to Sarah upon her return from the all-day meeting of the Ladies' Aid. Aunt Hannah was "bed-rid," and came in touch with the outer world only as her niece, Sarah, or occas'onal visitors brought it to her in fragments.

"Well, I s'pose I hadn't ought to say it, but I dunno as there was anything any better than the custard pie I carried myself. Miss Russell brought an awful good-tastin' chocolate cake, and Kate Porter's beans was good, but Viny Fuller brought the queerest mess—all kinds of vegetables, potatoes, beets, string beans, an' all like that together, with some lettuce at this time o' year, too, and then a kind o' cold, sour gravy on it. They called it a solid, but my land, I wouldn't touch it, if some of the other ladies did say it was fine."

"My country! And I s'pose y' had to eat with them silver knives. I never handled 'em but jnst onct. That was to Hack Hines' funeral, y' know. I said then I didn't blame folks for eating with their forks if they didn't hev nothing but them stiff silver knives to eat with. But go on and tell what happened."

After a few minutes of bustling about, putting away the various wraps which had shielded her from the chill of late Autumn, Sarah sat with her feet in the oven and reviewed the events of the day.

"V'iny Fuller's oldest girl was there with her baby. Y' know she's married and lives out West somewhere; in Ohio, I guess. It's a real pretty little feller, the baby is; but with all that girl's going to college, an' all like that, she don't know nothin' scarcely about raising children. Y' know, Viny always was proud feeling, and liked to show that she was a little stylisher and knowed more than other folks, but she got took down good to-day, and found that there was some things she don't know so much about as some other people. Gertie—that's her girl; I can't remember the name of the feller she married, they have such queer names out West—she set there next to me a-holding her baby on her lap, so I says to her, 'Y' ain't weaned him yet, hev ye?'

"'Oh, yes,' s' she, 'when he was 10 months old.' (He's jest a year old now.)

"'Y' did?' s' I. 'Didn't he make an awful fuss? He's so young,' I says.

"'Why, no,' s' she. 'He didn't give me any tronble at all.'

"And then Viny spoke up and sh' she: 'I never saw anything like it. Gertie just stopped nursing him one day and began feeding him with a spoon, and he never seemed to know the difference and never cried at all.'

"'Then you must 'a' done it when the sign was just right,' s' I.

"Gertie jnst smiled and didn't say nothing; but I had no idee she didn't know what I meant, but Inez Day says, 'Of course. Nobody couldn't wean a child without lots o' trouble if the sign wa'n't right.'

"Then Kate Porter says right ont to Gertie, 'Did you go by the sign?' and Gertie looked kinder queer, and s' she, 'I don't understand.' Well, then, I tell y' we all pitched into Viny sure enough. Kate Porter spoke ont plain, and s' she, 'W'y, Viny Fuller, do you mean to say that you let your daughter grow up and have a baby and wean it right in your own house and you never explained to her about the sign?'

"Viny laughed, and says, 'I didn't know that *anybody* believed in such outlandish foolishness these days.' Then, I tell y', Kate was kinder mad, and she says, 'W'y, Viny, I know it's so. I never knew it to fail. Hain't I took care of most of the babies and sick folks in this town for 30 years. I've seen it tried over and over again.'

"An' everybody else, 'most, said they knew it was so. Inez Day says, 'I guess I know it ain't foolishness. When sister Emma's second boy was 22 months old she started to wean him, but she just couldn't. He cried and acted so that he pretty near got down sick. She finally looked in the almanac, and found the sign wa'n't quite right, so she waited till he was two, and then she didn't have a mite o' trouble.'

"Mis' Boland hadn't said nothing, so somebody asked her if she didn't believe in it, and y' know how quiet and slow and pretty spoken she is. She says, 'Well, y' know, I ain't never had no experience myself, but I remember my husband use' to always be very partic'lar to see that

FIRST PRIZE AT BABY SHOW.

the sign was right before he would wean the calves.'

"Everybody told of some happening to prove that it was true, an' finally Gertie says, 'Will you please tell me how to know when the sign is right? I'd like to understand this thing.' So Kate told her about how the sign must be going down, and *it must be below the heart*, or there would be trouble; an' Miss Day told how it was the same in doctoring, and 'specially for any operation, no matter whether it was docking a lamb or cutting off a man's leg. I guess Viny felt pretty cheap. Anyway, she didn't say nothing; but Gertie says she was glad to learn about it, 'cause she hadn't known anything of it before. We all told her she must of just by accident happened to strike it when the sign was just right, an' how lucky it was. But, I declare, I must get the supper on now, and I'll tell you the rest while we're eating."

In Viny Fuller's little cottage at this same hour Gertrude was saying to her mother:

"Have you an almanac, mamma? I certainly must see this matter proved conclusively. Let's see if the sign was below the heart."

A few moments' search and a swift turning back and forth of pages; then: "You're all right, mamma. I began to feed him on the tenth, and on that day the sign was exactly *in the neck*."

GRACE TAFT STUTSMAN.

A Prize Baby.

James Kenneth Glennie, whose picture is shown on this page, is a prize baby. He took first prize in his class of babies of 36 months in the "Better Babies Contest," which was conducted by the Mothers' Club of Buffalo, N. Y. Contests for better babies are certainly as useful and ought to be a good deal more interesting than contests for calves, or colts, or vegetables or fruits. As a rule the baby who takes a gold medal in a prize contest is quite likely to take the leather medal in the great contest of life, unless his parents are hard-headed sensible people who realize the limitations of the baby contest, and its prize. It is not likely that James Glennie will have a case of enlargement of the head, as the result of his success. The Buffalo Express in speaking of him has the following:

The Scotch were in the lead, also the contest showed a high order of babies and was a triumphant commentary on the Scotch infant's sturdiness and health. This little man is almost a thoroughbred Scotchman, but of American birth, his father and maternal grandmother being of purely Scotch descent.

The Scotch people are shrewd and thrifty as a rule, and are not likely to forget that this prize merely starts the baby on the race of life, with a good chance to win out again later on. This boy is the son of Mr. and Mrs. Stanley Glennie, who are members of Niagara Grange. We wrote Mrs. Glennie asking her to tell us how she raised her boy so as to give him sturdy frame and health, and enable him to start the battle of life so well. Her sensible answer is printed below.

We are very glad to see that Mrs. Glennie has such sensible ideas in regard to feeding a child. It seems that this boy has lived upon grain and fruit very largely and with little if any meat thus far. We believe that is a sensible way of bringing up a child. Children will be better off all through their lives if they are kept from meat until their second teeth are well developed at least. We know that this idea is ridiculed or combated by some very good people. We have seen children less than two years old gnawing a ham bone, eating large pieces of meat, or consuming the thick pot liquor in which corned beef and cabbage had been boiled. We have watched the development of a good many such children and without exception they have developed into nervous, high-strung young people, never thoroughly strong, but always with physical defects in some vital organ. Prize babies are not produced on a meat diet, but Mrs. Glennie's way of feeding the child is far more sensible.

Raising the Prize Baby.

I am a farmer's wife with a scarcity of help, and two prize babies to look after, making no account of milk, cream, chickens, and ducks. As to how I raised that particular baby, I am almost at a loss what to say, but first we never woke him up. My mother always said that when he was sleeping he was growing, and he certainly did not belie the statement, for he was as vigorous at four months as many babies at eight. He got his food from nature's fountain and in no other shape until he was a year old; then his diet was strained rolled oat porridge, shredded wheat and milk. Later on he developed an appetite for mashed potatoes. He was never indulged in pastry, but instead had bread and butter and cooked fruit with milk. He always slept in his basket alone and had plenty of outdoors, but I think a strong factor in his make-up is his Scotch ancestry, for he is almost a thoroughbred; there being some Scotch blood on my father's side also. I might add that he had a great-great-great uncle who commanded a battery in the Civil War and died a few years ago at the advanced age of 97. This might also have acted as an invigorant. I think this is about all the information I can give that will furnish light on his condition, except that he is an outdoor boy; only a storm keeps him inside. MRS. STANLEY GLENNIE.

A MAN who had bought some currant buns at a bakery found a fly in one. Returning to the bakery, he made an indignant complaint, and demanded another bun in place of the inhabited one. "I'm sorry, sir," said the saleswoman, "I can't give you another bun, but if you will bring back the fly I will exchange it for a currant."—Credit Lost.

CBFR
LIGHTNING ROD

65 years proof of lightning protection!

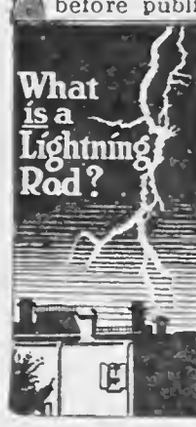
Positive protection is what your lightning rod investment should assure you. Lives cannot be replaced. You need protection—buy *the best* rod on its *record*.

Cole Bros. Franklin Rod

has been in continuous use for 65 years and not one penny's damage was ever done by lightning to any property on which the C B F R Rod was properly placed. It is the original Benjamin Franklin rod, perfected by the oldest, largest rod manufacturers in the world. Flimsy substitutes may cost a little less but they offer a whole lot less in wear and protection. Insist on the genuine C B F R rod.

Booklet Free!

Facts about lightning protection never before published; instructive, inside information you've long wanted. Here is a thoroughly reliable treatise on lightning and lightning rods written so anyone can understand it. 20 pages, 9 inches by 4, printed and profusely illustrated in two colors. Don't be in doubt; know what is truth and what is false about lightning rods. One copy free to property owners—extra copies 4c each. Write for our book today.



Cole Bros. Lightning Rod Co. 314 S. 7th St., St. Louis.

All The Water You Want

Fresh From the Well Without Storage

You can now have fresh running water in any part of your house, barn or feed lot without a water storage tank. All you need to do is to turn a faucet anywhere and the wonderful Perry Fresh Water Pump automatically starts working in well or cistern—giving you fresh, pure water, hot or cold, hard or soft, for kitchen, laundry, toilet, bath and watering stock.

Over 6 Years Old

Perry FRESH WATER System

Over 6000 Sold

This marvelous system brings the greatest of all city comforts—fresh running water—to farm homes. It is easily installed, simple and inexpensive to operate, very durable and requires no special building or change in location of well. See what users say.

::: NOTABLE PEOPLE :::

Pictures of Common Folk—Three Vermont Notables

By notable we mean worth noticing or talking about. The big people, out in the limelight, usually receive more attention than they deserve. They are sure

CLEORA ABBOTT—PRIZE HEN WOMAN.

to be advertised. We seek the humbler individuals who do worthy things in smaller places, and are often passed by in the hurrying throng. This month there are three—as it happens all from Vermont, a State noted for its fine women and active old people. The two girls, Cleora Abbott and Marion Pilkington, belong to the Windsor County Boys' and Girls' Poultry Club. This was organized by the County Y. M. C. A., and contains 69 members, averaging 14 years of age—29 girls and 40 boys. Each member took a setting of 15 eggs of any desired breed—these eggs to be hatched and raised by a hen. Full records were kept of work, care, feed expense and similar items—each record certified by an adult. Cleora Abbott, age 15 years, won the highest honors. She hatched 15 chicks from 15 eggs. Up to January 1 the pullets out of these 15 chicks laid 113 eggs—a clear profit on the original 15 of about $12. Miss Clara won a 70-egg incubator and a pen of White Wyandottes worth $25.

Marion Pilkington is 13 years old. We see her in the picture with some of her R. I. Reds. She also obtained 15 chicks from 15 eggs through the help of her faithful friend—the hen. At the end of four months all these chicks were living. She won first prize for largest total weight of chicks—62 pounds—and won as prizes an incubator and a brooder. It is not likely that either one of these devices will equal the original old hen. It is hoped to develop this organization of young people into a coöperative egg-selling club. We tried to get these girls to tell just how they managed the eggs and chicks, but there is too much instinct in the thing of hatching 15 chicks from 15 eggs, and who can communicate instinct? At any rate Cleora and Marion are worthy to go into our list of notable people who set us all an example in doing humble things well.

And now what have you to say to A. P. Jones of Brandon, Vermont, who is shown climbing a telephone pole on his 80th birthday, and showing the boys how to do it? You see these people up in the "Bashful State" start early at doing good-sized things, and keep it up late. Some of these boys of 50 to 60 would have a dizzy head before they got 10 feet up that pole, but here is Brother Jones climbing it like a fly. Here is a brief story of his life:

I was born in Lincoln, Vt., in 1832; went to Fond du Lac, Wis., in 1854, was engineer on stationary, railroad locomotive, and steamboat. I was engineer on the Mississippi River when the Civil War broke out. I left Pittsburgh for New Orleans November 6, 1860, on steamer Bellwood, then returned to Fond du Lac and ran one engine in railroad shop for 12 years. I was also lineman for 10 years on railroad and telephone. I returned to Vermont 25 years ago, carried on a market garden for a few years, since which time I have been just a farmer. For the past few years I have not been able to do the heaviest part of the work, but take care of cows, horses and hens, and saw wood. I have never been sick to speak of; I think that my being temperate, using neither whiskey nor tobacco, is the reason for my good health.

A. P. JONES.

Opportunity and Woman.

At a recent public dinner in New York, Dr. Katherine B. Davis, Commissioner of Correction, remarked that she wished she had a husband, so that he could attend banquets for her when she was too busy to go herself. The Governor, the mayor or the district attorney, could send their wives, but she, an efficient spinster, had no one to protect her from the social obligations that eat up so much of a busy person's time. For a good many centuries men have been attending the banquets of life, while the women stayed in the cave, or the hut, or the castle, attending to the business of being a woman. During all these centuries, while the home was the industrial center, the women did just such work as they are doing today; they manufactured the food, they wove and made up the clothing; they cared for infancy and helpless age, and nursed the sick. When all these occupations became specialized and commercially profitable, men took them out of the home, reminding the women, however, that it was their duty to stay behind.

MARION PILKINGTON AND HER HENS.

Now we see women taking up all their old occupations again, in the outside world to which they have gone. Perhaps we can blame Elias Howe for some of our modern feminine unrest; without the sewing machine our feminine population would have been kept so busy hemming their frills that they would never have had time to become, like Dr. Davis, a full-fledged penologist with a doctor's degree. But we are not worrying, as some very good people do, over the changing attitude of women towards life. More than a hundred and fifty years ago Lady Mary Wortley Montagu remarked that she had traveled widely and seen much of the world, but she had only found two kinds of people in it, men and women, and they were very much alike. Modern conditions seem to bring out the wisdom of Lady Mary's remark. Through all history, Opportunity has ever found the man ready for it, and now we are giving our old friend Opportunity a chance to find the woman too. It is just as well to remember however, that all the opportunities seeking the right woman, are not roaming around the outside world. Some of the biggest and best opportunities that ever escaped their seekers have been grasped by hands callous from the broomhandle, or encumbered with a worn old thimble.

The Baked-bean Center Moving.

Who would have thought that the baked-bean center of this country was ever in danger of moving away from New England? Who would have thought, if it ever did go, it was likely to jump straight across the country and locate upon the desert? Yet if we are to believe the bean authorities at the Arizona Experiment Station, this is likely to follow. Listen to them as they step upon the house-tops and proclaim themselves prophets.

It is the year 1917. A lady is shopping in a large city grocery store. "Have you any canned baked beans?" she asks the salesman. "The best made, and two cents cheaper, too," he replies, producing a can. The striking label on the can catches the lady's eye immediately, and she takes it for a closer examination. "Arizona baked beans," she reads over a picturesque lithograph of an Indian dressed in full regalia. "Grown by the Papago Indians in Arizona for hundreds of years—a real American product." "This isn't the old Boston brand that I have been buying, but I will try it," she says. Two days later she orders a dozen cans.

This prediction is made by Prof. G. S. Freeman, the plant breeder who says that people do not realize the full value of the Tepary bean. It is a dry land bean, quite hard, and requires an extra time for cooking. Prof. Freeman claims that a given weight of Tepary beans will produce 40% more cooked beans than the ordinary kind which has been famed in song and story. It is equal in food value to other sorts of beans; a little higher in fact in the fats and oils. The Arizona people actually think that within a few years these beans put into cans will take care of the Western trade, and that the more they are eaten, the greater will be the demand for them.

No, Burbank seems to have nothing to do with the production of this bean. The Indians consumed it hundreds of years ago, even before the Pilgrim Fathers struck New England and began to eat baked beans and succotash. Surely the old times and the old traditions are crumbling all about us when Arizona comes forward well matched to fight New England for supremacy on the baked-bean question.

Back-to-the-Landers.

A number of interesting stories could be told about the "back-to-the-land" problem. We get many of them here, and all sides are certainly represented. In one case which has just come to our knowledge, a man and his wife left the city, bought a small farm in Southern New Jersey, and started in to try to pay for it. As usually happens, the money ran dry, for most "back-to-the-landers" do not realize what it means to get into a situation where the pay envelope does not come along every Saturday night. These people, however, were determined to own their farm, so the man left his wife to hold the place as best she could, and he enlisted in the army and went to the Philippines for several years. He sent his money back, and his wife used it wisely on the farm until it was paid for. Then he came back to improve the place and make his home. The children had grown up, and several of them wanted to go to town. They thought they would find a better opportunity there in a town business. This man finally gave way, sold his farm, and invested the money in a town business, only to lose it all, and to find that his boys were after all dissatisfied. They would not go back to the country with him, but the man and wife have made another trial, and are back on the land again. The man is still working in the town, going to his place to spend Sundays. His wages are going into the farm, and in the course of time he and his wife will have the place paid for again, and when they complete this "second struggle," he says, that no one can induce him to sell his home again.

In another case a man and his wife had a fine fruit farm, well stocked and well paying. They took their family to college for education and rented this fine farm to a back-to-the-lander family. This family took the place—the man stayed at his job for a while and put the money into the farm. They apparently worked hard, yet even with this fine place, on which the former owner made money, they have not been able to pay half their rent!

In another case two "back-to-the-landers," man and wife, left New York to establish a fruit and poultry farm in the country. They too ran upon the hard problem of lack of capital. They used up their ready money in two bad seasons before the farm was paid for, and before their hens and their fruit could give them much of an income. The man was unable to obtain his old job in the city. His wife was an expert stenographer, and she went back to her old place. The man stayed at home to keep house and work on the farm, because he felt that while he couldn't keep house as well as his wife could, he could work harder, as his strength was greater. The woman traveled back and forth some 60 miles a day, Summer and Winter, earning her salary and paying this cash in against her husband's labor. In a year or two they had the farm paid for, and the hens and the fruit are now doing well. These "back-to-the-landers" can look back upon their hard days with a smile. They would not sell their home, and it will grow more valuable with each year, and yet they understand only too well the absolute need of working capital to make such a place go. In another case a man and his wife, of middle years, bought a small place outside of the great city. They were wise enough to see after a little experience that it would take them several years to adapt themselves to farming or gardening, so that it would pay. Their farm was not paid for, and so both man and woman held their jobs in the city, and go and come every day, earning their salary as before, and hiring a housekeeper to take care of the place. In a year or two they will have the place paid for, with working capital, and some of their trees in bearing. Then they can take hold of the poultry business and develop it as they need.

"SHOWING US HOW" AT 80 YEARS.

Care of the Eyes

From Cradle to "Old Sight"

By Jos. E. Sternberg, M.D.

The subject is one of vital importance to all mankind. As you should all know, the eye is one of the most important and delicate organs in the body. You will then agree with me in the fact that the necessity of perfect sight is not only essential to our happiness, but necessary for our success in life.

INFANTILE CARE.—The care of the eyes must begin at birth. Statistics show that more than one-third of all those suffering from loss of sight, whether in our hospitals, institutions, or at large to-day, can trace their affliction to neiglect of their eyes at the time of their birth, either through lack of knowledge or cleanliness on the part of the attendants at that time. No physician or attendant has discharged his duty or obligation to State, mother or child, who has neglected to employ the necessary prophylactic measures. The family is, and should always be, instructed by their family physician in the proper hygienic care of the eyes. When these instructions are not given, it is safe for the mother to do this herself, washing both eyes morning and night with a solution of boric acid, which is made as follows: Get about 10 cents worth of pure boric acid (not kitchen borax), take half a teaspoon of the powder, and dissolve it in half a pint of hot water. When thoroughly dissolved it is ready for use (should always be used lukewarm). Before using the solution be sure to thoroughly cleanse your hands with soap and water. Tear off a bit of clean absorbent cotton, dip it in the solution, and wash both eyes, allowing the solution to get into the eyes, or a medicine dropper may be used, which should be boiled before using. What is left of the solution should be tightly corked in a clean bottle until needed again.

CONDITIONS IN CHILDHOOD.—Passing to childhood, the most common conditions we find are those of defective vision and cross eyes. In defective vision the child usually complains of headaches, holds its book too close to its face, the eyes water, tire easily, and there is a feeling of general discomfort. Never make light of such complaints. Children do have headache and stomachache when they believe it to be to their advantage as an excuse for not attending school, with a remarkable recovery by half-past nine, but many a child is considered wayward and backward at home and in school, when a proper examination would at once reveal the true cause. Statistics show that 10 per cent of all headaches are due to faulty muscle action, and 75 per cent to eye strain.

CROSS EYES—This trouble may be noticed during infancy or in childhood. As a rule this condition occurs early in life. Here much can be done when attended to early. Do not allow the child to go on, hoping the eyes may come straight. They seldom do; if not attended to, the turned eye is apt to become blind from disuse. Treatment for defective and cross eyes consists of a careful examination by a physician or oculist trained for this work, who will use the necessary methods to relax the child's eyes, find the true and exact condition, and prescribe the proper glasses. No child is too young to wear glasses if needed. I have on several occasions prescribed glasses for children aged as young as 18 months, with excellent results in defective vision and cross eyes.

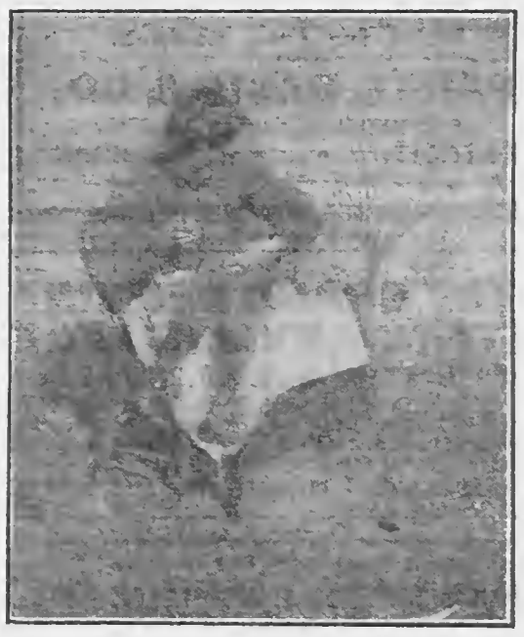
Taking into consideration the abuses during school life it is essential that proper examinations be made by the teachers and parents at the very beginning, examining each eye separately, covering one while the other is being examined. This examination will show any deficiency. In cases of cross eyes, when wearing glasses does not help after a reasonable time, operation is the only means of overcoming the difficulty. You owe it to your child. When this is denied the child, who will be responsible when the child reaches adult life?

It should be the duty of parents to visit the school in order to observe the arangement of desks, light and sanitary conditions; where the parents will cooperate with the school, defects are quickly remedied. Following school life, various occupations carry with them a number of accidents, the most common of which are burns, foreign bodies in the eyes, and inflammatory conditions. Burns are always serious. If from acids neutralize and wash out thoroughly with bicarbonate, cooking soda, or a borax solution. If from lime use a strong solution of sugar water, olive oil, milk, or a weak solution of vinegar. *Never use*

A FUTURE R. N.-Y. SUBSCRIBER. NO FEAR OF THE DOG HERE.

water alone in a lime burn. Blows, as a rule, cause hemorrhage under the skin (commonly known as black eye). This condition as a rule clears up without any treatment in about a week. In the early stage, however, cold compresses may help, while later hot compresses will hasten absorption. A solution of arnica is very beneficial applied hot or cold.

Foreign bodies most frequently lodge and can be found under the upper eyelid; they are easily removed by the following method. Have person look down, grasp eyelashes, draw lid down and away from the eyeball; then with a toothpick, match, or pencil turn lid up over it, when it is easily removed. If the foreign body is seen on the eyeball, do not rub it, as this will tend to embed it. Use a bit of absorbent cotton on a tooth-



LAID UP FOR REPAIRS.

pick, or a clean handkerchief, and quickly wipe it off. *Do not* under any circstances use *eyestones* or an unclean handkerchief, nor *poultice an eye.* If it is a small piece of steel use a small magnet. Should you fail to remove it see your physician at once.

INFLAMMATORY CONDITIONS.—These always mean a condition which, unless thoroughly understood, should not receive home treatment, as they often mean the loss of sight. Pink eye is a contagious disease, and is most prevalent in the Spring and Fall. The discharge is contagious; it is spread by unclean towels, handkerchiefs, and after washing in the basin of an infected person. If this occurs in school the child should be sent home at once, and not allowed to return until a certificate is had from the attending physician. It is not safe to attempt home treatment in this condition, as it is not in the danger of the condition itself, but in the possible complications which may arise. Consult your physician at once, or better still, your oculist.

OLD SIGHT.—Arriving at the age of 40, a change takes place in most eyes, commonly known as old sight. This change is a natural one. The first thing noticed is, while reading a person holds the book too far from the eyes (normal distance is about 14 inches from the eyes). At this time it is advisable to consult your oculist at once, who will prescribe the proper glasses. Do not go into the village store or to the peddler and pick out a pair of glasses. You may think you are getting them cheap; later you may regret it. Glasses purchased from peddlers and general stores are likely to result in improper fitting, causing much trouble difficult to eradicate later.

In conclusion it will be well to consider what defective sight means, what are the chance later in life. It reduces the value of the individual; partial loss of sight reduces the earning power in proportion to the degree, while complete loss of sight removes him from the wage-earners to the classes of dependents. Treat your eyes well; they are your best friends.

Sewage Disposal and Sewing.

Here are two pamphlets which should interest all country women. First is Bulletin 57, issued by the U. S. Department of Agriculture, at Washington. This discusses "Water Supply, Plumbing and Sewage Disposal for Country Homes." It is full of pictures and discusses this big water question in a practical way. This question is how to get the water into the farm house, how it may circulate as needed and then pass harmlessly out. Your home cannot be right until this question is settled. This free pamphlet helps settle it. The other is "Sewing, Darning and Patching," by Miss Della Hughes, issued by the Ontario Agricultural Department at Toronto, Ont. Miss Hughes is probably guessing at it, but her guess as to how thread and weaving originated is as close as we can get it:

While furs were still man's only clothing he discovered the use of fire. In absence of matches, the starting of the fire was a difficult problem, so it fell to a woman's lot to remain at home, to keep a perpetual fire, while man hunted for food. True to a woman's nature, she made use of her time, trying to keep her surroundings neat and tidy. She discovered that the reeds used for the floor covering stayed in place better if entwined. This was the origin of weaving. Long reeds were placed side by side on the ground corresponding to the warp thread of our modern textiles. In and out these were woven reeds not so strong, corresponding to our woof threads. Basketry of various kinds developed from this form of weaving, but no great improvement could be made until the advent of other fibres which were the result of the spinning industry. Spinning probably began by twisting fibres, hairs, grasses and sinews, or by rolling them between the thumb and fingers. Then it was found better to roll them between the palms of the hand, and later between the palms of the hand and the naked thigh. Yet in these rude methods we have the foundation of the spinning wheel and the steam-driven cotton spindle. When the primitive woman started to use goats' hair or wool, she fastened strands of it to a stone, twirling it around until the yarn was twisted as desired, after which it was wound around the stone and the process repeated. Some time after this the spindle came into use, then the whorl, then the distaff.

The work of sewing, darning and patching is taken up in detail. It is of course impossible to teach such things entirely through print, but these pictures and descriptions will interest all needlewomen.

TED Brown, an American, was touring Scotland and one afternoon mounted a high hill in company with a Scot who began bragging of the extensive view. "I suppose you can see America from here on a fine day," said the American, jocosely. "Oh, aye, farther than that," replied the other. "Farther than that?" "Aye! On a fine nicht we can see the mune."—Credit Lost.

HOME COMFORT

A Good Percolator is a necessity in every household. We will send you the percolator described below, delivery charges prepaid for

Three (3) New Yearly Subscriptions or Six (6) Renewal Subscriptions

(One of these may be a renewal of your own subscription.)

Percolation is the automatic process of pumping hot water up the tube and over the coffee grounds extracting only the good of the coffee, leaving the coffee free from any muddiness or bitter taste—a perfectly clear, delicious, full strength beverage, wholesome and always uniform. This Seven-Cup percolator is made of the best grade Lake copper, handsomely nickel plated; aluminum basket; rosewood handle—handsome pattern. The percolator is of simple construction; no complicated mechanism to get out of order; easy to operate; easy to clean; absolutely sanitary.

The percolator "pays for itself in the coffee it saves." The retail price of this percolator is three dollars.

If your neighbors are not subscribers to the Rural New-Yorker, get their subscriptions. If they are subscribers, get their renewal.

Rural New-Yorker, 333 West 30th St., New York.

Live Stock and Dairy

PORK PRODUCTION FOR THE EAST.

How to Make Hogs Pay.

PART I.

A GOOD OPPORTUNITY.—Pork production affords unusual opportunities to the Eastern farmer, in view of the fact that available unexcelled markets for all classes of pork products prevail. In addition to the wants of the exacting population within any given area, the manufacturing industries utilize the services of foreigners and laborers who particularly relish fresh pork products, and willingly buy pork in any form. The Eastern farmer is interested in supplying this market, and it is essential that he know definitely and accurately the practices necessary for successful feeding, breeding and management of the swine herd. In the extensive trucking and market gardening districts of the East, there is annually wasted a vast amount of unmarketable products that might be used to advantage in feeding swine. In any dairy district swine serve as a means of utilizing the by-products, and make the

BROOD SOWS ENJOYING ALFALFA HAY.

salable products more concentrated and of greater value. In any section where corn and Alfalfa can be grown successfully, and where other forage crops produce average yields, the keeping of pigs would be a source of profit. The advantage of this phase of live stock farming might be briefly summarized as follows:

1. The initial investment is small as compared with other lines of live stock farming.
2. It is easy to "get in" or "get out" of the swine business.
3. Requires small expenditure for labor and is less exacting and confining than dairying or garden farming.
4. Enables utilization of farm, kitchen, orchard, garden, seed, mill and other waste products, without subjecting them to expensive methods of preparation.
5. Breeding animals are prolific (deliver large litters) thus enabling rapid and steady improvement by selection and systematic mating.
6. The animals mature at an early age; require short growing and fattening periods; can be readily marketed at any age or weight.
7. Necessary colony houses, fences and equipment can be provided at small cost without need of expensive labor.
8. Manure voided worth $3.50 per ton. Rooting improves clay soils and soddy orchards; while pigs scavenger and work over coarse barnyard manure and improve its texture and content.
9. There exists steady demand for meat or lard products; meats may be cured or placed in cold storage; the product is not perishable as is milk, vegetables, etc.
10. Establishes a market for home grown feeds, thus gives the farmer the grower's and feeder's profit.
11. It is much easier and far more economical to market a ton of pork than five tons of corn, its equivalent. The voidings add to the profit by maintaining soil fertility.
12. Swine in the barnyard make dairying or beef production more profitable, and the industry serves as either a side line or may engage extensive development.

Of course, there are certain limiting factors in reference to pork production that should be considered, and they may be stated as follows:

1. Losses sustained from cholera, parasites and pests.
2. The attention given sows at farrowing time is important, as is the raising of large litters, and keeping the youngsters growing steadily from birth to maturity are essential for success and profit.
3. Unless free range, green forage and home grown products, rather than purchased feeds are utilized, gains will be expensive and of questionable profit.
4. Losses will be entailed unless cool shady retreats are at hand during the Summer season, and dry protected quarters furnished during the Winter months.
5. Type and breeding of animals selected: Common grades, or scrubs develop slowly; require long fattening periods; the net gains are expensive; while their carcasses do not evidence extensive fleshing in regions of valuable cuts, hack, loin, hams and ribs; when comparison is made with purebreds or selected grades.

If reasonable care and judgment are exercised in the management of the herd, and modern practices in reference to sanitation are employed, there will be little danger of loss from disease or other causes. The factors that limit profits are: prolificacy, weight for age, quality, type, vigor and the use of young animals.

CHOOSING THE BREED.—Two distinct market types of swine prevail, namely, the fat, or lard hog and the bacon hog. Representative breeds have been developed, especially adapted for the production of specimens to supply specific market demands, and while these vary in color, size, prolificacy and age of maturity, selected individuals may be found in each of the breeds which have very little, if any difference in their ability of economically producing one hundred pounds of pork. A far greater problem for the swine grower is to make careful and systematic selection of individuals within any given breed, hence the choosing of the breed is of relatively small consequence. The leading fat breeds are represented by the Duroc Jersey, Chester White, Berkshire, Poland China and Small Yorkshire; while the foremost bacon breeds are identified as the Large Yorkshire and Tamworth. It is fundamental that the breeder determine first the particular kind of meat products that are in greatest demand at the available markets, then his personal preferences as to breed characteristics such as size, color, form, type, fattening and maturing qualities, should determine the breed to be selected.

THE FAT HOG.—For New Jersey conditions and markets the fat hog is the utility and popular type. In fact buyers offer no more per pound for marbled carcasses of bacon hogs than for a prime representative of one of the fat breeds, provided of course, both specimens are within the desired range of weight; the preference being for a carcass weighing from 175 to 200 pounds. It is common knowledge that representatives of the fat hog type reach such weights in a shorter period, that they are better adapted to pen feeding, and consequently more economical for converting farm products into meat, while the bacon hogs must have long growing and slow feeding periods, and require dairy by-products if the choicest fat-and-lean carcasses are to result. It is generally conceded that it requires more skill and a greater knowledge of feeding to grow and finish prime representatives of the bacon hog than is necessary with fat hogs.

THE BROOD SOW.—The brood sow is the unit of pork production. Regardless of breed or type she should have certain definite characteristics representing a happy combination of evident breeding and individual excellence. If it is desired to produce and sell animals for breeding purposes, the score card as established by the various registry associations should be studied, and care exercised toward selecting and developing that type of animal that is

held in the highest regard by the foremost breeders and judges. Utility from a butcher's block standpoint should measure every item upon which market selection is based, for ability to put on prime weight with quality makes the difference between profit and loss with swine. The purchase of bred sows is perhaps the easiest way to start in the swine business, and owing to the rapid rate of increase, the desired number of breeding animals can soon be established. In choosing such a sow for breeding purposes, the following points are of importance:

1. She should be purebred, well grown and developed by a reliable breeder, and registered in a record association in good standing.

2. She should trace to a large even litter, farrowed by a kindly disposed heavy milking dam that evidenced good size, vigor, quality and fleshing characteristics. The pedigree should show in short tabulation family performance and popular breeding.

3. She should evidence good weight for age; possess a clean shapely head, large bright eyes, heavy well set jaws, light neat jowl, trim ears with a short smooth neck. She should possess, if in good condition, a long, straight, broad back, smooth compact shoulders, deep well arched sides with even width throughout. The hams should be plump and shapely. The underline should be trim and dotted with many evenly placed rudimentaries. The legs should be straight and strong with clean dense bone, and the pasterns well supported. From every viewpoint she should evidence style, finish and symmetry.

4. Quality, as evidenced by the fine silky coat of hair, refined head and shoulder, clean fine bone and trim belly determines dressing percentage. Avoid selecting highly conditioned show animals for breeding purposes, as very often they prove unable to reproduce in satisfactory numbers with any degree of regularity.

5. The use of serum and virus has revolutionized the treatment for prevention against cholera, and if convenient to obtain immune foundation stock initial losses and disappointments will be lessened. F. C. MINKLER.

Live Stock Sales Establish Values.

"You do not realize the value of a good purebred cow; the maximum price paid for a well-bred producer is yet years away." This was the declaration of a well-known breeder at a live stock sale which I attended. Many believe we are near the limit of high prices. The dairy world has been interested in the $10,000 dairy cows, but it will be no surprise, some breeders believe within two of three decades, to see $25,000 and possibly a $50,000 dairy cow. I have at hand some interesting data regarding Short-horns. This breed had its innings in the latter part of the seventeenth century, when Virginia led with several minor importations. The Short-horn interest revived following the Civil War and the climax seemed to have occurred with the New York Mills sale in 1873. At this auction 109 head were sold in three hours. The footings of this sale totaled $380,000. One cow sold for $40,600, another $35,000, six others averaged $24,000 and eight others averaged $14,000 each. British breeders agreed that America was producing better Short-horns than in England, and came to the sale to take back the cream of the stock at any price. They had to pay for them to get them.

It is the opinion of many hard-headed business breeders that well advertised sales are grading up the price of purebred cattle. With the business ability, the publicity and increasing interest in the breeds, the man who wishes to get in good purebreds must do so at once, for prices are after altitude records. W. J.

MEETING OF GUERNSEY CATTLE CLUB. The annual meeting of the American Guernsey Cattle Club will be held at Hotel Imperial, Broadway and 32d Sts., New York City, May 13, at 10:30 a. m. Besides the regular business of hearing the reports of the year's work, the election of officers, etc., the question of changing the by-laws so as to surround the matter of transfers with greater safeguards will be presented. Opportunity will be given for consideration of matters relating to the welfare of the club and its work.

DAIRY CATTLE

In Service at Meridale Farms

Prince Jonquil 85334

is a worthy son of one of America's foremost dairy cows. His dam, *Springfield Owl's Era 123934*, a Meridale Jersey, in a year's work ending February 28, 1914, produced 16,457 lbs. milk, 1,168 lbs. butter, with an average fat test of 6.035%. The world's record is 1,175 lbs. Two previous yearly records attest her consistency in dairy work, while a daughter and practically a full sister in the Register of Merit further evidence that dairy quality runs in the blood.

His sire, *Interested Prince 58221* (Imported), has 25 daughters in the Register of Merit, with yields as high as 13,833 lbs. milk, 819 lbs. butter on yearly test. Thirteen daughters of Interested Prince and fifteen daughters of Springfield Owl in the Meridale herd are demonstrating to us every day the remarkable productive quality of the blood lines carried by Prince Jonquil.

We are breeding to him some heifers of exceptional promise. A few of them will be sold. For particulars address

THE RURAL NEW-YORKER, 333 W. 30th St., New York

RAISING STOCK CALVES.

Since the silo is coming into general use, and beef cattle are scarce and high-priced, the cost of raising beef calves becomes ever more important to farmers of the Eastern States. Therefore we would like to give some figures showing the profit from a small herd of beef cows and compare them with dairy cattle as sources of profit and consumers of high-priced feed.

Of 14 head of two-year-old heifers, three of them failing to breed, the following figures show the profit from letting 11 head raise their own calves. The three barren heifers, costing six cents per pound in the Spring, with an average weight of 1,030 pounds, makes them cost $61.80 apiece or $185.40 for the three; and after gaining 150 pounds apiece and selling at seven cents per pound, or $247.80, return a profit of $11.44 apiece counting $22.50 for six months pasture and $5.56 interest for the three head. The figures for the 11 head of young cows is as follows:

COST.

Weight 1,030 at 6 cents per lb., for 11 head	$679.80

FEED FOR 18 MONTHS.

Pasture 6 mo. at $1.25 for 11 head	$75.00
Silage 50 lbs. per day, 210 days for 11 head at $4 per ton	231.00
Cottonseed meal 1 lb. for 210 days at 2 cents per lb. for 11 head	46.20
Pasture 5 mo. the second year	68.75
Interest 18 mo. at 6%	61.18
Pasture for 11 calves 4 mo. at 25 cents	11.00
Bull service	33.00
Barn rent and equipment	55.00
Cost of keeping cows and calves	$581.13

No charge is here made for care of bedding, and no credit for manure, which is usually given at $15 per year; $4 per ton for silage yields sufficient profit under ordinary circumstances so that the profit pays for marketing it to the stock.

SELLING PRICE OF COWS.

Increase in live weight of 270 lbs. per cow. Total average weight 1,300 lbs. at 7 cents, $91.00; 11 head of cows at $91.00 per head		$1,001.00
Average weight of calves 610 lbs. at 6 mo. selling at 7 cents $42.70 apiece and for 11 calves		469.70
Selling price of 22 head		$1,470.70
Cost of heifers	$679.80	
Cost of keeping cows and calves	581.13	1,260.93
Profit from cows and calves		$209.77
Profit from 3 heifers		34.34
Total profit		$244.11
Profit derived from keeping a beef cow 18 months and allowing her to raise her own calf		$19.07

After noting these figures is it not plain to anyone that where land is cheap and pasturing stock is profitable, and where silos are used for wintering cows, the production of beef cattle is profitable, with not near so much work necessary as in running a dairy? The bother of careful breeding to keep up a high average milk production is eliminated.

Ohio. H. B. C.

Women and Silos.

In reply to the woman farmer of Illinois, will say that I have many times gone up in our silo and pitched out silage when business matters prevented my husband from getting home at feeding time, and while it is not an easy task it is not as hard work as pitching hay out of the mow. The silage settles after filling, so it is seldom necessary to climb to the top. There should be a stationary ladder in the chute. For a small dairy it would not be necessary to have a silo 40 feet high. Ours is 30 feet, and we winter not less than 20 head of stock. Where only a few cows are kept I do not think I would build a silo, as it is quite an expense to fill one and if not fed enough to remove a layer from the top every day it will not keep well. I consider it quite necessary for a farmer's wife to understand how to care for stock.

New York. MRS. J. S.

As for a woman getting silage out of a tall silo, it is one of my daily tasks, and is not difficult after a little practice. Wear a common sense skirt and climb in same as any one. A man does not scale the bare wall. B.

West Virginia.

In regard to the woman farmer and the high silo I can see no objection as long as the woman dresses for the work. Strong broad-heeled shoes, denim overalls, and a snug-fitting jacket or jumper will make the silo as accessible to her as is her flour in her kitchen cabinet. Skirts should never be worn around animals or around the buildings where animals are kept. They are cumbersome, unsafe, unsanitary, and immodest. They interfere with the free movement of the wearer, render her liable to accidents, gather and scatter filth, and are continually putting her in unseeming and unpleasant circumstances. I am a farmer and a farmer's boy, and I think I express the thoughts of the thinking farmers and farmer's boys when I write as I have. W. F. F.

You ask for more particulars about the silo that a woman empties. It is built in a corner of the barn, the barn floor being at one side and the opening for doors being in the center of that side. The hay mow is on one side, the other sides being the barn covering. Of course there are lining boards and the bottom is cemented. The door opening is built up with two sets of boards, which are nailed enough to hold them and taken out as the silage is fed. Against the side of the silo, between the haymow and the silo doors, is a permanent ladder or series of steps consisting of the barn girths and strips nailed between. There is also a movable ladder of suitable length in the barn usually, that can be used if necessary. Since the silage has been cut, the tools used are a rake, fork, basket and as many bags as there are head of stock to feed. The desired quantity of silage is put in the bags, which are then dropped to the barn floor, so only one trip has to be made to the silo. When the stalks were fed whole, they were thrown to the floor and then gathered up. The silo is 8x12 and 14 feet high, and when full will hold enough to feed three or four head once a day for six or eight months. Of course it is work to feed silage, but I don't know that it is any harder than several other things that have to be done on a farm. B. E.

Brown Swiss are Valuable.

I notice an inquiry from J. A., Middletown, N. J., regarding the advisability of purchasing a Brown Swiss heifer, answered by F. C. M. in a manner rather reflecting on this breed as compared with the other recognized dairy breeds, especially with regard to milk production and udder development. Under separate cover I am sending you a pamphlet containing the cuts and records of some of a herd in Illinois which I had under my supervision for about twenty years. On pages 11, 12, is a group of seven cows taken from the milking herd that I think show udder development that would be a credit to any breed. On pages 19, 20, is a list of 31 from that herd that in 1909 gave 307,641.8 pounds of milk, or practically 10,000 pounds apiece, average per year. Seventy-three of them gave over 400 pounds of butterfat, and three gave over 500 pounds of butterfat. These cattle were not forced for records and were out every day in the year.

The Brown Swiss Association started a registry for production a little over a year ago, and the results have been a surprise even to the breeders themselves. The average for production has been higher for the cows that have entered than of any of the other breeds to date and practically every cow that has entered thus far has qualified. One cow from the Michigan Agricultural College has made over 19,000 pounds of milk and 100 pounds of butter. From my own experience with these cattle I believe the average of production will rank as high as, if not higher, than any other dairy breed, and have recently started a herd on my own account. In Hoards' Dairyman you will find the record of a sale of Brown Swiss at Darlington, Wis., a State where the cattle are better known than any other section of the country. The herd consisted of five males and 22 females, 10 were calves under one year old. The herd was sold by a farmer to 14 other farmers at an average price of over $208 apiece; the highest price was $400. W. E. J.

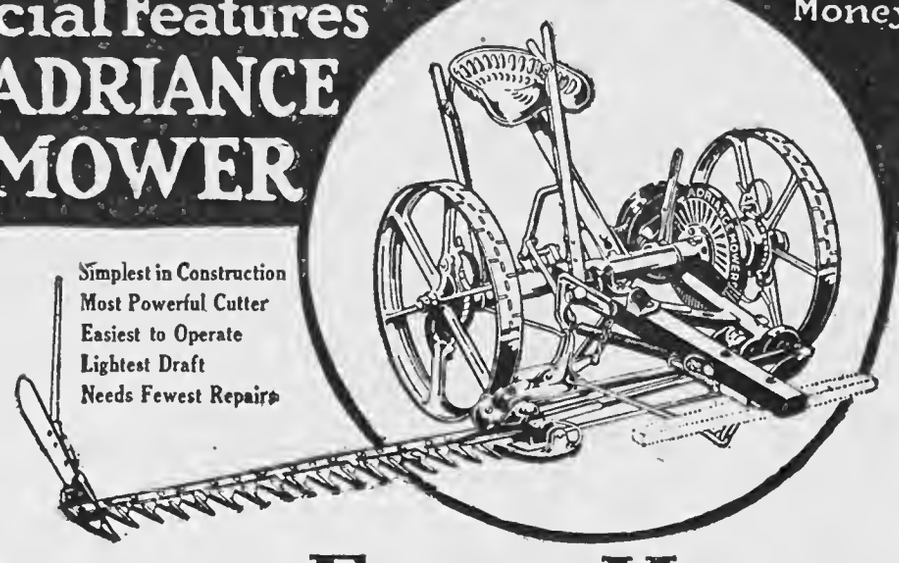
Charlotte, N. Y.

ANOTHER PROLIFIC SOW.—After reading record of prolific sow on page 193, as farrowing 13, 12, and 13 pigs in her last three litters, I am tempted to tell of mine. She is a grade Chester four years old this Spring. Last Spring she farrowed 16, last fall 19, and on January 30 last 17. O. A. R.

Thomaston, Me.

Examine the many Special Features of the ADRIANCE MOWER

Saves Time Horses and Money



Simplest in Construction
Most Powerful Cutter
Easiest to Operate
Lightest Draft
Needs Fewest Repairs

"Simplest—Easiest Managed —Most Durable"

The Verdict of the User—Read These Letters

I have an Adriance Mower that has been run for 30 years. It cut 25 acres the past season and is still in good shape. It runs easy and cuts grass no matter how heavy. E. V. Link. Shepherdstown, W. Va.

I have used the Adriance Mower made at Poughkeepsie, N. Y. for the last 19 years and consider the No. 8 Adriance, the simplest, easiest managed and most durable machine I have ever seen, and I have used several makes. Harrison Philbrick. Rich Hill, Mo.

The Adriance Mower Will Save You Money

Haying season is short and every hour is worth gold dollars. If your mower is old or not wholly reliable, don't trust it and have it "lay down" right in the midst of the busy haying season.

The one mower that gives faultless service, every hour of the day, year after year, is the **Adriance.**

No other mower is so simple in construction; no other mower is so well made—no other mower has the record of so many years of hard service with so little expense for repairs.

Flexible Cutter Bar—The **Adriance** Cutter Bar follows uneven land. The coupling frame hinges are in exact line and swing like a door—no binding. The bar can be folded over the tongue when not in use.

Knife Starts Instantly—The clutch is on the high speed shaft—thus starting the knife instantly and avoiding clogging.

Visible Driving Pawls—In plain sight where you can always see them work. No danger of spoiling a whole wheel as with the enclosed kind.

Automatic Spring Draft—Prevents the driver, team and mower from being injured when striking an obstruction.

Runs Easy—Roller Bearings on the main axle, and the level crank shaft with bronze composition bearings make the **Adriance** run easy and last long.

Complete machines and full stocks of repairs carried by our Branch Houses in all principal cities and dealers everywhere. Any Flying Dutchman Dealer can show you the **Adriance**—ask him. Write us for FREE BOOKLET on Flying Dutchman Hay Tools.

MOLINE PLOW CO.

Dept. 119 MOLINE, ILL.

$15.95 AND UPWARD SENT ON TRIAL

AMERICAN CREAM SEPARATOR

Thousands In Use giving splendid satisfaction justifies your investigating our wonderful offer to furnish **a brand new, well made,** easy running, easily cleaned, perfect skimming separator for **only $15.95.** Skims **one quart of milk a minute,** warm or cold. Makes thick or thin cream. Different from this picture, which illustrates our low priced large capacity machines. The bowl is a **sanitary marvel** and embodies all our latest improvements.

Our Twenty-Year Guarantee Protects You

Our wonderfully low prices and high quality on all sizes and generous terms of trial will astonish you. Whether your dairy is large or small, or if you have *an old separator* of any make you wish *to exchange,* do not fail to get our great offer. Our richly illustrated catalog, *sent free of charge* on request, is the most complete, elaborate and expensive book on Cream Separators issued by any concern in the world. *Western orders filled from Western points.* Write today for our catalog and *see for yourself* what a big money saving proposition we will make you. Address,

AMERICAN SEPARATOR CO., Box 1075 Bainbridge, N. Y.

MORE MONEY EASIER AND FASTER WORK

You lose $1.00 on every six sheep you shear in the old way. The Stewart gets a length and quality of wool that brings the highest price. Extra profits soon pay for it. The Stewart has ball bearings in every part where friction or wear occurs. Has a ball bearing shearing head of the latest improved Stewart pattern. Its price complete, including 4 combs and 4 cutters of the celebrated Stewart quality is $11.50.

STEWART'S No. 9 BALL BEARING SHEARING MACHINE PRICE $11.50

gets all the wool and takes it off quickly and smoothly in one unbroken blanket. To shear with the Stewart Machine seems like play to those who have labored with hand shears in the old, hard, sweaty way. You don't have the same swollen aching wrists. You don't scar and disfigure your sheep with uneven shearing and spoil the wool with second cuts like you used to do. **Get one from your dealer,** or send us $2.00 and we will ship C. O. D. for balance. Money back if you are not well pleased.

Write for FREE catalogue showing most complete line of Sheep Shearing and Horse Clipping Machines in the world.

CHICAGO FLEXIBLE SHAFT CO.
143 La Salle Ave., CHICAGO, ILL.

Stewart Ball Bearing Clipping Machine

For Horses, Mules and Cows

It pays to clip horses and mules in the spring—they look and feel better, do more work, rest better and get more good from their feed. Clipping the flanks and udders of cows prevents the dropping of filth into milk. The Stewart can be used for clipping horses, mules and cows without change. It's the easiest to turn, does the fastest work, stays sharp longer and is the most durable. **Get one from your dealer,** or send $2.00 and we will ship C.O.D. **PRICE $7.50** for the balance. Money back if not well pleased.

SETTING A HEN.

To set a sitting hen and induce her to sit on a setting of eggs is not always an easy matter. In the first place, she is liable to be set in her ways, and not willing to sit where she is set unless she is set just where she chooses to sit. Of all instincts, the maternal is most immovably fixed. So, if you wish to move a broody hen to another place than that which she has chosen, go slowly. Leave her for two or three days until her broodiness has become an obsession from which she is not easily freed. Then, having arranged a new nest just where you want it, and placed within it a decoy of useless eggs, steal out quietly at night, without a lantern if possible, and gather the hen into your arms, with caressing touch, take her to the new location and put her gently into place, softly whispering "cuddle doon." She will probably stay while the darkness conceals the strange surroundings, but to make sure that the morning light will not bring an irresistible attack of homesickness, place a slatted potato crate over her. If you haven't any potato crates at hand, you shouldn't be setting hens. It is best to leave this potato crate in place for several days, removing it just before dark to feed and water the hen. Then it may be taken away and a dish of grain, with another of water, placed and kept within easy reach. Soft hay makes an excellent nest and it is often advised that a big sod should be placed beneath. It is a question how much influence such a sod exerts, for the fact that a stolen nest upon the ground usually yields a large proportion of chicks may be due to other causes than the ground. A stolen nest anywhere is usually prolific. Make the nest wide and shallow, at any rate. A deep hole leads to broken eggs and trampled chicks. Don't forget to dust the hen liberally with a good insect powder as soon as she has become well established; better forget her food than this. Work the powder well into her feathers, especially about the vent, and repeat this at least once a week while she is upon the nest. A sitting hen cannot protect herself from vermin, and she may be bled, even unto death, if not protected. This is the easiest time in the world to rid the mother of lice and protect the future chicks. A hen that is properly fed and cared for may safely be asked to hatch two broods of chicks before permanently leaving her nest. But, unless she is fed and watered and protected from lice, she will leave the nest after six weeks of sitting an emaciated physical wreck. To insure the hatching of all the eggs possible, it is well to remove the chicks as fast as they become thoroughly dry and strong, placing them in a covered basket behind the kitchen stove. The hen will then remain upon the unhatched eggs longer than she otherwise would. The large breeds are supposed to make the best mothers, and they certainly are willing to try, but this writer likes a mature Leghorn for this purpose. While not so inclined to become broody, perhaps, they are reliable when once they do start to replenish the earth; and being light of foot and active, they are not so apt to crush a helpless chick beneath ponderous claws while gazing stupidly about wondering where those distressed cries come from. They have the hot Mediterranean blood, too, and are perfectly willing to fight twice their weight in tomcats, if necessary to protect their young.

M. B. D.

Runt Pigs.

What is the cause of runt pigs in a litter of thrifty ones, and how are they avoided? Tried several ways and found only one way so far but do not know how long it will last. L. W. M.

Ohio.

There is no cure for a "runt" pig, and it is good policy to kill such a pig at birth. It seems probable that such a pig fails to receive average nutrition before birth, and the cause may be twisting of the umbilical cord so that blood circulation is impaired; or the cell elaboration and growth may be imperfect from the first, for reasons that cannot be confidently assigned. Runt pigs are least common where sows are in healthy condition. The fat, sluggish, overfed and under-exercised sow is more likely to produce runt pigs than is the sow that is properly fed and exercised. A. S. A.

AILING ANIMALS.

Periodic Ophthalmia.

I have a horse that has had sore eyes all Winter. First one is affected, then the other, very sore and inflamed. The horse is in good condition. There is a window right in front of her. What would be good for this trouble? H. S.

The disease no doubt is periodic ophthalmia (moon blindness) and recurs at intervals of a month or thereabout and causes blindness of one or both eyes after successive attacks. This may be retarded somewhat by slightly darkening the stable and twice daily washing the eyes with a saturated solution of boric acid applied each time on a fresh swab of absorbent cotton.

Lame Cows.

I have had two cows taken with lameness in stifle; when cow moved could hear grating of the joint. Cows taken with the same ailment were stabled side by side. Age of cows eight and 10 years; after becoming lame they lost flesh, could bear hardly any weight on legs. One was taken lame in May, soon after calving, one in October soon after calving, both heavy milkers, high-grade Jerseys; both out at pasture nights when taken lame, but were put in the stable night and morning to milk. Can you inform me whether there is any disease with such symptoms, or what do you think was the cause? N. H.

Oregon.

No disease would be likely to cause such symptoms. The cows no doubt have injured themselves in some way on pasture, or by jamming in a narrow gate, or falling on a cement floor or other hard surface. The grating noise suggests fracture of a condyle of the femur. We cannot suggest treatment without an examination, but such lameness in a cow tends to prove incurable. A. S. A.

Diseased Udder.

1. I have a Jersey cow about 12 years old. She has been giving milk since August, is rather thin but eats well. About three weeks ago milk from the right front quarter of her udder looked a little thick and dark, flesh in that quarter of udder seems a little thicker than remainder. At present the milk looks perfectly clear and seems all right until the utensils are washed with soapy water which forms a mucous substance. Could this be tuberculosis of the udder? 2. A four-year-old cow which freshened in October formed a habit of eating poultry droppings about three months ago. She eats well and is in pretty fair order. What do you advise in her case?

Virginia. D. J. D.

1. Tuberculosis certainly is to be suspected in such a case, and the cow, therefore, should be tested with tuberculin. More carefully cleanse and scald all milk utensils, as bacteria often cause stringy milk. 2. Give the cow an abundance of wheat bran and other meals and grains and she will not be so likely to have a depraved appetite. Also allow free access to rock salt. A. S. A.

Pig-eating Sows.

What should be done with a brood sow that will eat her pigs? I have one, a Berkshire, farrowed her second litter March 8, ate one pig when they were one week old, and two more at two weeks of age. I now take the sow from her pigs at night. She is in fine order, well housed, has been fed plenty of cabbage all Winter, and mixed grain chops, also charcoal and some salt. If no remedy I shall put her up at once and feed.

Pennsylvania. W. E. C.

The sow will be less likely to eat her pigs if you make digester tankage 10 per cent. of her feed when in pig. Also make her take abundant exercise daily and regulate her bowels by feeding roots and Alfalfa hay. If she is not a fine registered sow it may pay you best to fatten her for slaughter, as there is no certainty that she will not again eat her pigs. A. S. A.

Dropped Sole.

A friend has a valuable draft horse whose left front hoof is afflicted with falling sole. The outward hoof is contracted, and the sole falls so that at times the sole touches the ground, causing the animal pain. It is necessary to reset the shoe frequently, the blacksmith paring off the falling sole. The owner has been advised to bathe the sole frequently in soft soap. What can you advise?

New York. J. E. W.

The horse has been incurably foundered. Let the sole absolutely alone. Cover it with a dressing of pine tar and oakum, to be covered with a thick sole leather pad; then put on a wide webbed flat bar shoe which should rest only on the frog and walls. Reset the shoe once a month. A. S. A.

A Little Talk on "Protein," Etc.

By Charles Staff, Secretary of the Larrowe Milling Co., Detroit, Michigan, the World's Largest Distributers of Dried Beet Pulp and Manufacturers of Larro-Feed

Danger in Too Much PROTEIN

THAT word "PROTEIN" has undoubtedly misled more dairymen than any other term used in dairying, because it has been so often *misused* and abused. Heralded far and wide as the magic key to big dairy profits, thousands of dairymen are too apt to measure the value of every feed simply by the percentage of Protein it contains. To them, the higher the protein, the better the ration. *Nothing could be farther from the truth.*

For while a certain amount of protein is essential in EVERY ration, the real value of a feed cannot always be measured by the amount of crude protein it contains, an excess of Protein is as detrimental to the health of the animal as the shortage of it is detrimental to your profits. Then again, there is a considerable difference between crude protein and DIGESTIBLE protein—*a fact which should not be over-looked.*

For Example Take Linseed Meal

Why "36% Protein Guarantee" Is Misleading

There are two kinds on the market. New Process Oil Meal, (the kind which results from dissolving the oil in the crushed flaxseed with naphtha) is generally guaranteed to contain *36% PROTEIN,* whereas the *OLD* Process Meal (resulting from extracting the oil by pressure) is only guaranteed to contain *32% PROTEIN.*

Nevertheless the Old Process Meal is considered more valuable and sells at a higher price in the open market, because it has been found that the Protein in the Old Process Meal is 94% digestible as against 84% in the New Process Meal. In other words, reduced to real protein value as measured by digestibility the widely advertised 36% Protein Linseed Meal has no more protein value than the old process meal which tests only 32% protein, and contains considerably less fat.

This goes to show *the uncertainty* of feed values as expressed in percentages not based on digestibility. It also shows the risk you take, in attempting to buy not only Linseed meal, but all the other common ingredients in the open market, when you mix your feed at home. I know that thousands of dairymen follow the troublesome plan of mixing their own dairy rations, honestly believing that they are protecting themselves against adulteration, but, *I am prepared to prove* to any fair minded dairyman in America, *at my risk,* that there is a better, safer plan of selecting a feed for his cows.

I will prove to you on your own cows, at my risk, that you can have healthier cows, more milk and less labor by depending on the carefully analyzed, tested and ready mixed feed which we have perfected and named—

LARRO-FEED

The Ready-Mixed, Ready-to-Feed Ration

An Ideal Balanced Ration

We set out to make LARRO-FEED the best dairy ration ever produced—a ration that would not only beat anything already on the market, but anything that the dairyman could mix at home. We counseled with the greatest dairy experts, and conducted the most exhaustive tests under every conceivable condition. The result is LARRO-FEED—a better ration—a ready-mixed ration—*a guaranteed ration*—one that not only makes you more money and keeps your cows healthier, but also saves you all the bother of mixing your feeds at home.

You simply buy this *perfectly balanced ration,* ready-mixed in the sack and your cows will require nothing else except roughage to maintain their health and produce the maximum flow of milk.

Highest in Digestibility

A Feed Without a "Filler"

We claim for LARRO-FEED the highest digestibility of any dairy ration possible to compound; *plus perfect balance* of protein, fat and carbohydrates, *plus absolute freedom* from adulteration by weed seeds, corn cobs, oat hulls, oat clippings, mill sweepings, or any other filler of doubtful value; *plus absolute uniformity* both as to guaranteed food value of each ingredient and uniformity of mixture found in every sack.

You will find that LARRO-FEED never varies. It is always the same—always good. Such uniformity is absolutely impossible with the most carefully prepared home mixed ration. Our experts are constantly selecting and rejecting from the best the market affords. No ordinary test is sufficient—no manufacturer's claim is accepted. We analyze and test in our laboratories every carload of material to insure quality, then make a second laboratory analysis after mixing to insure uniformity.

What LARRO-FEED Contains!

Why We Use Dried Beet Pulp

No other dairy feed is constituted like LARRO-FEED. It is really a new discovery in dairy rations, which resulted from the wide spread use and experiments with Dried Beet Pulp. Practically every dairyman in America is familiar with the service our company rendered in the development of the Dried Beet Pulp industry. Perhaps you know how we fought against almost overwhelming obstacles to establish the efficiency of Dried Beet Pulp, as an essential part of your dairy ration.

We went so far as to feed hundreds of thousands of cows at our risk while doubting dairymen were making the test. We made good. We proved that Dried Beet Pulp came nearest to giving June pasture results. It has revolutionized the dairy ration of this country. It provided just the bulkiness and succulence needed, giving greater palatability to the feed and practically removing all danger of constipation and other digestive ailments.

Now we come to you with an ideal ready mixed ration called LARRO-FEED. A feed that contains just the right amount of the best quality, selected Dried Beet Pulp, mixed with choice Cottonseed Meal, Gluten Feed, Distillers' Grains, Wheat Bran, Wheat Middlings, and ¾ of 1% of salt.

What LARRO-FEED Will Do!

The Only Feed That's Guaranteed

We realize that the convenience of feeding LARRO-FEED right out of the sack will not alone induce you to give it a trial. It must prove to be a better feed, judged by what it will do for your cows. The convenience of the thing is a minor argument. The real test is whether it will produce more milk at no greater cost than the ration you are now using and whether it will maintain your animals in better health. If it will do these things, you won't hesitate to accept LARRO-FEED on its merit as a profit producer and at the same time you will appreciate the convenience of getting it in one sack, ready mixed and guaranteed from your dealer.

How You Can Know Without Risk That LARRO-FEED Will Make You More Money

We Furnish the Feed For This Test

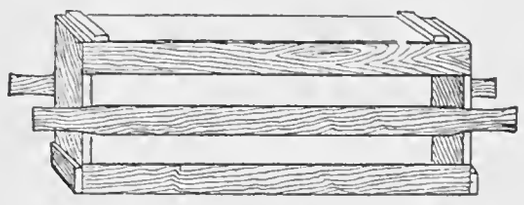
Simply go to your feed dealer and tell him you want to try LARRO-FEED at our risk. If he can't supply you write us direct. We will arrange to let you try 2 sacks (200 lbs.) on any cow in your herd at our risk. You simply watch results especially the second week. If you don't find that LARRO-FEED beats any ration you ever bought as well as any ration you ever mixed at home return the empty sacks and no charge whatever will be made for what you used.

The Larrowe Milling Co.

335 Gillespie Bldg., Detroit, Michigan

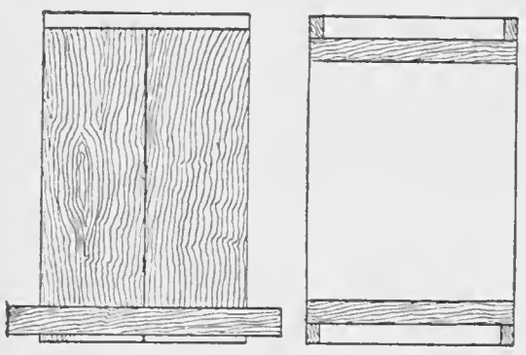
A SIMPLE HOG RACK.

H. R. H., of Ohio, asks how to build a simple and efficient hog-rack. The accompanying plan, shown in cuts, is one which T. M. Palmer, of Ashtabula County, Ohio, is using. It required but a little time for him to build it, and the plan may be adapted to any kind of lumber at hand. The rack should be about five feet long, and from 18 to 20 inches wide, 34 inches deep. Four standards of 1x4 inch stuff are used at the corners. Wider stuff may be used. For the side boards the builder used inch boards, eight inches wide. He used three boards to the side and allowed the middle board to extend at either end 10 inches for handles. At the top of the rack a 1x4



CRATE FOR MOVING HOGS.

inch piece is nailed across and another across the end at the top, leaving an opening an inch wide in which the end gate is placed. A 1x4 inch piece is nailed across the bottom at the ends, and the bottom boards come within an inch of these end strips so as to allow the end gates to slip in and be held firmly. The end gates may be made of two boards, the outside edges of which fit closely against the sides of the rack, and a one-inch square strip nailed across the lower edge. Care should be taken that about four inches in the clear should be left on the end boards, and here should be nailed a 1x4 strip with slightly projecting ends. These ends will prevent the end gate from falling through the rack, when it is lifted or tilted. By removing both the end gates, the rack can be used as a



ENDS OF HOG RACK.

chute, and for this purpose cleats should be nailed eight inches apart in the bottom of the rack. The end gates may be removed, the rack turned over a hog, and they will slip in the bottom openings as well as the top. When the bottom is used for the top, the rack may be turned over on a hog and it can be pushed along with the hog. In this way a hog may be loaded in any kind of a low-down vehicle or sled, where the animal will back.

It is not necessary to use lumber the dimensions of Mr. Palmer's specifications, and he advises two 1x4 inch boards in place of the eight-inch side board, and but one on the side may be used in the middle projecting beyond the end for handles. The rack will be a great deal better than "any old thing," that can be put together without plan or system.

WALTER JACK.

TRAINING A SADDLE HORSE.

I would recommend that B. D. (page 366) get a bridle with both curb and snaffle bits, as he will need both. In speaking of two of the gaits, I do not know which are desired, as there are five. A very good combination of gaits is the walk, trot and canter, of a three-gaited horse. To teach the horse to walk, ride her in the walk for several lessons, urge her to do her best and keep her at it during the entire ride. When she will keep it up without lagging you may teach her to trot. A horse must be able to walk four miles per hour at least. Use the snaffle rein mostly, the curb just tight enough to keep the head in position. Urge her from the walk to the trot, by a touch of both heels, and the whip if necessary. Use the snaffle mostly also, but keep it more closely against the jaw. No attempt should be made, at first, to produce speed, but an easy smooth action. After an easy, smooth and continuous trot is gained, you should increase the speed gradually.

You should always post when riding the trot. It makes it much easier to ride and saves the horse a great deal of jar. After you have the trot developed to your satisfaction, you may teach the canter. If, however, you wish your horse to single-foot you should teach the single-foot first, as it is harder to teach after the horse has learned to canter. Start the canter from the walk; if you let her go from the trot to the canter she will be apt to break into the canter when you wish her to trot. At first she will go at a fast gallop, but you should slow her down gradually to a slow canter, the slower the better. It will take some practice and a great deal of patience to teach this.

Mount the horse, draw the right snaffle rein until the head is turned slightly to the right. When ready to start, tighten the left snaffle, relax the right and lift the curb slightly, followed at the same instant with a touch of the heels in the flank, use the whip if necessary on the flank. This checks the left shoulder, and releases the right, causing the horse to lead with the right. A slight lift on the curb assists the front quarters to rise, thus keeping up the gait.

Do not let the horse break step, when disunited check her and start again. When riding this gait do not stand in the stirrups leaning forward with arms flopping, but sit close, gripping the saddle with the knees, and hold the arms close to the sides; keep a graceful position. There is almost no end to what you may teach a horse if you know how, and have the patience. It will not injure your horse to ride it if you do not let her get the habit of breaking into the canter when trotting.

H. H. F.

Jerome, Mich.

Overheated Horse.

I have a horse that is a bad blower in hot weather, and does not sweat. Can you advise me how to overcome it?

New Jersey. H. S. P.

The horse has been overheated at some time in his life and will never be likely to work comfortably in warm weather. Clip him in Spring. Work him in cool of morning and evening. Do not feed hay at noon in hot weather. Shade his head when at work. Feed oats, bran and hay.

A. S. A.

Indigestion.

I have a small grey mare about 19 years old that is troubled with catarrh of the bowels; has had it more or less for several years; at times not showing it for a long time, then it would come on again. At present it is quite bad. I have been feeding her mixed hay and long corn fodder cut about two inches long, one feed a day of the fodder; for grain about one quart of meal, or the same quantity of shelled corn ground with oats nearly equal parts; sometimes from two to five ears of whole corn at each feed. She is in good flesh and a good feeder. Had her teeth filed last Fall. I would like to know how to cure her.

Delaware. W. H. W.

Do not feed ground feed to a horse. Feed sound old oats and mixed clover hay, without cut corn fodder. Allow not over a pound of grain and a pound of hay per hundred pounds of body weight as a day's ration until she is well; then slightly increase the amount if she has work to do. Never let her stand a single day idle in the stable. If the scouring persists, mix in each feed a heaping tablespoonful of a mixture of two parts powdered wood charcoal and one part each of powdered catechu, ground ginger root, subnitrate of bismuth and prepared chalk.

A. S. A.

"WHO gave the bride away?" asked Mrs. Evans of her daughter, who had just returned from the wedding. "Her little brother," replied the daughter; "he stood up in the middle of the ceremony, and yelled, 'Hurrah, Blanche, you've got him at last!'"—Credit Lost.

NATIONAL FIRE PROOFING COMPANY, Syracuse, N. Y.

BREEDING BUTTERFAT; WORKING BULLS

How much can we improve the quality of Holstein milk by selecting the best specimens? What about working a bull?

It is possible within certain limits of increasing the percentage of butterfat by breeding and selection, although it is probably true that for market milk purposes it would be more desirable to look to the Holstein breed for quantity of milk, and if it becomes necessary to raise the quality or increase the butterfat or color, it is best to keep in the herd a few representatives of either the Jersey or Guernsey breed to supply milk of the quality desired. There are a number of instances that might be mentioned where the breeder is selecting Holstein sires from dams whose milk tested above the average in butterfat, instances where every female in the short tabulation of the sire's dam was a producer of say 4% milk. It is a debatable question whether this line of endeavor is worth while, for at best the amount of increase would be proportionately small, for in reality there is very little difference between milk testing 3½% and milk testing 4%. We oftentimes hear breeders state that they have relatively high-testing Holstein cattle, and that this condition is the result of careful selection and mating. It is reasonable to believe that improvement can be made along this line, in fact it has been done, yet just to what extent it is profitable would be hard to determine. It must be remembered, however, that if any change is made it must be necessarily slight, for in my judgment it would surely be foolish to start out with a 3% cow in an endeavor to get individuals that would produce 5% milk, since we have established at this time definite useful breeds that produce liberal amounts of 5% milk at low cost. In other words the Holstein breed of cattle is noted for producing milk of 3½% butterfat, and while instances are common where individuals produced milk of 4% quality and above, it is reasonable to believe that the bulk of the individuals will always produce milk of the 3 or 3½% quality, and it would be no doubt very difficult to produce both the quality and the quantity.

A bull can safely be put to work on a farm, and such activities will not decrease his usefulness as a breeder. In fact exercise is one of the essential requirements for successful management of a bull, and it is invariably the stall-fed bull whose potency is of questionable usefulness when he is two or three years old. Two years ago the Walker-Gordon farms were evidencing some difficulty in getting their cows safely settled, and put into vogue the practice of working their breeding sires, utilizing them in this case for hauling manure, and not only have they been able to increase the usefulness of the sires from a working standpoint, but they were able to get a higher breeding percentage and the bulls were much more easily handled and of less trouble to the care-takers. Of course, there would be a limit as to the amount of work and service that would be expected of a bull. He should not be expected to do team work to the extent of his ability and at the same time be responsible for heavy service in the breeding pen. As a rule bulls will look out for themselves when it comes to work, and it is true that more often they are not given enough exercise rather than they are given too much work. By subjecting a bull to regular work on a farm enables the owner to feed him a more substantial grain ration, which in turn is conducive to more efficient service as a breeder. Idle bulls are often given an excessive amount of roughage, and a minimum amount of grain, while their feet are often neglected, and their usefulness of short duration. In my judgment there is everything to be gained by breaking a bull to work either in harness or tread power. This will enable the owner to determine more accurately the real value of the bull, and he can keep him without great expense for maintenance until his first daughters come in milk, at which time their record of production can be compared with that of their dam's record, which is the real measure of value of a dairy bull. The present practice of selling bulls for three cents per pound that are worth $3 per pound is most unfortunate, and certainly the practice of working bulls, and letting them earn their feed by manual labor during the interval when they are under such test is one method of solving the bull problem. F. C. MINKLER.

COMPOSITION OF BUTTERFAT.

Does butterfat mean actual butter, or is there a difference? E. G. H.

Prof. H. H. Wing gives the following average composition of butter: Fat, 85%; casein, 1%; salt, 3%; water, 11%. In some cases there is more water than others. It ought not to rise above 15%, and there ought to be at least 80% of fat. Thus it will be seen that pure butterfat does not mean actual butter. It does mean enough of the fat combined with water to make it smear well on bread, and containing enough salt to give it a satisfactory taste. This question is frequently asked, so that it is evidently not clear to many people just what is meant by butterfat. If we remember that butter is the fat with water and salt added, we shall get a clear definition. A small quantity of casein or cheesy matter may be carried to the fat through the cream.

We may consider the difference between sugar and candy. Candy is made of sugar, yet all sugar is not candy. As the simplest form of candy, we may take molasses boiled down to a sticky paste. Molasses candy is usually made by adding more or less butter and sometimes other ingredients with the molasses, and boiling them sufficiently to make a thick sticky mass, which when cooled and pulled out so as to admit the air, becomes light in color and hard and firm in texture. While the candy contains molasses, molasses is not all candy, but as is the case with butter, is made from fat with the addition of other materials. The fat is the basis of butter and the fat test of milk, gives the amount of pure fat found in that milk. In order to figure the amount of actual butter that can be made from a sample of milk, we would find the amount of fat in that milk and then add about 15% to it, as this would give the amount of average butter which would be made from that fat.

Sweet Corn and the Silo.

I have two fields which will measure up about 15 acres together. I am in a quandary whether to plant this to silage corn for cow feed, or to plant it to sweet corn, selling the corn in New York and using the stalks and unsalable nubbins for silage, making up any shortage by purchase of cornmeal. Raising silage corn is undoubtedly the easiest, less care and less work than raising and selling sweet corn, but the latter appears to be the most profitable proposition. What say you? E. F. H.

This problem will require considerable figuring. Without question the field corn properly grown so as to form a good-sized ear, will make a better quality of silage than the sweet corn stalks with most of the ears picked off. From our experience such stalks of sweet corn, however, would be about equal in feeding value to the large silage corn grown in drills and not forming many ears. The weight per acre, however, of the silage corn would be much greater than that of the sweet corn. In Northern New Jersey, where the market for sweet corn is good, an acre of the late varieties properly grown and handled ought to bring from $50 to $60 worth of ears, in addition to the smaller ears of nubbins left upon the stalk. From a financial point of view, therefore, there would probably be a larger income from planting sweet corn, and selling the ears as is here suggested. Care, however, must be taken in handling a proposition of this kind. The earlier varieties of sweet corn would not be so satisfactory. The stalks are small, and will not give a heavy crop per acre. It would be better to cut these earlier varieties as soon as the ears are picked, and use them as green fodder to help out the pasture. The best results from this management will be in planting late varieties like Evergreen or Country Gentlemen, picking the ears in September, and immediately cutting the stalks into the silo. Silage from sweet corn stalks must be handled with care. The silo must be packed solidly.

To sum it up, a good field corn will give a better quality of silage, but it is doubtful if it would give enough greater feeding value from an acre to offset the cash returns from selling the ears of sweet corn.

Save All the Cream that Your Cows Give

BY TURNING your cream separator handle at the wrong speed you are losing anywhere up to half of your butter-fat. You are leaving this butter-fat in the milk because by "guessing" at the speed you turn your separator, you are not turning anywhere near the right speed. You are feeding, perhaps, 10 cows, and making a butter profit on only 5, 6 or 7 of them. But you can get a butter profit on all of them by putting a Stewart Speed Indicator on your cream separator. Thousands of dairymen who used to lose cream by turning at the wrong speed, just as you do now, are now saying it by using the

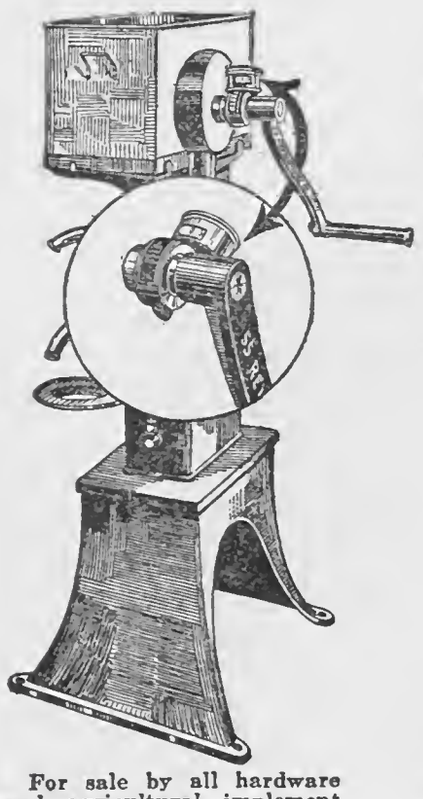
Stewart Speed Indicator for Cream Separators

This instrument goes on the crankshaft and shows how many revolutions you turn the handle per minute. There is no counting or timing—for the Stewart tells at a glance the exact speed you are turning the crank.

How You Lose Cream Without The Stewart Indicator

You cannot crank your separator at the correct speed by "guess". No living soul can do this. We tried thousands of people, and hardly one came anywhere near correct.

Any authority on dairying will tell you that even one wrong revolution per minute means a loss of cream. If you turn too slow, cream is left unseparated in the skim milk. If you turn too fast, particles of fat in the cream are burst and spoil the quality of the butter. Most people crank too slowly by ten to twenty revolutions per minute.



For sale by all hardware and agricultural implement dealers all over the world.

One dairyman with 20 cows lost $524.10 in one year by "guessing" at his speed. He found he turned it just half fast enough. Actual tests at Purdue showed this.

Another dairyman writes that he owns 8 cows and lost $18.50 in one month because he "guessed".

With the Stewart Speed Indicator attached to your separator you turn the crank properly every time and so save every possible bit of butter fat.

Fits Any Separator—$10

It doesn't make any difference when your separator was made or what kind it is. The Stewart will fit it. Tell us the name, the number, and the year it was made and we furnish the Stewart Speed Indicator on a new crankshaft that you can easily put on. (If your separator is a De Laval, then no extra crankshaft is necessary.) The price is but $10 complete.

30 Days Trial

If the Stewart doesn't increase your cream production, return it and get your money within 30 days.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Value of Mangels.

Will you advise me whether sugar beets or mangels make a good feed for pigs and which is the better? Should they be fed to pigs cooked or uncooked? Which will make the more milk when fed to cows? How will one peck beets compare in feeding value with one peck balanced ration of grain? J. R. M.

Mangels or sugar beets, with a proper amount of grain, are very beneficial to hogs. The sugar beets contain considerably more nutrients than the mangels. I should advise feeding the beets raw. The nutritive ratio of beets is similar to that of oats. However, the beets contain about 90 per cent. of water, while the oats contain 10 per cent. of water. A fair comparison of beets with oats or barley would make one pound of the grain worth six to eight pounds of beets. The beets, however, cannot entirely take the place of grain, though on account of their succulence their feeding value may be more than their analysis alone would indicate. C. L. M.

Feeding Work Horses.

Will you balance a ration for horses weighing about 1,200-1,300 pounds from the following feeds? Oats 60; bran $1.45 cwt.; mixed feed $1.60 cwt.; hominy and cornmeal $1.75; gluten $1.80; brewers' grains $1.45. I have heard the grains were good cheap horse feed. The horses are in good flesh and I would like to get them ready for the Spring work.
New York. O. P.

The following ration has been found by experiment to be satisfactory for horses weighing 1,000 pounds, and doing rather heavy work: Hay six pounds; wheat bran two pounds; corn, unground, four pounds; brewers' dried grains, eight pounds. For farm work my own advice would be to increase the amount of hay in the above ration to about 14 pounds for a 1,200-pound horse, and feed 15 pounds of grain daily. This is for horses at hard work. When idle or doing light work decrease the grain. Oats alone, or two parts oats to one of corn by weight, also make a good working ration for work horses. Feed the same as above.
C. L. M.

Value of Sorghum Silage and Seed.

Could the blades from stripping sorghum cane and the cane tops be used to advantage for silage, in connection with corn? If so about what proportion in weight would one dare use for good results? Can you give me an approximate estimate of the food value of sorghum seed? A. V. H.
Pomeroy, O.

There is no reason why blades from stripping sorghum cane and the cane tops could not be used to advantage for silage in connection with corn; in fact, the sorghum fodder leaves contain about 20% more protein than sorghum fodder, 5% more dry matter and 20% more of the carbohydrates.

According to Henry's "Feeds and Feeding," the digestible nutrients in sorghum seed are as follows: Crude protein, 4.5%; carbohydrates, 61.1%; fat, 2.8%. According to this analysis sorghum seed would compare favorably in feeding value to buckwheat flour or dried beet pulp, the former having a trifle more protein, while the latter, of course, contains no fat. The fair valuation, therefore, of the feeding value of sorghum seed would be about $26 or $28 per ton.
F. C. MINKLER.

Ration for Holstein.

Will you make up a balanced ration for a Holstein cow coming fresh in the middle of April? I have Timothy hay for roughage, and have oats that I can have ground. I can buy all kinds of concentrates. What should I feed after turning out to pasture? B. S.
New York.

A very good ration would be as follows: Ground oats three pounds, bran two pounds, oil meal two pounds and cottonseed meal two parts, by weight, one part of cornmeal and one of bran. The amount which can be fed with profit will depend on the amount and succulence of the pasture grass. C. L. M.

Milk Ration; Small Silo.

Will you give me a ration for cows, milking, grade Jerseys, from 800 to 1,000 pounds each, of the following feeds? I am feeding Timothy and clover hay, and have Ajax, cottonseed meal, cornmeal and bran. Can a silo be profitable when only four or six cows are kept and what size of silo 20 feet high would he required?
New York. W. H. B.

The following grain mixture will give you good results: Ajax flakes two pounds, cottonseed meal, three pounds, cornmeal one pound and bran two pounds. It is doubtful whether a silo will pay for only four to six cows. However, this will depend on many conditions. You will have to consider the cost of filling the silo, including growing the crop, and also the returns from the milk. A cylindrical silo nine feet in diameter and 20 feet high will hold an ample supply of silage for six cows, but a better size would be seven by 30 feet. C. L. M.

FISH MEAL FOR FEEDING.—In Germany feeders of beef cattle and hogs have been experimenting for sometime with fish meal as a feeding stuff. This meal is a ground-up residue from the extraction of oil from fish. This oil is forced out by pressure after thoroughly cooking the fish. The residue comes in the form of hard cakes, which are ground up into a meal and used for feed. For a time it was thought that this meal might prove injurious, especially when fed to dairy cattle, as it was thought likely that milk and butter would taste. This has apparently been overcome, and especially for beef cattle and pork-making the use of the meal now seems to be growing rapidly. It is hardly likely that this method of feeding will develop very fast in this country, although we shall probably come to it eventually. All over Europe the demand for cheap feeding products is constantly growing in excess of the supply, and European feeders are scouring the earth in the hope of obtaining new and cheaper products. The ocean contains an almost inexhaustible supply of food for man, for beast and for plant. It is largely a matter of learning how to take out this plant food and make it available.

"P'TATERS is good this mornin', madam," said the old farmer making his usual weekly call. "O, are they?" retorted the customer. "That reminds me. How is it that them you sold me last week is so much smaller at the bottom of the basket than at the top?" "Waal," replied the old man, "p'taters is growin' so fast now that by the time I get a basketful dug the last ones is about twice the size of the first."—Business.

It Is Yours Free

We want you—and every other progressive farmer—to have our booklet on "Concrete in the Barnyard." It will help you to build your farm equipment with permanent structures of concrete. This book is a practical guide in the construction of such barnyard improvements as concrete feeding floors, watering troughs, hog wallows, dairy barn floors, manure pits, etc. It tells simply and clearly just how to build them. The booklet and any other information you desire on concrete construction sent you on request.

Corn, bushels	103,150
Oats, bushels	312,500

Wholesale Prices at New York,
Week Ending April 17, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high-scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are running $1.61 and $1.51 for B and C. Hotels and restaurants using two to three cans per day are paying 5¼ to 5½ cents per quart.

BUTTER.

The week is closing with large supplies, and a decline of one-half to one cent from last report, and considerable pressure to keep cleared up, especially on fresh creamery. Business in the lower grades of factory, or "ladles," as it is now called in New York, and packing stock is very good, at prices running from 12 to 18 cents.

Creamery, extra, lb	25	@	25½

Elgin, Ill., butter market firm at 24½ cents.
Philadelphia, western creamery, 25 cents.

CHEESE.

The drop in prices caused some decrease in supplies, as shipments were diverted to other places. The main difficulty with the market seems to be the surplus of uncured and off-flavor cheese. When old cheese is high the temptation to hurry along the new make by high temperature curing is great. But there is always a bad reaction from this practice. Retail trade falls off rapidly because consumers do not like the ill-ripened cheese. The defect may sometimes be in the material or the way it is handled in making, but it is more often improper curing, thus discounting the price two to three cents per pound, or even more.

Whole Milk, new, best	14	@	15
Old, best	18	@	19
Common to good	14	@	16½

EGGS.

Receipts continue large, arrivals for the first three days of the week being 3,170,000 dozen. Prices have declined two to three cents on most grades, and at the lower figures considerable speculative trade is noted. The general range of prices is about on a level with last year.

FRESH FRUITS.

Arrivals of barrelled apples are light, the majority being ordinary fruit, which sells slowly. Fair to good grades of such standard varieties as Baldwin bring from $4 to $5 per barrel. Strawberries in light supply, but considerably off in condition and selling slowly.

Apples—Spitzenburg, bbl.	4 00	@	5 50

VEGETABLES

Potato receipts have been large, with several thousand sacks from Europe admitted as free from disease. Prices run the same as last week, except on grades below medium, which are discounted as much as appears necessary in order to make sales. New onions from Texas are in heavy surplus and lower. New cabbage running inferior in quality; demand for the better grades good. Southern tomatoes in very large supply, but poor and selling low.

*

Wool imports for the eight months ending February 28 amounted to $37,756,785. Of this $23,602,089 was for 116,133,979 pounds of raw wool, and the remainder manufactured goods.

Silk imports for the same period were 20,096,563 pounds of raw, worth $66,402,974, and $15,009,033 in manufactures.

*

A cargo of meats recently arrived at New York direct from Melbourne, Australia. Most previous consignments have been trans-shipped from England. Among the items of this lot were 1,624 quarters of beef; 2,000 carcasses of mutton and 400 of veal. Argentine beef, running about 9,000,000 pounds per month, is being received at New York.

BOSTON MARKET REVIEW.

Fruit prices in Boston market are high for the season as the rule, especially on fancy apples, cranberries and strawberries. Florida oranges are also on the raise, but California stock is plenty and reasonable. Best fancy native Baldwins from cold storage bring up to $7 per barrel, with good to fair going at $4 to $6. The poor grades are in less demand and prices uneven. Western box stock $4 for Winter Banana and $2.50 to $3.50 for other varieties. Good native Russets $3.50 to $5 per barrel. Cranberries at $15 per barrel, return good money to the lucky holder. Florida oranges, best, $4 per box; California stock about $2.50. Cuban stock ranges anywhere between the other two. Strawberries around 40 cents per box, which price tells the story of short supply because of frost damage. Good lemons about $4 per box, others $2.50 and $3.50. Grape fruit $4.50 for Florida, California $2.50, with Cubans at about $3. Pineapples go at about $4 for crate with supplies getting more plentiful; prices are working lower. Bananas plentiful and prices reasonable to buyer; best large

NEPONSET Paroid Roofing

There's a NEPONSET Roofing for Every Building

GET Neponset Roofings—the "slowly made" kind. Then you are sure to get roofings that are slow to wear out. Then you'll never get a poor roofing when you need a good one.

Neponset Roofings are long on the roof—because long "in the making." This means more than you think. It means this: Maximum protection to your home—your stock—and your pocket-book. Protection against leaks—repairs—and that greatest danger of all—fire. Remarkable "year-in-and-year-out" protection—in cold or hot climates—at a minimum cost—this is the "blanket protection" slowly made Neponset Roofings *invariably* give.

There's a slowly made Neponset Roofing for every purpose. Neponset Paroid is the great roofing for fine farm buildings.

Other Neponset Roofings are—Neponset Shingles for residences; Neponset Proslate, the colored roofing.

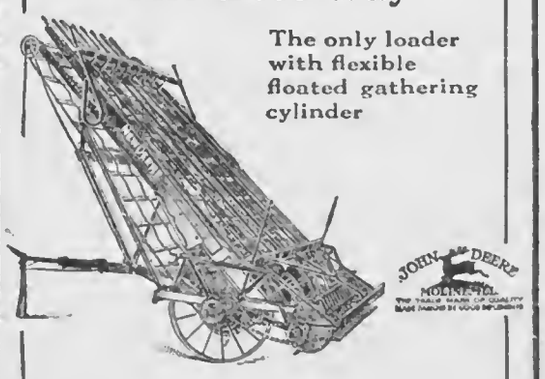
Make Your Hay The Best Way



The only loader with flexible floated gathering cylinder

New Deere Hay Loader

The loader with the floated gathering cylinder with its numerous flexible fingers which successfully handles anything from the lightest swath to the heaviest windrow without adjustment. It picks up all the clean hay but leaves the trash. Puts hay on the center of the wagon so that none falls off. An easy running loader noted for its gentle handling of the hay. None of the foliage, the most nutritious part of the hay, is damaged. Use a New Deere Loader. It not only does the work well at first, but does it for many years.

Dain Side Delivery Rake

Gently gathers up all the hay without damage and leaves it in fluffy windrows through which the air can readily pass so that it is cured without sun scorching. It makes best quality hay.

The rake with the steel arch and a reel with three sets of closely succeeding flexible teeth. A construction which means not only durability of machine but gentle handling of hay—a John Deere implement.

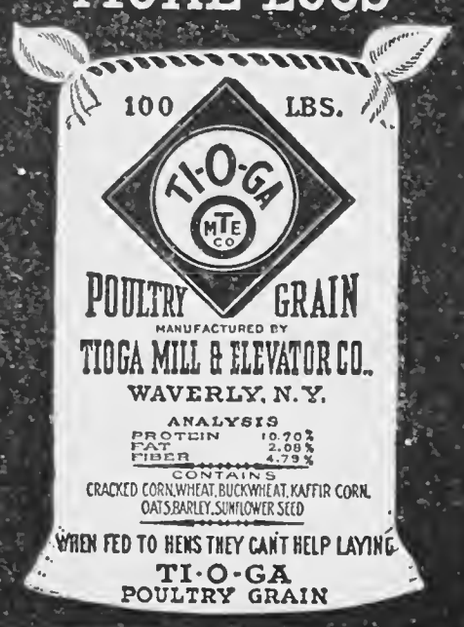
MAKES HENS LAY MORE EGGS



IT INCREASES THE CAPACITY OF GOOD HENS, AND MAKES EVEN A POOR HEN DO HER LEVEL BEST

300 LICE Or More on One Hen

is by no means uncommon. No one would expect to fatten a steer with that number of "ticks" sucking his blood, but many expect the old hen to go ahead shelling out eggs while lice and mites are sapping her very life. We have counted over 2000 dead lice under a row of ten hens, on a roost board painted the night before with Lee's Lice Killer. This great killer does double duty—contact kills mites, lice, bedbugs, etc. about the roosts; the vapor kills lice on the chickens sitting over it. Put up only in airtight cans. For sale at over 10,000 towns.

Three sizes—35 cts., 60 cts., $1.00. Poultry Book free.

Keeping Green Bone.

Will you tell me how to keep raw cut bone so it can be fed in the Summer?
New York. J. C. R.

Green cut bone cannot be kept for a great length of time in warm weather, and should be cut and fed while fresh. Mixing it with some absorbent like dry bran will aid in keeping it sweet, and it will, of course, keep longer if stored in a cold place than in a warm one; you should plan, however, to cut it as needed for immediate use and not attempt to keep it longer than you could keep fresh meat under the same circumstances.
M. B. D.

Standard for Indian Runners.

I breed Indian Runner ducks, fawn and white, according to the present standard of light fawn. I wonder if the standard is to be changed when the new standard comes out in 1915, to the dark fawn and white, with very dark heads? There was a lot of talk about changing, and if it is changed, I want to know it before breeding this year. My ducks cleaned up everything by the present standard, but I want to be prepared for the future too. N. H. B.

Not being on the inside of the councils of the A. P. A., I cannot say what will be done in the new standard. My opinion is that there will not be any great change in the fawn. The admitting of the English Pencilled and the White Indian Runners as distinct classes will probably tend to keep the American birds in a middle position as regards color, neither very dark nor very light. With (erect) carriage and shape credited with 61 points out of a hundred, it would seem that these two features are of more importance than color.
W. H. HUSE.

The Productive Hen.

I see so many different ways of feeding; some get their reward in eggs, while others do not. It is interesting to read about purebred stock; how about the mixed breeds? As a general rule I do not think that all hens are doing as well as they ought to. This season we have a flock of 105, where we had about 75 last year, and get from four to eight eggs a day more now than last year. During December, 1912, we got 40 dozen. This month we have 60 dozen, up to date. We have no choice in any particular breed, but for the last five years we have had a purebred male. The French Frizzle hen does well crossed with R. I. Reds, but last year we got a Ancona. Most of our pullets are black. The Frizzled hens lay almost every day and are a nice looking hen; lay large eggs. I cannot give any particular color of eggs, as so many crosses cause mixed colors of egg shells. What do you think of the ration I am feeding, and the amount? I like to feed enough, and give a little more than they will eat, but none is wasted. Morning eight pounds mixed scratch feed thrown in litter, noon 10 pounds buckwheat; at night four pounds oats soaked during afternoon with hot water, and into which I mix a poultry tonic. Next day I start out with scratch feed but in place of buckwheat feed dry oats and at night a mash of four pounds, two parts cornmeal and one part bran, handful of beef scrap and cottonseed meal dampened. Third day, morning feed is the same, but noon they get corn on ears, and at night a prepared mash with a tonic; grit and oyster shell, also charcoal, with plenty of fresh water before them all the time. Once a week they get copperas water, which we find very healthful if not given in overdose. They have plenty of litter to work in. Green food like cabbage every other day. Dry oats and buckwheat are in a box; hens are always busy in them. I go to the henhouse a lot of times during the day and the hens are very tame. Most farmers feed their hens in the morning and do not see them till night, and then growl because the hens are as wild as hawks and do not lay. I think J. F. C. is right in his way of thinking in regard to White Leghorns; they are too wild, and are not so easy to tame as most other small breeds, which are all more or less wilder than the larger breeds. W. G. L.
Derby, N. Y.

Your plan of feeding is certainly a novel one, and violates about all the orthodox rules for feeding poultry; still, the test of any method is its results, and if yours are satisfactory, no one need criticise. Personally, I should feed mash every day, either dry, in hoppers, or moistened and fed at noon, and I should not keep whole grain constantly before the fowls in open boxes; neither should I feed poultry "tonics" unless my fowls were sick, and then I shouldn't do it either. I would not mix breeds as you are doing, but would keep one kind, and that purebred. I should not care to have my eggs of mixed colors; either a pure white or a pure brown suits the market best, and most of us have to cater to the market. While you are doing well with a small flock, I feel pretty sure that if you ever go onto a farm and keep poultry as a business you will find it advisable to change your methods somewhat. M. B. D.

More Money From Your Hens!

Do You Want to Learn How?

WE are in a position to help you with your poultry. The best poultry writers in the country are ready to answer your questions, and will direct you step by step in the development and care of your flock. Through their help you may become an expert yourself, if you will follow their suggestions and take up a line of reading in connection with your practical work in the henyard. This service is free to all subscribers and their families. Make frequent use of it, and begin at any time.

THE SETTING OF THE HEN.

(After Bryant.)

Come, let us set the clucking hen.
Cleave not her neck with shining blade;
Soft let her strawy bed be made;
There lay the eggs, and there
Place the bristling creature with kindly care,
And press her down tenderly.
As, round the embryos 'neath her feet
We softly fold the cradle sheet.
Thus, then, do we set the hen.

What set we, then, 'neath this clucking hen?
Eggs, which after a score of days
Shall burst their shells, with chirps of praise;
Chicks, which the hen, with motherly breast,
Shall croon, and peck, and hide in nest:
We set within the guarded pen.
Destruction for the front-yard flower,
Havoc, wrought in a single hour,
When we set the clucking hen.

"Who set this old Dominique hen?"
The master, at no distant day,
Thus to his distressed wife shall say:
And gazing at the flower bed's wreck,
The wife shall answer, holding tears in check,
A pest of the land was he, then,
Bane of rude and thoughtless times;
And 'tis said he made some foolish rhymes
On setting the clucking hen.

M. B. D.

THE EGG-LAYING CONTEST.

The twenty-third week of the contest shows a slight loss, 39 eggs less than the previous week, the total being 3,607. The Barred Rocks are showing up well in this year's contest, far better than last year, when the majority of the entries were year-old hens. Frank Tuttle's pen of Barred Rocks take first place again with a score of 58. Two of his birds laid seven eggs each during the week. Another pen of Barred Rocks belonging to Waveny Farm laid 53, and Jules J. Francis' pen of the same breed laid 51, and the remaining pen of Rocks—A. B. Hall's—laid 45. This makes the pen average of the Barred Rocks for the week greater than that of any other breed, the average being 51.75. The White Wyandottes are next, their pen average being 50.2 for the week. White Wyandottes also take second place in the week's score, Merrythought Farm's pen laying 55. Storrs Agricultural Station's pen of White Leghorns are third with a score of 54. Barred Rocks tie with Tom Barron's White Wyandottes, and Storrs Agricultural Station's pen of White Leghorns (pen 42, the sour milk pen), for fourth place, each laying 53. Four pens laid 51 each.

Below I give the week's report and totals of the best pens:

GEO. A. COSGROVE.

Poor Hatches.

Last January I bought an Orpington cockerel, two hens and two pullets. Soon after I bought 15 White Leghorn pullets and a cockerel. Both pens have been laying splendidly from the first. The eggs are fertile and the coops are clean. I feed the Orpingtons a mixture of barley, beef scrap, wheat and buckwheat in the morning, and wheat and corn in the evening. Whole oats, bran, shell, charcoal, and grit are kept in hoppers before them all the time. The Leghorns I feed barley and oats in the morning, a mash of ground oats, cracked corn, wheat middlings, bran, Alfalfa meal, beef scrap and oil meal at noon, and wheat, buckwheat and corn at night. Wheat bran, charcoal, shell, and grit are kept before them all the time. Both pens are fed boiled potato peelings or raw mangels every other day. The whole grain is thrown in a deep straw litter. Lice are very scarce, yet out of 150 eggs set I have hatched four chickens. The Leghorns have had a slight cold, but the Orpingtons have not. What is the matter? M. W.

If these eggs were hatched in an incubator, the machine or its operator may, of course, be at fault, but if they were set under hens, I can account for the small hatch only on the ground of weak fertility. This may have been due to any one of several causes, but the most probable one is close confinement and heavy laying through the Winter. Hens or pullets that are shut up and forced for egg production through the Winter may produce perfectly fertile eggs in the Spring, but containing germs of such low vitality that they will never reach full development and leave the shell. There is also the possibility of lack of vigor in the males, but this would probably be noticeable in their behavior. If you can turn these fowls loose upon free range for a week or two before attempting to hatch any more eggs from them, you will be quite likely to get much more satisfactory results. M. B. D.

GRINDING ROOTS FOR HENS.—I notice an inquiry for a machine to slice vegetables for chickens. I have found a cider mill to answer every purpose. Just grind up the vegetables as you would apples for cider, but do not press them. They are broken into small pieces, and the chickens eat every bit of the ground vegetables. I have ground almost all kinds of vegetables, and found it successful. A. B. Y.

Lexington, Ky.

"MRS. Alden has five children; if there were seven more, how many children would Mrs. Alden have?" Several hands were raised. "Anna may tell us," said teacher. "How many children would she have, Anna?" "Enough."—New York Evening Post.

P. F. RAFFERTY, Marlboro, Mass.

The Orange County Poultry House

(Patented)

Its use revolutionizes life in the country on a farm. As a general thing I personally feed and water all my hens, for all day, between 7.30 and 9 a. m. Between 4 and 5.30 p. m. I gather the eggs, and count it a poor day when I don't get from $15 to $20 worth. Some days recently they have laid 1,200 or better when market quotations were 26 cts. per doz. Some labor contrast between that and making $26 worth of milk a day. Catalogue and price list on application. O. W. MAPES, - - Middletown, N. Y.

RHODE ISLAND REDS

The famous Vibert flock of beautiful, brilliant, glowing cherry to mahogany red-to-the-skin rose and single comb thoroughbreds. Not uncertain layers mated to males from uncertain layers, but specially selected, long backed, low tailed, certified trapnested record layers, scientifically line bred along Government lines for heaviest winter egg production, with yearly trapnest laying rates of 211 to 267 eggs; bred away from broodiness, and mated to large, vigorous, brilliant red males out of heaviest trapnest record layers. Heaviest winter laying, large, hardy Reds in America, hen hatched and raised, on absolutely free range, in wide-open front colony houses, on a scientific plant absolutely free from roup and white diarrhoea. Highly fertile, clean, well shaped, unblemished eggs, gathered hourly, shipped daily, delivered when wanted, guaranteed unbroken. Vibert Vitality Day Old Chicks. Splendid breeding cockerels from trapnested hens, trios, mated breeding pens for sale. Prompt shipment, safe delivery all over North and South America, courteous, strictly upright dealings. Mating booklet upon receipt of stamp.

PUBLISHER'S DESK

We received the check for $845.56 last evening. God will surely bless you for the good work you are doing. Oh, such a relief to know we have got our hard-earned money back! It will teach us a lesson that we shall never forget. Will you please send us a bill for your trouble and time? God bless you. J. F.
Massachusetts.

This good woman and her husband took three installment contracts of a New York real estate operating company, and paid the installments on the first one for about three years, on the others for shorter periods, until they had paid in a total of $845.56. At the time of signing the contract with a soliciting agent they were told they could withdraw at any time and get their money back with interest. Recently, when they needed the money, and asked for it, they were told their contract entitled them to a return of only $699.22. This would be $146.30 less than the amount they paid in, without any interest at all. They were satisfied to get back the actual amount they paid in, but this was refused. When we took it up, different compromises were offered, which we refused. We believed the courts would give the investor a judgment for the full amount with interest; but we like to avoid suits if possible and the company finally decided to return the full amount of payment.

There is, of course, no bill for our services. If we did not have 160,000 farmers back of us, this company would laugh at any demands we might make on them. These good people are one of the 160,000. In using the influence of the paper for their just interests we feel THE R. N.-Y. is simply exercising the rightful functions of a farm paper, and yet we do not deny an element of personal pleasure in the gratitude of these good friends.

Please read the inclosed clipping from Up-to-Date Farming. I happen to know this Everitt, as I was raised near that town. I do not think it is time for him to turn into an angel yet. In fact he makes me tired. Please don't stop my paper. C. H. H.
Florida.

This refers to J. A. Everitt, the Indianapolis promoter, seed distributor and paper publisher. He has a simple way of disposing of any agency that interferes with his promotion schemes. He thinks it a crime to publish a paper like THE R. N.-Y. and is going to dispose of its criticisms by asking farmers to "stop it." Mr. Everitt has had some experience with stop orders. He published a cheap farm paper once of such a nature that the Government told him to "stop" putting it into the mails, and he "stopped." In the little Pennsylvania town where he began his career it is said the farmer's there "stopped" buying common potatoes for new seed varieties before Mr. Everitt went to Indianapolis. Some years back Mr. Everitt "stopped" encouraging the organization of the American Society of Equity after the members "stopped" contributing a part of their annual dues to support his private business. So it is seen that Mr. Everitt has had some experience with "stop" privileges. He now says that the "sincere men" who showed him out of the door of the American Society of Equity landed in jail and that the society went to "pot." We admit the Everitt part of the society went to "pot," but the men who wanted nothing of Everitt or his schemes went ahead and organized the society on coöperative lines and it is now a strong organization free from all taint of Everitt promotion schemes. Everitt is now trying to organize a new society. He admits that he is to get 25 cents out of the initiation fee paid by farmers on taking membership in this society. We do not need to say that THE R. N.-Y. is in favor of farm organizations by farmers. We have never known farmers to be organized by outsiders except for selfish purposes. When the outside promoter gets a fee, he is subject to suspicion and criticism. Before farmers of the Northwest place too much confidence in the Everitt schemes, they would better look up his recent records in the sale of "Miracle" wheat. Mr. Everitt flatters himself. He says THE R. N.-Y. is an ardent hater of J. A. Everitt. THE R. N.-Y. knows Mr. Everitt only by his acts and his record. It does not hate him ardently or otherwise. THE R. N.-Y. does not even hate fakers or crooks. It does hate fakes and crookedness.

What do you know about the Dan Patch Railroad referred to in the inclosed letter from M. W. Savage?
Kentucky. W. N. S.

To start with we know the letter is written and printed in a way to attempt to deceive you. The attempt is to make you think it is a personal letter written you with a pen by Mr. Savage. It is a printed process letter and no doubt goes to a whole list of possible investors. The only thing personal about it is your name skillfully written in at the address in a shade of ink a trifle lighter than the ink used in the printed letter. The purpose of this ingenuous letter is evidently to induce you to send $100 for a share of stock in the Dan Patch Railroad under the inducement of getting another share free. There is a lot of talk in the letter about confidence in Mr. Savage, his big and profitable enterprises, the people's profits, and a lot of similar guff. But there is not one definite word that would enable you to pass an intelligent judgment on the value of the bit of printed paper Mr. Savage wants to send you in exchange for your $100. Suppose you had a horse you wanted to sell. You fixed up a printed circular to look like a private letter and to read like one. In the letter you said you had made lots of money in different enterprises, that you wanted the confidence of the person addressed, that the people ought to own horses, and that you gave them a chance at these profits by offering them a horse for $100, and as a bonus you would give the buyers free another horse. You would be careful not to say what the horse cost to raise, or what he weighed, or what blemishes he had or what he was capable of earning. If one of the personal-printed, process, private letters fell into Mr. Savage's hands, do you think he would send you $100 and ask you to send on the horse? Don't you think he would want to know something about the value of the horse itself before he sent the check? Our judgment is that you ought to know as much about the Dan Patch stock before you buy it as Mr. Savage would want to know about your horse before he sent you a check for it.

I. W. Rosenthal, Portland, Oregon, advertised "A new Shubert piano, used one month, cost $550, will sell for $250." Investigation showed that the piano had been used seven years and the original price was $350. This evidence was sufficient for conviction.

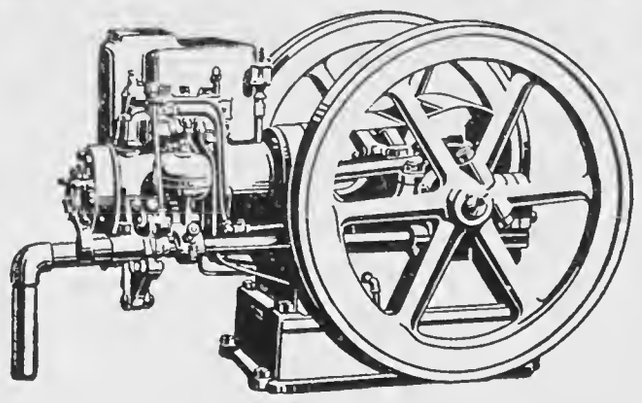
After a trial of four days, Harry L. Franc, manager of the King Furniture Company, Trenton, New Jersey, was found guilty of violating the advertising law by advertising "at $165, pianos equal to $350 and $400," which was alleged to be "misleading, untruthful and deceptive." Franc's counsel prepares to carry case to higher court.

The above is record of two convictions in alleged fraudulent piano advertisements. Heretofore it has been difficult to get convictions in such cases, but the new laws of many States against deceptive advertising, together with the growing public demand for honest advertising, seem to make convictions more certain.

If you mean business in your reply to Dr. Ulman on page 246, put me down as one subscriber who desires to enlist in the movement. I am also heartily in favor of the amendments proposed by A. F. J. on page 510. I am a regular subscriber of six farm papers, and while I have satisfied myself that they all try to conduct a clean, honest advertising section, THE R. N.-Y. is without doubt the most particular and conscientious along that line, and I am willing to submit my list to the rules proposed by A. F. J., and will gladly assist in trying to persuade the publishers to drop any advertiser whom you have proven to be dishonest. Thanks for your efforts in securing fair play for the farmer.
Michigan. W. H. A.

We certainly mean business if enough people signify their interest to warrant going ahead with an organization. We set the minimum limit at 100 volunteers. We have had quite a list, but not enough yet to meet the requirements. J. J. D.

THE lecturer raised his voice with emphatic confidence. "It is my belief, and I venture to assert it," he declared, "that there isn't a man in this audience who has ever done anything to prevent the destruction of our vast forests." A rather timid, henpecked-looking man quietly arose in the rear of the hall and said: "I—er—I've shot woodpeckers."—Everybody's Magazine.



Power Out of Cheap Oil

By means of the Secor-Higgins Oil-Fuel System, the system that has made the Rumely OilPull Tractor so successful, the

Falk Kerosene Engine

burns cheap kerosene and distillate, and furnishes convenient, reliable power for every farm purpose.

The Falk is easy to start in any weather—once started it requires but little attention. It runs evenly on a big load or a small one and will save money on either.

In sizes from 3 to 20 horsepower, mounted on skids, trucks or stationary bases.

A smooth running all-round power-plant for threshing, husking—shredding, baling, silage cutting, spraying and sawing.

Rumely service is back of every Rumely machine—49 branches and 11,000 dealers—supplies and repair parts on short notice.

Ask for Falk catalog No. 118.

BOSTON MARKET REVIEW.

(*Continued from page 651.*)

about $3 per bunch for yellow stock, seconds and thirds $2.50 to $1.25; reds $4.50 down to $2.

Asparagus plentiful at $3 to $4 per dozen bunches; California celery $2 per dozen is the rule. Florida tomatoes coming plentifully, but not in good quality as the rule, and prices are hard to maintain which give a profit to handlers; $2 to $3 per crate is about the prices, with native hothouse going at 40 cents per pound. Cucumbers are paying fair at $9 per box for best, others $7 to $5 according to condition and quality. Southern string beans sell well at about $4 per basket. Good native cabbage and Florida stock both sell at about the same price of $2 per crate and barrel. Southern spinach brings $2.50 per barrel if good. Kale about $1.50 per barrel. Native dandelions under glass $1.50 and better per box; best greens about $1 is the rule. Native lettuce pays well at $1.25 to $1.75 per box of 18 heads. Onions are plentiful for demand at $2.50 per 100-pound bag for native and New York stock. Foreign stock ranges from $2.50 to $3.50 per crate. Squash growers are very happy, as well they may be, to pocket five cents per pound, or at the rate of $100 per ton, for the last ends of their crop. Turnips hold about the same, $1.75 per bag for rutabaga, with Whitecap $3 per bag and White egg $1.25 per box. Old beets $1.75 per bushel, if in good condition; carrots $1; parsnips $1.50; radish $2.50 for fresh pulled.

Butter holds about the same, with supplies plenty and more coming, yet prices are fairly firm, ranging from 27½ to 29½ for best creamery and 24 to 27 for lower grades and storage stock. Cheese not plenty, not extra in quality, either old or new, and prices range from 15 to 20 cents per pound. Eggs have stood a slight raise for Easter trade, but will decline to the same former level or lower, as conditions are right for a large supply to continue for some time. Foreign invoices are much feared by dealers and make them slow to store heavily at present; 22 to 27 per dozen have ruled lately.

Wholesale meat prices, while high, do not seem at first thought to warrant the retail prices charged by the average market man, but in most cases these buy in cuts and not by half or whole carcasses and so pay several cents above quoted wholesale prices; yet a mighty good profit stays with them even at that. Best beef 14, others 8 to 12; lamb 12 for best, others 7 to 10; best veal 16, others 9 to 14. Dressed poultry 18 to 22, with broilers at about 25.

At Brighton stock yards trade slow, with plenty of stock on hand and some carried over from week to week, as dealers are not able to get prices asked in all cases, and hate to sell at no profit, or let the buyer get stock at his offer. A few good cows, of course, bring the price asked, some as high as $125 each, but much common stock is on hand, and some sell at $35 to $65. Oxen are scarce and high, a good pair calling for $300 to take away, and in most cases good ones are not for sale. Beef on hoof $7.50 to $8.50 for best, others $3.50 to $6.50 per hundred. Live hogs nine and better, dressed 11½. Small pigs very short, with prices $4 to $5 each. Sheep six cents per pound; lambs 8½; veal calves up to 9½. Cattle hides 12 to 14 cents per pound; calfskins 23.

The agitation in the grain market has given dealers the excuse they are always looking for to push up prices, and has been taken advantage of at present time by an unreasonable advance all along the line. Retail dealers sell cottonseed meal at $1.90 per bag; gluten $1.75; mixed feed $1.75; cornmeal $1.60 and oats $1.35. A. E. P.

We do not sell anything off our farm except butter, eggs, chickens and hogs, and the increase of our Jersey herd and some wheat when we raise more than 300 bushels. When we buy feed we buy in carload lots from St. Louis, Alton or Kansas City; 75 cents a bushel for corn is what we paid for last lot; were asked 79 cents last but we refused to buy. I paid $18 a ton for Alfalfa hay; $1.50 for shorts, white oats 46. We get 40 cents a pound for butter, until first of May. We sell from 90 to 100 pounds a week at that price, and 40 to 50 pounds at 30 and 35 cents at store. Eggs at present 17 to 20; veals 10 cents a pound; cows $60 to $80, some less some more. Holstein cows seem to bring the most money. I am sorry; I like the Jersey. Hogs eight cents a pound on foot; wheat 90. 1913 was a very dry year with us, only one rain in this locality in five months. Crops poor, except wheat; potatoes, oats, corn and hay, must all be bought. Drought and chinch bugs ruined our crops. Year before last we built a silo that gave us a chance to steal our corn from the bugs, otherwise we would not have got anything.

Bethalto, Ill. A. I.

Our staples are corn, oats, hay, rye cattle and hogs. Corn 60 to 65; oats 40; rye 60; hay $10 to $15; cattle $8 to $8.40 per cwt.; hogs $8 to $8.50; eggs 15; butter 26 to 28. C. B. P.

Albany, Ill.

I sell everything from the farm directly to consumers, and aim to produce only qualities and varieties to appeal to a high-class patronage. I have been unable to meet the demand for high quality produce. I base my prices on the retail prices charged by the best markets, and undersell them enough to make it well worth while for Summer people to motor 15 or 20 miles, in some cases three times a week, to obtain my produce. Of course the inducement is not only the price but the good quality and freshness. During the Summer my customers come here to buy; in the Winter I ship to them, chiefly by express. I find it difficult to get fair quotations, especially in Winter. In Summer I frequently charge twice the wholesale price, yet undersell the retail stores and peddlers. I consider THE R. N.-Y. the best in the field, and would be glad to help you at any time. FRANK REESE.

Monmouth Co., N. J.

Alternating Poultry Yards.

How many laying hens can be kept on a piece of ground 200x300 feet? I have divided the ground into two separate runs, one for Winter and one for Summer. What will be the best to sow in the runs, and when should it be sown? Can you tell me of a better plan? I intend to plow the runs in the Spring and Fall, and sow whatever green food will be the best, so they can have alternate runs and green food. H. A. P.

Delaware.

There is no limit, save foot room, to the number of hens that may be allowed upon a run of any given size. A small flock will quickly clean up a large area, and it is very difficult to keep green stuff in a poultry yard. Your plan of using yards alternately is a good one and will prolong the life of the vegetation. Here, wheat or rye sown in the Fall might be used; with you, Crimson clover might give better results. Another plan would be to sow a small yard to some rapidly growing stuff that would stand grazing, as Dwarf Essex rape, and give the hens the run of the other, only permitting them access to the green stuff for a half hour or so at night. These yards could be alternated each year. A few hens would quickly clean up a large area of new seeding in the Spring and you would probably have to use some Fall-grown grain if you wished to pasture it continuously for any length of time in the Summer. I can only make suggestions, which you will have to try out under your own conditions. M. B. D.

A Pulper for Beets.

A few weeks ago F. M. P of Connecticut, asked for a machine for pulping mangels for feeding poultry. F. M. P. wants to feed the green pulp in jars rather than let the hens peck at the beets. We had nearly 25 suggestions. The following seems most reliable to F. M. P. He thinks he can rig up his buzz-saw with a wide wood wheel with nails driven into the run so as to tear and pulp the beets.

"On page 275 F. M. P. wants to know how to get a machine to make beet pulp. This is how I did it. I had an old cast iron fly-wheel about 18 inches in diameter, happened to be heavy, about 50 pounds. First I fitted a piece of ¾-inch pipe for an axle or shaft to the wheel, with a crank on end of shaft, then I fitted a board on side of wheel cut round, exact size of wheel and bolted on wheel. Next I drove this board full of galvanized nails, fivepenny shingle nails, about three inches apart, and was careful that no two were on the same line as they revolved, next I set this on a box about 12 inches wide and 24 inches long, fastened axle to box so wheel would turn true. I built a hopper on side of wheel where nails revolve. This hopper must be built with care so beets will slide down to wheel and the nails will shred the beets fine and quickly. Almost everyone can make this kind of a shredder. Sizes need not be exactly like mine. I can shred a bushel in about 10 minutes, and altogether it is very satisfactory. J. S. K.

Suffolk Co., N. Y.

EGG-EATING DOGS.—I had them, and broke the habit by opening one end of egg in which a small quantity of red pepper was stirred with a stick, the hole covered with the flap from an envelope containing mucilage. Lay this where the dogs can reach it, watch and when he takes it press his jaws together to mash the egg. A sure cure. W. H. STOUT.

Pennsylvania.

THREE-YEAR-OLD LOUIS: "Oh, mother, what is this picture?" "That is a rhinoceros." "What is that thing on his nose?" "A horn." After a silence, "Mother, how does he blow it?"—Credit Lost.

FARM FOR SALE—61½ acres; good soil; fruit; 10-room house. HENRY R. STRAHLMANN, Spring Valley, N. Y.

EXCHANGE—"Princess" Reds, eggs, or milch goat for reliable light motor or incubator. GRIGGSVALE, Troutrun, Pa.

FOR SALE OR EXCHANGE—Iron-age two-horse cultivator, practically new, at half price. Want Disc Harrow. Box 82, Dunellen, N. J.

WANTED—A few bushels of pure Carman No. 1 potato seed; quote price and particulars. F. A. CORLETT, R. F. D. No. 1, Conneaut, Ohio.

TO EXCHANGE—Fine Chicago View Camera outfit, almost new, for Cream Separator. WOODBINE FARM, Hartstown, Pa.

PURCHASE ALFALFA HAY direct of the producer and save money. F. P. ERKENBECK, Fayetteville, N. Y.

FOR SALE—Hydraulic Cider Mill complete; in fine working order. F. L. SHELDON, Troy, N. Y. R. F. D. No. 1.

---

93 ACRES and 12 ACRES—Two acres in grapes. Inquire N. M. KISTLER, Emporia, Va.

FOR SALE—Chautauqua grape farm, 90 acres; splendidly situated; fine buildings; $2,000 down; liberal terms balance; description, photographs upon request. HARRY STANSBURY, Forestville, N. Y.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

MODEL POULTRY FARM—Successful business proposition, fully equipped with thoroughbred stock; 35 acres; capacity 3,000; large dwelling, mile from railroad; profits will return 20 per cent. on investment; $15,000, part cash. BOX 256, Beverly, N. J.

FOR SALE—Fine river plantation, 1,040 acres; deep-water front; soil chocolate loam in high state of cultivation; good buildings; two million feet timber; or will sell without timber; wild turkeys and other game plentiful. N. R. PALMER, Sweet Hall, Va.

FOR SALE—Farm in Piedmont, Virginia; 117 acres; half clear, well watered; new house, four large rooms; outbuildings old; orchard, apples; station and town 2½ miles. Write for further particulars. Address, BARGAIN C, care R. N.-Y., 333 West 30th St., New York.

DAIRY AND POULTRY FARM—40 acres; new nine-room house, hot and cold water; bathroom, telephone, etc.; three new poultry houses; hay, cow and horse barn; team good horses; nine fine Jersey cows, three heifers, four calves, 150 laying pullets, hundreds of young chickens, geese, ducks, etc.; all farm machinery, tools, wagons, incubators, brooders, etc. Price, $4,750; half cash. Fifteen minutes from railroad station and village. THE SUN FARM, DeLancey, Delaware County, N. Y.

Overland $950

Completely Equipped

With electric starter and generator—$1075.
Prices f. o. b. Toledo

Now is the Time —

WHEN bright little Miss Spring comes cheerfully bobbing into your midst and gruff Mr. Winter goes grumbling and sliding out of sight—when old mother earth is thawing out and inviting you and yours to stay and play out in the open — when every single road coming and going from your farm is automatically cleared by nature and opened up for a big spring business — when the days get longer and the sun gets warmer—when the welcome robins and tiny buds appear and the slush, snow and ice disappears—that's the time to get your new Overland and open her up to your heart's content. And you need it more than you probably realize.

What's more—your whole family needs it.

Think of Your Family

They, too, want to get out of their former small and narrow path. They, too, want to go hither and thither—seeing, learning, playing, working, enjoying, broadening and accomplishing.

For life can be just what you make it —dull, forlorn and narrow or just chuck full of everlasting fun and enjoyment.

Even work becomes light under the proper conditions. Remove the dreary drudge and you get light-heartedness in all of its efficient youth and glory.

That's what an Overland can do for you and yours!

"Yes"—you say, "but that costs a whole lot of money."

There's where you are wrong.

It doesn't cost a whole lot of money.

Do you realize how much automobile you get in an Overland for $950? Do you realize that it is a great big five-passenger touring car? That it has the power to take you wherever you want to go and that it is built to last for years and years and years.

A Big, Beautiful, Powerful Car

Don't confuse the Overland with those small dinky cars. Because our price is so exceedingly low people often class us with those small affairs. Our price is low because we manufacture cars on such a gigantic scale that we can make them more economically than anyone else in the business. This year we will produce 50,000 cars. Think of it! And that's the reason our price is 30% under anything on the market.

The Overland is a big car — a roomy car—a powerful car—a beautiful car—a comfortable car—dependable to the last degree.

In fact the mechanical construction of the Overland could be no better—regardless of price.

Then the Overland is right up-to-date in every respect. The body is finished in rich Brewster green—trimmed in highly polished nickel plate and aluminum. It has a graceful cowl dash. There are electric lights throughout—even under the dash. The motor is powerful, speedy, smooth and quiet. The wheel base is long and the tires are large. It is remarkably economical on oil and gasoline.

Right Up-to-Date

The 1914 Overland is beyond question the greatest automobile buy in the world. It has all the improvements, refinements, features and finish of a high priced car, yet costs but $950—which is 30% less than any other similar car made.

It is up to you. Spring is here. There are months and months of perfect automobile weather ahead of you and $950 put into an Overland will bring you a greater return on your money than you can get from any other form of investment.

There is an Overland dealer near you. See this car today. Or write for catalogue.

Vol. LXXIII, No. 4253. NEW YORK, MAY 2, 1914. WEEKLY $1.00 PER YEAR.

SHEEP THE COMING ANIMAL.

A Great Future in the Business.

DIMINISHING FLOCKS.—There are fewer sheep in the United States this year than there were last year. Last year there were fewer than the year before. Mutton consumption is on the increase, mutton production is on the decrease. Western States that have supplied sheep in great numbers are fast losing their free and cheap pastures and large flocks. It is a land of homesteaders. Dairying has taken the Eastern States in its grasp, and sheep are a relic of former days in farm practice. Is there anything of significance in this for the man who owns land? I think so. Let me venture the propheey that ere many years prime mutton will, the year round, sell in the same notch with prime beef and pork. In fact, for a long time mutton of the right age and finish on the right market is the highest priced meat. Often it has been said, and it will stand repeating, that a flock of ewes of the right pattern, well cared for, and raising lambs to be sold fat at an early age, will return a larger dividend on the investment than a well-cared-for dairy herd, and this herd can be considerably above the average, too.

COWS vs SHEEP.—At a farmers' institute one man said that he was the same as in the penitentiary with his big herd of cows. The same job every day, the same long hours, and not much more pay than if he wore the stripes. Another man told of his flock of ewes nearly all raising twin lambs, that sell from $10 to $12 per pair at weaning time. "The lambs do the milking," he said, "and I clean the stables when I get ready, and market my product when it gets fat." These might have been extreme cases, but there was food for thought in both.

CONDITIONS REQUIRED.—To flourish in any business the disadvantages must be overcome and all natural advantages be made the most of. Any man can keep sheep, and at a profit, if he has good business sense and will apply himself, but unless he has a leaning toward the flock his efforts will not bring coin like that of the natural flock-master. This should not be marked up against the sheep, as it is true of any enterprise. The farm must have some equipment for the sheep's care, but it need not be expensive. With a wise owner they will live and thrive in the most common and home-made quarters.

GOOD FENCING NEEDED.—One drawback in starting sheep-keeping on the farm where they have long been absent is lack of fences. Two or three wires tightly stretched will turn the farm horses and dairy herd, but not the sheep, and a flock running at large on a farm is not good business. They love and devour young trees, berry and grape-vines and roses, and a few hours of liberty in the young corntield will work havoc. Give them credit for this, because it is this same appetite that prompts them to eat weeds and bushes and many things that might go to waste or be in the way of better farming. There is only one right way to fix the enclosure for sheep, and that is to fence so that there will be no first time for them to get out. Crawling under or through or jumping over fences is easily learned and never forgotten. I have seen old ewes as expert as goats at these tricks. Plain woven wire has no equal as a sheep fence, and it need not be high if the sheep have not learned to jump over poor fences. We have safely fenced flocks with a 26-inch hog fence. A barbed wire stretched above this makes doubly sure, and one more wire will turn all other stock.

BUILDINGS.—Shelter with dry footing and good roof is more important than well matched siding and closed doors and windows. Keep them dry and well fed and cold weather need not be feared. Of course very young lambs must not be exposed to cold blasts. We have raised many lambs in zero weather in plain sheds by putting a blanket on the youngster. This sounds foolish and bothersome to some folks, but it is easily and quickly done. Fresh air and pure water both Winter and Summer help to make mutton. Rains in Summer do no harm. It is the wet fleece in cold, windy weather that makes the sheep lose flesh and get catarrh.

THE DOG NUISANCE.—Dogs are to be reckoned with in sheep raising. It is a sad state of affairs when the cur dogs of our land hold such sway that many men stay out of the sheep business from fear that profits will be torn up and scared away in one night. Would that we had laws enacted and enforced compelling every dog owner to keep his dog as he does his cow or horse. If a dog is worth owning he is worth keeping in hand. What would we think of a man, or rather what would we do with him, if he had a ram galloping along the road after him and hopping over the fence into every one's yard or field as he went to town? Dog-proof fences can be made by using woven wire fence four feet high staked close to ground, and a barbed wire stretched above it. Bells offer some protection. A bell on every fourth or fifth sheep if the flock is large, and on every sheep if it is a small flock, will frighten some dogs, and the bells will attract some one in time to save the sheep.

A FLOCK OF SHEEP ON A PENNSYLVANIA ROADSIDE. Fig. 271.

Use small cow bells that will make some noise and not little toy sheep bells.

DISEASES AND PARASITES.—Another trouble to face is internal parasites, stomach worms and nodular disease that appear when sheep are pastured. Years ago these troubles were called paper-skin because of the bloodless looking skin of the affected sheep. Happily prevention is easy and cures are possible. Prevention is the proper thing. Keep tobacco where the flock can always get it. Tobacco stems are cheap, and when chopped up with fodder or silage cutter lambs will eat it as soon as they will eat anything, and so far as I know lambs that have always eaten tobacco are never troubled with internal parasites. These troubles just enumerated, and some minor ones that we can take up later, are more than offset by the advantages to the everyday farmer of keeping sheep, perhaps in a moderate way. Their care and feed bill need not be so great, and the income is always welcome. R. A. HAYNE.

Jefferson Co., Ohio.

WESTERN ALFALFA CULTURE.

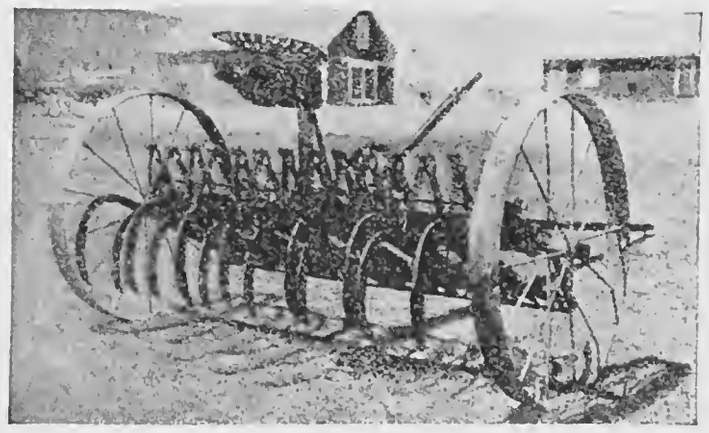
Some of the experiment stations are issuing excellent bulletins on Alfalfa culture. In the West this crop is the leading one. It is coming so that most of the other crops are based upon Alfalfa. The Kansas Station at Manhattan, in Bulletin 197, gives a good summary of Alfalfa conditions in that State. It seems that in Western Kansas Alfalfa may be planted in drills or rows, and cultivated like corn or sorghum. In the drier sections of the State this row cultivation is a success, and such Alfalfa usually produces more seed than when it is broadcast. It appears that the Alfalfa should be cut for seed when about half of the seed pods are brown. Many farmers cut their seed too soon, which results in a crop not as strong or vital as it should be. While Alfalfa has a very deep tap root, and is supposed to pump up water from the lower soil level, it leaves the ground very dry after a full crop. In Kansas, when the Alfalfa is to be followed by another crop, Kaffir corn or sorghum is recommended. The Kaffir is known as a drought-resisting crop, and will do better on the dry soil than corn or most other crops. These things are of great importance on the dry plains, and especially in a season of drought.

The Kansas Station says that when the Alfalfa is grown for hay, and the hay is sold, comparatively little plant food is added to the soil, while large quantities are taken away. The advice in Kansas is to feed the Alfalfa on the farm, and thus get it back on the land. The point, however, is that continued exports of Alfalfa away from the farm will run the soil down in spite of the fact that we have all been taught that Alfalfa is a soil renewer. In the Eastern States it is often very much more businesslike to raise Alfalfa and sell the hay, since it brings a large price in the market. Where this is done the point is to use large quantities of phosphoric acid and potash, and fair quantities of nitrogen in the form of chemicals, to keep up the supply. Where this is done selling Alfalfa may prove a good business in every way. In the Western Alfalfa fields it has been found desirable to scratch or work over the surface of the ground in Spring. This bulletin contains pictures of two machines, or tools used for this purpose. They are shown at Figs. 272 and 273. As will be seen, one looks like a hayrake, but with much heavier spring teeth than those found on the rake. The other tool is an ordinary spring-tooth harrow, with small sharp tooth attachments, which scratch and tear the ground without digging it too much. The latter type was recommended by our old friend John M. Jamison of Ohio, who often wrote us about it.

NOTES ON GRASS AND ALFALFA SEEDING.

In the Summer of 1911 I had 19 acres of potatoes. Of these, about 10 were early ones. These potatoes were kept clean, and after being dug with the digger with a little fitting, the land was in excellent condition for any crop which I might wish to plant. There had been potatoes on the piece of which I am going to speak, the previous year also, and it had had an application of one-half ton of high grade fertilizer to the acre, each year. After I had removed the first 3½ acres of potatoes, I had the piece thoroughly fitted with a spring-tooth, without plowing, and about August 20 I sowed it. The first three acres were sown to Alfalfa, and the other half acre to grass as in the Clark method. The land is what is known as Ontario fine sandy loam. This is a medium soil, grading between a sandy loam and a clay loam. I sowed 25 pounds of Alfalfa to the acre, mostly broadcast. As an experiment, I put in one bout with the hoes (double disk) of the drill. This with a previous experience, showed me that the drill will not do satisfactory work with such small seeds, without press wheels or some other means of regulating depth, for the Alfalfa drilled in came up unevenly, and was entirely missing in those spots where the soil was extra mellow. On the strip sown to grass, I put one half bushel of Timothy and Red-top per acre. As I did not have quite enough clear grass seed, I used a little that was mixed with Medium clover.

It rained that same day, and both pieces came up very quickly. The Alfalfa did well and the grass soon formed a lawn. One end of the piece is a limestone soil, and is naturally well drained, while the other is more clayey, and more retentive of water. It turned out to be a hard Winter on seed-

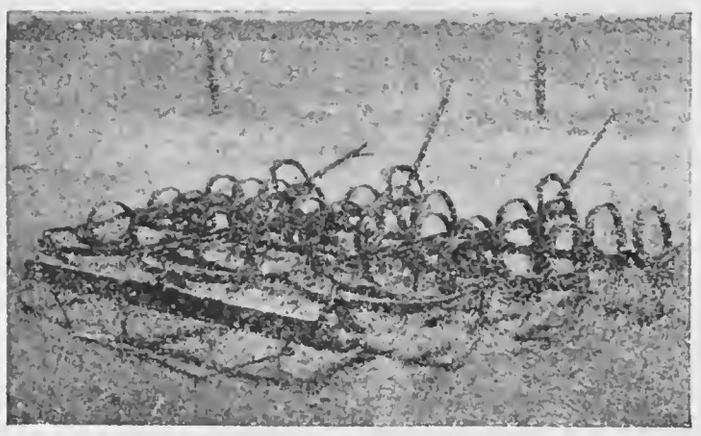


A Western Tool for Working Alfalfa. Fig. 272.

ing, and the Alfalfa on the wetter end killed out, but on the other end I got three good crops. Last year, I had the heaviest piece of hay on part of this piece of Alfalfa, that I ever cut. This was on the part that had the deeper soil. The dry weather cut down the yield on the shallow soil some, and made the second and third crops short.

The one-half acre of grass, which was put in according to the Clark method, except that the cultivation was applied to a valuable crop of potatoes, instead of to a bare field, yielded nearly two loads. As I had no scales, I cannot state the yield in tons, but we estimated the loads to weigh nearly 3,000 pounds. The rack was eight by 14 feet, and the standard about six feet above the rack. The loads were laid out over the sides of the rack a foot on each side and were perhaps a foot above the standard. The hay was short and fine, but very thick. I think a fair estimate of the yield would be five tons of field-cured hay per acre.

Next to this half acre, after removing the potatoes, and fitting as before, I sowed wheat and four quarts of Timothy per acre. This was sown about September 20. The wheat made a pretty good growth, but Winter-killed. I cut the piece for hay the following season. There was so little wheat left alive that it did not materially influence the yield. This piece of three acres yielded over nine loads, such as were described above. The hay was much taller and coarser than the other and was heavier. We thought that four tons per acre was a fair estimate for this piece. It will be seen that although sown a month later, on land which was, if anything,



Spring-Tooth Alfalfa Cultivator. Fig. 273.

poorer, four quarts of seed yielded nearly as much as one-half bushel of mixed Timothy and Red-top. The quality of the hay on the thinly seeded piece was much the best.

Early in the Spring, before I knew that the wheat was all killed, I seeded the piece with the wheat on it, with Red clover, Alsike and more Timothy. In the Fall, the whole piece, including the heavily seeded half acre, was top-dressed with 10 loads of manure per acre, applied with a spreader. The half acre was spread first, followed by the rest, the manure being applied as made.

In spite of the advantage which the half acre had, by being spread two months earlier than the average of the rest of the piece, it failed to yield as well as the rest of the piece in 1913. There was a good lot of Alsike in the hay where I sowed it the year before, but the Red clover and the extra Timothy did not show up to any extent. The whole 3½ acres were harvested at one time, no attempt being made to keep the two parts separate, so it is impossible to state the comparative yields, but the half acre had not more than from one-half to two-thirds as good a crop as the rest. The total yield was a little over 10 loads. The dry weather seemed to hit that which was heavily seeded, much worse than the other. It is impossible to say how much of the extra yield was due to the Alsike, but I think that the thinly-seeded piece would still have been ahead had there been no Alsike. In my opinion nothing is gained in sowing more than one peck of Timothy to the acre on perfectly fitted soil. Strange to say, the Red clover that was sown in with the grass on the half-acre piece came on quite well in 1913 and thus offset the Alsike on the other piece to a certain extent.

In sowing grass seed with my grain, I have usually used eight pounds of Red clover (Medium) two of Alsike and 10 of Timothy. This year my Red clover as well as that of my neighbors, seemed to be injured in some way so that there was scarcely any in the hay. The Alsike, however, did very well. I think that a few pounds of Alsike is pretty cheap insurance, and I shall increase mine to three or four pounds to the acre this year.

Adams Co., N. Y. ALBERT H. DE GRAFF.

AN OLD FERTILIZER FAKE.

Every now and then some one comes telling about the so-called "new mineral fertilizer." Sometimes it is a tale of woe from some person who paid for the stuff and found it worthless, or at least of no value to his crops. Or it may be some one who has for the moment been carried away by the fairy tales related about this stuff. They are on the point of investing their good dollars, but before they start they want to know a little more about it. We had one case where a company owning an orange grove in Cuba actually bought several tons of this material, not only receiving little or no plant food, but actually paying more than the price, and unable to obtain a rebate to which they were clearly entitled.

It is remarkable that this stuff can be kept before the market so long after the repeated exposure concerning it. They seem to do these things very well in Florida; would that they could run the land shark and the town lot boomers through the mill as they do fertilizer frauds.

In the last Florida report we are told how the commissioner, in order to be sure of his ground, obtained sample after sample of this new mineral fertilizer and analyzed it carefully. The first sample contained in one full ton exactly 18 ounces of phosphoric acid, of which nothing whatever was available, while there was not even a smell of available potash in the whole ton. In order to be sure, he took another sample. This one contained three pounds of phosphoric acid in a full ton, but there was not even a smell of available potash. Nothing like being sure, when you want to do a complete job with a fake, so he took a third sample. This one contained the marvellous amount of 14 ounces of phosphoric acid, in one full ton. Wonderful to relate, this sample actually contained one-third ounce of potash in the full ton.

You might think that would settle the matter, and it did, so far as the Florida commissioner was concerned. He issued a statement to the public condemning this new mineral fertilizer as a fake, and notified all dealers or agents that if they offered it for sale, they would be subject to the penalties imposed by the Florida law. That is good business, a model which many of our State commissioners might keep in mind. But did it shut off our friends this mineral fertilizer company? If their fertilizer contained as much available plant food as they could show of guff and nerve, they would have the most remarkable fertilizer compound that the world has ever seen.

The average man would do his best to forget mineral fertilizer if his scheme were shown up in this way, but these fellows are apparently working poor old Uncle Sam in their efforts to sell 15 cents worth of plant food at about $16. They are going direct to customers, hoping in this way to escape or get by the Florida law. The United States Government ought to take this matter up, and help the Florida authorities to handle this stuff.

It is hard to understand how intelligent men, some of whom have grown crops all their lives, could be induced to fall for such a proposition. One would think that the very stories told by these people would act to kill them off, but apparently there are still plenty of people in this country who think they can raise potatoes on guff and fairy tales.

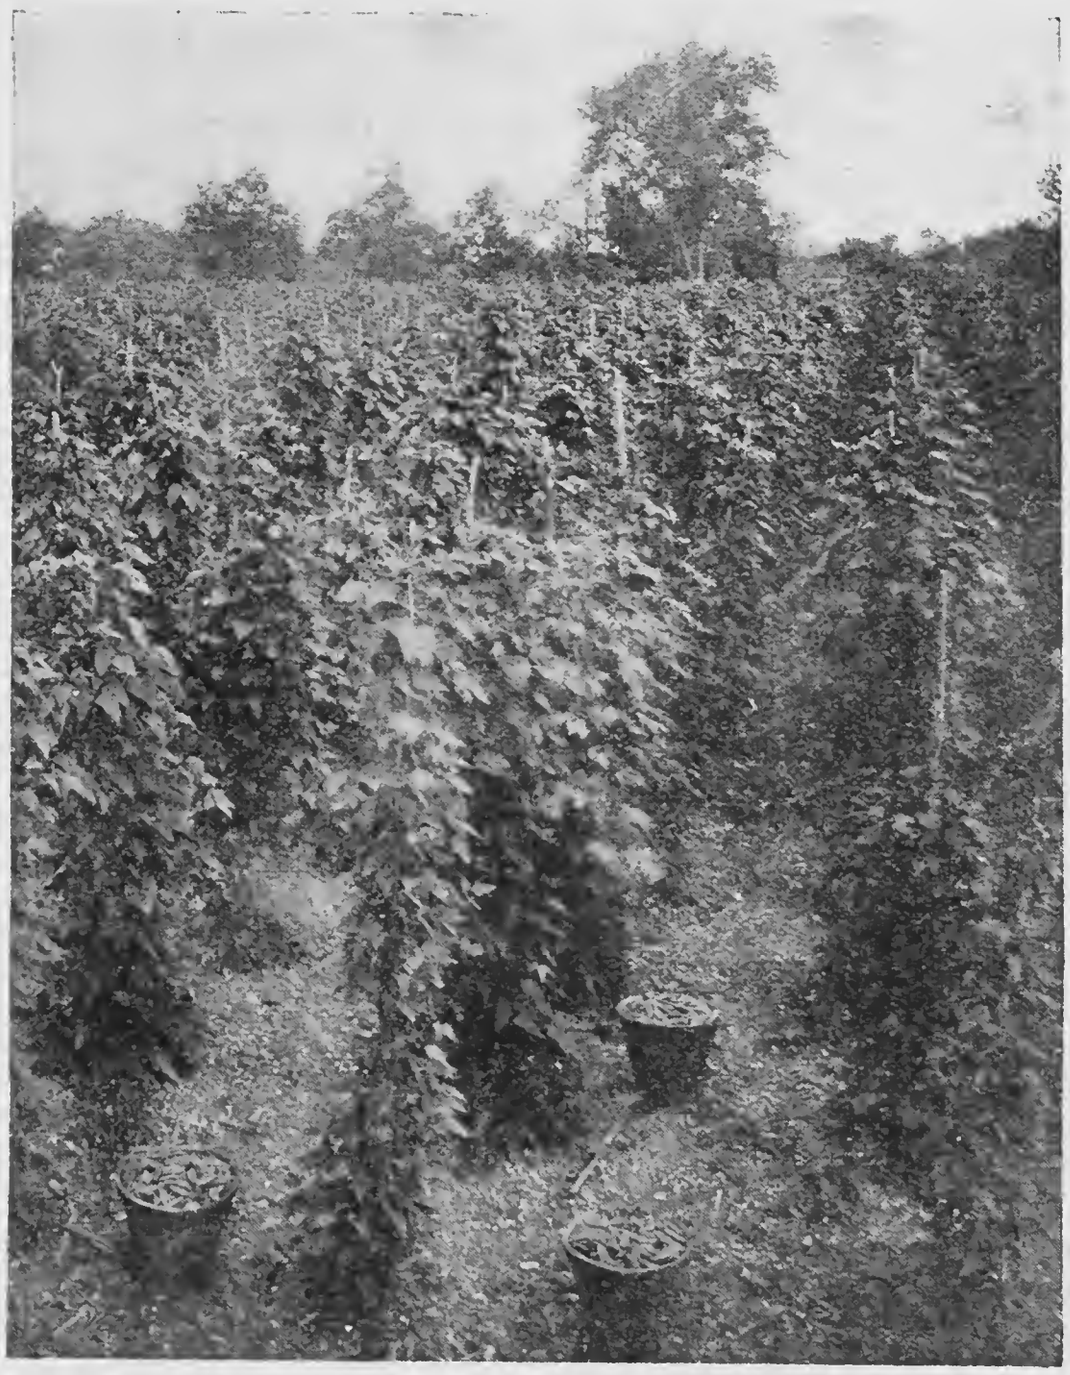
LIMA BEANS FOR MARKET.

I intend to plant 3,000 hills of pole Lima beans. Will you tell me how to care for them, from the preparing of the soil to gathering? My ground is quite high; I have plenty of stable manure. I. L. B.
Pine Bush, N. Y.

In former years we have grown a good many pole Lima beans, and our method was to mark out the ground in checks, with hills four to five feet apart each way. We furrowed out rather deep one way of the field, and then manured the hills before the poles were set. The best manure we could find for Limas was strong hog manure. Stable manure came next. A shovelful was placed in each check or cross mark and the hills were made up. On small plots the hills were made up by hand with large hilling hoes. On large areas a sweet potato ridger or a one-horse plow run around each row will make a quick job of it. After hills were made the poles were set. Ordinary-sized poles can be set quickly by using a crowbar to make the holes. We have also used wires for pole Limas. Strong posts were placed from 25 to 50 feet apart across the field and two strands of wire stretched along them, one strand being about 18 inches above the ground, the other 3½ to four feet. Some prefer the wire, some the poles, the preference being governed largely by the question as to which could be secured the cheaper.

Beans are planted here about April 25 to May 10, and we place each bean in by hand, eye down. Cultivation starts as soon as the young plant gets started, and on high ground it is essential to cultivate thoroughly throughout the entire season. When the beans began to send out runners they were tied to the poles with soft cotton twine. This had to be done about three times, and it was quite a job. In fact the pole Limas always seemed to be requiring attention of some kind, and this year we shall not have a single pole on the place. We did not last year, either, and we were not a bit sorry. Our bush Limas tasted just as good, sold as high, yielded as well and brought us more per acre than we ever secured from the poles, and with far less work. In other words, we have dropped the pole Limas and substituted the bush Lima. The Fordhook Bush Lima has made this change possible. It comes early and some years lasts the entire season. The pods fill out well, and the price is usually higher than for the flat-podded beans. It is also a good yielder. The bush beans are grown in rows four to 4½ feet apart, and the plants are 12 to 18 inches apart in the row. We furrow out with a one-horse plow; distribute the manure in the row, ridge up and plant. Beans are placed in by hand as for pole Limas. After that it is simply a matter of cultivation and picking. Italians or childr are glad to do the picking for 10 cents a ⅝-bushel basket. TRUCKER, JR.
Gloucester Co., N. J.

PLANTING POLE LIMA BEANS "EYE DOWN." FIG. 274.



A FIELD OF POLE LIMAS AT PICKING. FIG. 275.

HOW I CAME TO START IN THE CANNING BUSINESS.

PART II.

A LESSON FROM LOW PRICES.—For several years I lived near two towns, each of which had a factory for canning tomatoes. Nearly every farmer who lived near enough raised from one to five acres of tomatoes. The superintendent of one factory was a friend of mine; also I knew many of the operatives, and often while waiting to unload, I would go through the factory to watch the different processes the tomatoes went through. In that way I obtained a general idea of what was necessary to be done, which helped me much later, when I started for myself. Three years ago we moved to our present location and tried fruit-growing and trucking for the near markets, eight and 12 miles away. Every season just when we had the most of every crop, the price would drop so low that it did not pay to cart the stuff to market. Often I have seen tomatoes as low as seven cents per 16-quart basket; wax beans five cents per bushel; Limas, shelled, five cents per quart; peas, 40 cents per bushel. I did not see that these low prices benefited the consumer any, for as soon as the market closed, the storekeepers put the retail prices as high as they liked, regardless of what the farmer received. After two seasons of this, I began to look about for some means to get more for our crops, so I talked the matter over with several storekeepers, and found them inclined to think very favorably of the idea of home canning if I could produce superior quality. They were willing to pay more than for regular factory goods. This higher price is necessary to make it pay, as it costs more to put up by hand than by machines, and the cans cost more in small quantities. Next I got all the reading matter I could obtain on the subject, which was very little. From the very first I made up my mind to put quality first. How well I succeeded I will leave it to the Hope Farm man to say, as he has tried them.—[The goods were excellent.]

GLASS OR TIN CONTAINERS.—The glass jar is largely used at home, and although growing in favor for a certain class of trade, is not used very extensively commercially on account of weight and breakage. The goods show up much better in glass, and if delivered in person to the consumer, would no doubt prove very satisfactory. If the jar is to be returned, by all means charge for it when delivered, and rebate when jar is returned, otherwise I find the loss is too great. The tin can is the container used almost entirely in the commercial canneries. To-day the solder necessary to seal the can is attached to the cap. Also in many canneries the open top or sanitary can has taken the place of cap and hole cans. The open can top is closed by a machine called a double seamer. No solder is used except on the side seams on the outside. These cans are too expensive, unless on a large scale, on account of the machinery. A recent improvement in tin cans is the enamel-lined can. These cans are best for such articles as raspberries, cherries, plums, beets, rhubarb, etc., which contain acid, and when packed in ordinary cans lose their color. Tin cans are of many sizes and shapes, but there are certain styles, known as Standard No. 2 cans, with 1½ or 1⅜-inch opening. This is the size usually used for string beans, corn, peas, Limas, etc. No. 3 cans are Maryland standard or Jersey standard, according to the locality. The Jersey is the largest; 2 1-16 or 2 7-16 inch opening is right for either of these.

THE OUTFIT.—In ordering an outfit, it is necessary to give size of the opening you are going to use, so capping steel will fit. I had some trouble with mine, until I sent a cap to factory and had steel made right size. A good outfit for a beginner would be a home size steam pressure boiler or process kettle, with rack for holding cans; a No. 7 fire-pot, burning gasoline, for heating irons, two capping steels (two sizes) to fit caps, two tipping coppers, a galvanized iron boiler for scalding, blanching, etc.; a rack to fit, for holding tomatoes while dipping; a wire basket for blanching; a pair of can tongs, knives, buckets, a table to work on, a can of flux or some acid and zinc for making the flux, and some sal ammoniac for cleaning and retinning. This outfit will cost about $40 to $45. The cost of cans will vary with style and size, also locality will make a difference, on account of freight, but should not exceed $25 for No. 2 cans, $30 for No. 3 cans, including caps, labels, cases, etc. I do not know of any can company that will sell in lots of less than 500 of one size and style. The price is the same per thousand up to 2,000, and $1 per 1,000 less for 2,000 or more up to a carload.

FILLING.—A can of food should be as full as it can reasonably be packed and processed without injuring either the quality or appearance of the contents. All food packed in liquid should be filled to within one-half inch from top, and when free liquid is present, should cover the solids. A can of corn, beans or peas when opened and found to be one inch from top would be considered slack filled, and would be hard to sell at a price that would show a profit. Cans should be tested for leaks as soon as removed from process kettle. With a small stick tap on the can while hot. If the result is a dead, dull sound the can leaks; if clear and ringing, the can is tightly sealed. Another method is to place can in cold water. If bubbles arise, the can is not airtight. The standard packers' can has a hole in top for filling, and is furnished with a cap (to which the solder is already attached) for closing. In ordering these cans, always specify solder hemmed caps. After filling, place the cap over the opening, apply the soldering flux, press the hot circular capping steel on to the solder until melted, hold cap down with the iron rod, raise the steel an inch until solder is set. Apply a little flux to the vent hole in center of cap, touch a drop of solder to it with the tipping copper, and the can is sealed. Beginners will find many more things to learn, such as retinning capping steel and coppers, formulas for making flux and for cleaning, formulas for processing, blanching, exhausting, cooling, syrups, etc., to write all of which would make this article too long. WM. H. PARSIL.

True Value of Beardless Barley.

Is beardless barley as good for general crop as two-rowed barley? I can raise as much barley per acre as I can oats, and can use it to feed all kinds of stock, but object to barley with whiskers.

Wayne Co., N. Y. G. A. C.

Beardless barley yields from 15 to 45 bushels per acre, with us here in Central Ohio. On the same ground, we would expect 30 to 50 bushels of oats, and probably 20 to 50 bushels of bearded barley. A good many farmers are now growing beardless barley in preference to oats, because while the yield is a little less, the price is usually higher, and they figure that it pays them better. The real benefit though, from beardless barley is found in its qualities as a nurse crop. We began growing it about 15 years ago; up to that time we had been using oats, usually cutting them for hay. After one year's experience with the barley we discontinued the oats entirely and we have never yet found the equal of beardless barley for a nurse crop. Bearded barley, in our opinion, would go between the beardless and oats in its value as a nurse crop. We have no other grain that has shown itself anywhere near the equal of the beardless barley in this respect. It does not stool out as vigorously as oats, neither is it as leafy, consequently it shades the ground less. Its straw is stiffer than that of either oats or bearded barley, and it requires decidedly fertile ground in order to make it lodge. It does not grow as tall as bearded barley and therefore shades the ground less. It matures with us about July 12, thus enabling the grower to harvest it for grain if desired, and still get the crop off before the young clover or Alfalfa was suffering any. It also makes good hay. About half the time we cut ours for hay instead of grain, and all kinds of live stock eat the hay and relish it. CHAS. B. WING.

Ohio.

Water Cress.

Will you give me information about how to raise water cress? I have a brook on my farm. W. A. B.

New York.

The method most commonly employed for the establishment of this well-known aquatic plant is the sowing of seed at or near the source of the stream, which is carried by the current and deposited along the margins of the brook, where more or less of it will find lodgement in favorable places, the results bring scattering patches of the plant extending over a long reach of the stream. This makes the gathering of it sometimes quite tedious, if not difficult. The better plan is to sow the seeds in beds along the brook, as the crop is then brought within the confines of a limited territory that is at all times under control and easy of access for the gathering of the crop. When the stream runs through land that is comparatively level, the beds are easy of management, and are made by excavating the earth in strips four or five feet wide and about the same distance in length, when the water is, we will say, 14 inches deep. The bed should be excavated to a depth of 10 inches. Water cress is always found growing best naturally in rather shallow and clear water that has but little current and that has a gravelly or sandy bottom, so that in the preparation of the seed bed it is well to provide an environment that is as near nature as possible.

After this bed has been dug out to the required depth stakes should be driven down at each side of the excavation along the margin of the brook, and a piece of plank fitted across the entrance to keep the water from flooding the bed and possibly washing away the seed. Just enough water should be allowed on the beds to keep them moist until the seed germinates, which it will do quite freely in a few days. When the tops of the beds are fairly grown with young plants, more water should be let on; this is to be done in regular graduation as the plants develop, until they reach maturity, when the planks may be removed from the inlet to the beds as the cress will now be able to take care of itself. When a number of beds are formed an alley-way three or four feet wide should be left between them. Sow the seed about April 15.

Along streams where cress is growing wild, plantations may be very easily established by setting the plants eight to 12 inches apart each way. When plants are available it will be an easy matter to form new beds, as the plants transplant quite easily and grow readily and very rapidly under proper conditions.

K.

Stocking a Fish Pond.

What kind of fish is best to put in a pond fed by a spring brook? It has some small minnows, was once a trout brook, but is minus trout now. I have dammed the brook and it covers an acre or more, is from four to eight feet deep. I was thinking of stocking it with Wall-eyed pike, or would crappies or bullheads be better suited to a place of this kind?

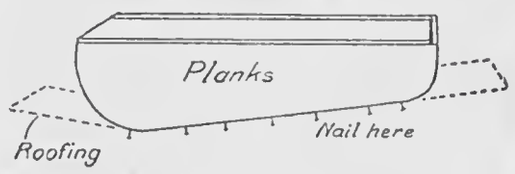
North End, Pa. A. L. E.

This pond is scarcely in shape to use for fish. Before stocking any water with fish provision must be made for feeding, otherwise the fish will not propagate, and while a limited number might live under such conditions they would remain immature and gradually disappear. This pond could no doubt be made suitable for bullheads, Yellow perch or even Black bass by propagating minnows in the brook above the pond and planting such vegetation as will provide plant food for the fry. Your pond probably has a mud bottom, which is suitable to bullheads and perch, and while bass can live in such a pond they prefer gravelly bottom with rocky spots for protection from water snakes and other enemies. Any of the following plants, which can be procured from seed houses at small cost, will grow and spread readily in such a pond and provide food and shelter for the young fish: Potamogeton, Ludwigia, Sagittaria natans and Vallisneria—all of which are oxygenerators, and should be planted in the shallows along the edges of pond. With a proper balance maintained and water temperature running from about 50 to 65 degrees in Summer it would be suitable for perch and bullheads, and probably bass. Such a pond could be used for the propagation of goldfish, and probably return a handsome income on the investment—and in this case you would need no minnow supply, artificial food in small quantities being used. Every Fall the pond could be drained and about $50 worth of young fish sold in a ready market. The cost of raising goldfish is infinitesimal, they make a pretty showing, are hardy and increase rapidly. Goldfish, unlike other species, enjoy constant sunlight, and the less shade around the pond the better.

H. L. H.

An Easily-made Mortar Box.

A handy mortar box may be easily made by taking two planks of equal length and from eight to 12 inches in width. These should be rounded at the two lower corners similar to the runner of a flat boat. Then take a sheet of steel or galvanized roofing, nail it to the



CONVENIENT MORTAR BOX. Fig. 252.

planks, which are used as the sides. The planks should be sufficiently long so the sheet of roofing will extend from one end to the other and cover the ends. The mortar box need not be heavy and the rounded bottom at the ends makes it convenient because of the absence of the corner at either end. A neighbor has a mortar box of this sort and it has made good, for it is continually loaned out in the community. Every farmer should have a mortar box for mixing cement, and this is as easy a way to make a serviceable one as has come to the attention of the writer. W. J.

MRS. SPENDERS: "Oh, John, I saw a sign in Bargen & Co.'s window today that reminded me of what I am most in——" Mr. Spenders (interrupting hastily): "I, too, saw a sign in their window that reminded me of what I am. It reads: 'Reduced to 49 cents.'"—Philadelphia Press.

"RAIN-TIGHT" RUBBER ROOFING

is the kind you can put on your buildings and forget it—you will not need to think about that roof the rest of your life. You will never be reminded of it by water coming through and perhaps doing more damage to the contents of the house or building than the original cost of the roof. It is made of Trinidad Lake Asphalt—the standard Asphalt of the world. It is as near indestructible and everlasting as any roof can be.

Remember the so-called "cheap roofings" that must be repaired and replaced frequently are dear at any price. You will save money, trouble and eventually expense by buying **"Rain-Tight"** at the start.

Our brand of **"Perfect Roofing"** is the same as **"Rain-Tight"** with mica flakes added to the surface which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

Perfect Rosin Sized Sheathing and Perfect Tarred Felt are Best for Sheathing Purposes

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us today

HEADQUARTERS FOR FARM SEEDS

Inferior Black Walnuts.

For the past two and in some cases three years nearly all Black walnut trees in this vicinity have borne a large percent. of worthless nuts. Trees noted have been of all ages and in different soils. Some people claim trimming will do it, but that does not stand proving, because some of mine have never had a limb removed. My vigorous trees on heavy ground have a great many young shoots on the inner limbs. Is it advisable to trim these off, and can you suggest anything to improve the nuts? H. H. A.

Millville, N. J.

It is quite probable that the cause of "worthless" walnuts referred to is either lack of proper pollination or droughts that have prevented normal development. This tree is native to many parts of New Jersey, and has no disease preying on it or the nuts, so far as I know, unless it be an insect that in some places infests the hulls. I have seen their larvæ in the hulls of walnuts in Ohio and elsewhere ever since I began to gather the nuts for eating but I have not noticed that they had worthless or inferior kernels. Pruning off some of the branches would not injure the nuts on those remaining. As a rule there is no need of pruning walnut trees after they have once been headed at the right height and kept from making forks that are likely to split when the trees get large. I would think the sprouts referred to will not make objectionable branches but if they should show that they will do so any such should be removed. Good, deep, rich soil is what our native walnut trees or any of the foreign kinds need and if they do not have it supplied naturally the soil should be enriched. A heavy coating of old rotten trash is excellent and if there is animal manure in it so much the better. I have had fine success with this treatment for pecan trees.

H. E. VAN DEMAN.

Quick Tank Filling.

I have found that about two working hours out of every 10 have to be spent in tank-filling, keeping the team and two men idle. To prevent this waste of time I have installed a centrifugal pump, which throws 75 gallons per minute. The water is obtained from a spring and has to be raised about 10 feet. We are fortunate in having electric power on the farm, and have run a wire a short distance to the spring. One of our neighbors has solved the problem in another way. He has elevated a large tank which he fills with a gas engine. The spray tanks can be filled from this in four or five minutes by means of a hose.

Wayne Co., N. Y. F. W. CORNWALL.

Transplanting Large Cherry Trees.

Will you advise as to moving several sour cherry trees, about 15 years old, and five inches in diameter at the base? Is there a fair chance of their living if carefully handled? E. F. D.

Billerica, Mass.

Transplanting trees of this age and size is nearly always attended with more or less risk, particularly fruit trees, and before removing them to new quarters, they should have a season's advance preparation for this important and perhaps critical event. If this is properly attended to and the work of removal and transplanting carefully done the chances of their living will be greatly enhanced. This Spring take a spade and dig a narrow trench all around each tree five or six feet in diameter, cutting off all roots running in a horizontal direction and carefully pruning the bruised and broken ends, going deep enough to get all horizontal roots, after which fill the trench with soil. This severing of the roots will force the tree to make myriads of fibrous roots running in every direction through the ball of earth about the tree. Next Fall or Spring the removal may be made, and should be done with as much soil adhering to the roots as it is possible to handle. The hole to receive them should be dug at least one foot larger in every way than the ball of earth attached to the tree, and filled in to the proper depth with good top soil, and this filling in around the roots should be of good rich soil. Care must be taken that all cavities under the tree are filled and the earth well firmed around the roots as filling in progresses. If these instructions are carefully followed, the chances of success in this work will be greatly favored. K.

Cadillac Standard of the World

How much should an automobile weigh?

Suppose that railroads should offer you as an inducement to trust your life in their hands, the argument that the weight of their rolling stock had been reduced to the lowest notch.

Suppose in the locomotive, they make the boiler wall so thin and so light, that it will barely withstand the normal pressure for a limited time.

Suppose they make the trucks, the wheels, and the axles barely strong enough to support the engine under the most favorable conditions.

Suppose they make the connecting rods barely strong enough to turn the wheels.

Then, going back to the cars, suppose they make the trucks, the wheels and the axles no stronger than just enough to carry them a few thousand miles.

Suppose they make the frame barely strong enough to support the body of the car.

Suppose they make the body barely strong enough to hold together.

Suppose they reduce the weight of every vital part to the lowest point.

Would you trust your life in the hands of a railroad which offered you such inducements?

Safety demands strength.

Strength demands material.

Material means weight.

If these be true, then:—

Absence of weight must mean absence of material.
Absence of material must mean absence of strength.
Absence of strength must mean absence of safety.

These things apply, whether you have in mind railroads or automobiles.

How much is your safety worth?

Cadillac materials are selected for their adaptability and fitness for the functions and duties which they must perform.

The designs of the various parts are adopted only after they have proven themselves to embody liberal factors of safety.

The Cadillac car will appeal to you because of its strength and its security, rather than upon the basis of lightness.

The Cadillac will appeal to you for its comfort as the luxurious Pullman appeals to you in contrast with the light-weight flimsy coach.

The Cadillac will appeal to you for its smoothness and steadiness in running, as the majestic liner is in contrast with the light weight barque in a choppy sea.

The Cadillac will appeal to you because of its sturdiness and its endurance, rather than upon the basis of fragility and impermanence.

Because of its strength, because of its enduring qualities, the Cadillac is an economical car to own and to operate, day-in-and-day-out and year-in-and-year-out.

The Cadillac is economical in fuel.

Hundreds of 1914 Cadillac users are averaging from 15 to 18 miles per gallon of gasoline in every-day service.

Special test runs have been made showing more than 22 miles per gallon, but this cannot be taken as a criterion for the average user.

In the recent test by the Royal Automobile Club of Great Britain, which won for the Cadillac the Dewar Trophy, the 1914 car averaged 17.17 miles per gallon for 1,000 miles over give-and-take roads—in spite of frequent stops and starts in testing the electrical cranking device.

It consumed less than one gallon of lubricating oil in traveling the 1,000 miles.

Hundreds of users are averaging more than 5,000 miles on tires. Some users are reporting from 6,000 to 8,000 miles and even more.

We believe that in tires, fuel and oil, the 1914 Cadillac will average more mileage than any car which approaches its efficiency.

Because of its standardization, because of the interchangeability of its parts, because of its sturdiness, because of its endurance, the Cadillac has been called,

The Everlasting Car.

That this appellation is merited, we need but point to the 75,000 Cadillacs produced, all of which to the best of our knowledge are still doing duty, the oldest after eleven years of service—and many of them after having passed the 100,000 mile mark.

How much should an automobile weigh?

It should weigh enough to enable it successfully to perform the duties required of it.

It should weigh enough to enable it successfully to perform those duties day-in-and-day-out and year-in-and-year-out, at a minimum outlay for operation and maintenance,—performance and satisfaction considered,—and with a minimum depreciation in value after years of service.

CADILLAC MOTOR CAR CO., DETROIT, MICH.

How Much Spray Material Made.

Can you tell me how many pounds of lime and of sulphur it will take to spray 100 trees, 50 apples and 50 peach trees? Is salt any benefit to the trees? If so how much will it take to spray the 100 trees? W. W. P.

Parsonsburg, Md.

It will take about 50 gallons of lime-sulphur solution diluted one to nine to spray, for San José scale, 50 apple trees 10 or 12 years of age. Half that amount ought to cover 50 peach trees six or seven years old. Variation from this amount will depend upon the size of trees, the amount of pump pressure, kind of nozzle used, and very much upon how the man behind the gun handles the spray rod. To make 50 gallons of the above solution it will require: Fresh stone lime 20 pounds; flowers or flour of sulphur 15 pounds; water 50 gallons. Salt is not used nowadays for this mixture. For a small number of trees it is more convenient to buy the concentrated solution, unless one is equipped for making the home boiled. Five gallons of the concentrated solution will make 50 gallons of mixture ready to use and will cost about $2.25. W. R. B.

Composting Muck With Lime.

There is an article on page 527 under the head of "Commercial Humus." In part you say: "We do not hesitate to say that farmers who own these pond holes and swamps can haul this muck up to a dry place, mix it thoroughly with slaked lime, work it thoroughly once in the Winter, and at the end of six months have as high a quality of humus as is offered for sale by most of the leading companies." Would you let me know what proportion of lime to use? If I stacked it in the field, first a six-inch layer of muck, then one-half inch slaked lime, then six inches muck and more lime in alternate layers, to the depth of four or five feet, would that be lime enough? That would be one to 12. Should it be roofed over or covered with swamp hay? I presume that common lump lime, air-slaked, is what you mean. Would this do to raise field beans on gravel soil? L. F. P.

Maine.

The general rule is to use about 200 pounds of air-slaked lime to each ton of the muck. That means about one part in 10. Some farmers use less than this, but for quick and active results this amount of lime will be found useful. The lime referred to is air-slaked lime, which should be lump lime left exposed until it crumbles to a powder. It would be advisable to cover the pile of muck over, although this is not necessary. You must remember that the muck is valuable chiefly for the amount of nitrogen which it contains. As a rule it is very deficient in both phosphoric acid and potash. The bean crop is peculiarly in need of both phosphate and potash, and for a complete fertilizer, this should be added to the muck. A good plan is to use a quantity of the fermented muck and harrow it in after plowing. Then drill in a combination of three parts acid phosphate to one part muriate of potash, using 400 or 500 pounds of this mixture per acre. In this way the muck can be used to supply the nitrogen, while the chemicals complete the balanced fertilizer. If you have quantities of hen manure or horse manure, which can be thrown into the pile from time to time as it is built up, you will quicken the ferments and hasten the preparation of the muck.

THE OHIO CLOVER FAMILY.

Many farmers in growing clover confine themselves to one or two varieties, while there is a whole family of these legumes that will grow on their farms, each with a special place where it will fit in better than any other. The two Red clovers, Medium and Mammoth, are biennials under ordinary conditions. In Central Ohio the Medium Red is ready to harvest about the 20th of June and the Mammoth Red about the middle of July. The latter should always have a strong seeding of Timothy to make it fine and hold it up, otherwise it grows too coarse and is likely to fall down. When thus seeded it makes a very large crop of good mixed hay. Alsike, a perennial clover, is valuable as a hay crop and should be sown with Medium Red, one part Alsike to two parts red. This combination will make more hay per acre than either will alone. Alsike is also the most valuable of all clovers for pasture on account of its perennial habit. The little White clover, also a perennial, is valuable in pastures, as it is permanent and adds to the amount of feed that the permanent pasture will produce. It is also very useful as a lawn grass, and should be sown in every lawn where a water supply is not at hand for use in dry weather. If not allowed to form blossoms and ripen seed it will remain green and fine in very dry weather. The only annual clover is the Crimson, the handsomest of all the family. Its value for hay or pasture is not equal to the other clovers. But where it grows well it is one of the very best cover crops. Sown in a late cultivation of the corn it grows later in the Fall and earlier in the Spring than any of the clovers. On good rich corn land a crop can be grown after corn and be in full bloom to plow for corn again the next Spring, thus helping to keep up the humus supply where corn is grown two years in succession. However, it is not a sure crop in Ohio, except on good rich dry soil.

Sweet clover, formerly known as a weed and still so regarded in some places, is coming into prominence. Where it has been tried there are two kinds, the white and yellow blossoms, the white being the better variety. The great value of the Sweet clover is in its soil improving powers. It will grow on very thin worn land if lime is present in sufficient quantities. On eroded hill land it is very valuable as making the soil conditions possible for Blue grass to follow it. It pays to have some of it in permanent pasture or fields to be pastured for a few years. Experiments prove that it has a value for hay when properly cared for. However its greatest use so far is as a soil restorer. It is also a biennial plant.

Alfalfa, a perennial plant, is the greatest of all the clovers where it can be grown successfully. It is one of the most widely distributed of all forage plants, and we are coming to believe that it can be grown on most farms if the conditions it demands are complied with. Its value is so great that it is well worth while going to both time and expense to establish at least a few acres on every farm where it can be grown. With this splendid array of clover to choose from there are very few farmers who might not, instead of one variety, be successfully and profitably growing at least four or five kinds of clover. When nature has been so lavish of her gifts to us of these legumes let us make the fullest possible use of them.

Ohio. HORATIO MARKLEY.

THE TENANT'S SHARE.—I notice on page 298 some questions asked by C. S. in regard to working a farm on shares, answered by W. M. K. If it is worked for one-third, and owner finds stock and tools, why should the tenant expect the owner to pay for thrashing the grain, any more than for husking the corn, or digging the potatoes, or any other part of the regular work? As to baling hay, if tenant is allowed to sell hay, which very few dairy farmers permit, it seems to me it is "up to the tenant" how he shall market it. Let us hear from others.

E. M. F.

"PA, did you eat any of the cook's dough?" "Of course not, child. What makes you ask that?" "Because I heard ma say she was going to make you cough it up."—Baltimore American.

"DEYO" Means Farm Profit

You Can't Beat the Land Tax—the Decay Tax, Yes!

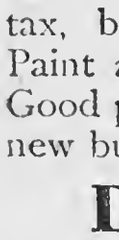
The decay tax is high. A worn out paint coat results in rot, repair bills, run-down, hard-to-sell houses and a bad neighborhood spirit. That's a heavy tax, but you can dodge it. Paint *in time* and paint right. Good paint is far cheaper than new buildings.

Dutch Boy White Lead

and Dutch Boy linseed oil form paint so fine that it enters every joint or pore that would otherwise let the weather in; so weather-proof that it defies rain, fog and snow; so elastic that it stretches or contracts with the wood. It lasts and beautifies for years. Your painter can mix it, any tint—or you can.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

A Text Book on House Painting FREE!



Ask for Farmers' Paint Helps No. 258 It contains full instructions for mixing all paint colors for any surface or weather condition; how to choose the "look-well-together and the wear-well colors"; how to estimate probable paint required, as well as paint costs; how to test paint for purity.

THE MAIL BAG.

Rock Phosphate on Strawberries.

I am going to set out two acres of strawberries this Spring, and would like to know if it would be advisable to use some rock phosphate. If so how much would you advise using to the acre, and what is the best way to apply it? I have a good rich loam soil. E. R.
Herrin, Ill.

No, we do not believe the rock phosphate would have any effect upon the strawberries. We should as soon expect a trotting horse to make a good record on a diet of rye straw. The strawberry demands *available* plant food if you are to expect this crop to do well. If your soil needs phosphoric acid and strawberries are wanted use acid phosphate. The rock phosphate may have value in permanently enriching the soil but for garden and fruit crops you need *active* plant food.

Cover Crop tor Light Soil.

What is the best cover crop to improve light soil—to be sown now and turned under in August? B. R.

For a light soil, the object being to put all the humus possible into it, we should sow the ground this Spring with Canada peas and oats as often described. Plow this crop under in late June, and give a fair dressing of lime. Then work up the soil at once and sow buckwheat and Cow-horn turnips. Plow this crop under in August, and you will be ready for seeding the Winter grain or grass.

Marketing Celery and Lettuce.

Could you give me any information in regard to marketing celery and lettuce?
New York. E. E. H.

Lettuce is marketed in baskets, barrels and crates. Perhaps the most popular package is the basket shaped like an inverted bell, holding about one bushel. Celery shipped here mainly in the rough, set up endwise in crates about three feet square, and later washed and bunched in warehouses here. When washed and trimmed on the farm it is packed in a variety of shallow boxes, sometimes tied in bunches of three stalks and sometimes singly.

Charging Effervescent Beverages.

When sweet cider, or for that matter any other non-alcoholic drink, is being bottled, what substance is added, and how, to make it sparkle or effervesce? What makes the so-called soda water or "soda pop" effervesce and how is the soda water made? G. B.
Meadow, Va.

The substance added in each case is carbonic acid gas forced in under high pressure, usually more than one hundred pounds per square inch. Soda water is merely common water to which this same carbonic acid gas has been added, so carbonated ginger ale, carbonated drinks of all kinds, are the drinks to which this gas has been added.

Leather Waste as Fertilizer.

Would the leather dust waste from a shoe factory have value as a fertilizer to use on lawn or garden? F. H. C.
Penn Yan, N. Y.

Very little if any. Leather contains considerable nitrogen, but is so unavailable that it will lie in the soil for years practically unchanged. It is doubtful if you would see any benefit from it for three years or more. It would not pay to spend money for this leather.

Fertilizer for Silage Corn.

I have three acres of land from which I cut rye last season, which I intend to plant to silo corn. Having lost my seeding and with no manure to turn under what kind of fertilizer would you advise using, and how much necessary to produce a good crop? How should the corn be planted to produce the most feed regardless of grain? C. J. R.

On such a field we should use one of the commercial corn mixtures, or two parts by weight of tankage, three parts acid phosphate and one part muriate of potash. Use at least 600 pounds per acre. From choice we should drill this corn so the stalks will stand about nine inches apart in three-foot drills.

Sawdust for Orchard Mulch

We have set out an orchard which we intend to manage after mulch method. We are cutting a timber lot, and there is quite a demand for the sawdust at 50 cents per load. We think we might better hold it for mulching the trees. Do you see anything against using it as a mulch? F. M. C.
New Jersey.

Our experience with raw sawdust has not been satisfactory for mulching trees. It is too sour, does not decay rapidly, and thus does not furnish a food form of humus. After the sawdust has been rotted thoroughly it will prove satisfactory. If the sawdust can be used as bedding, and thoroughly soaked with the liquids, or kept for a few months with the horse manure, it will then make a fair mulch for the trees, although we should use lime in connection with it. Raw sawdust, however, is not good to put around trees, and in our own case we should let the sawdust go at 50 cents a load.

Canada Peas and Oats on Poor Land.

Are Canada peas and oats the best crop to grow on poor moist land for hay? This hay is for dairy cows. Will lime help this crop? L. F. C.

It is a mistake to suppose that oats and peas will give a good crop on poor land. This crop requires good soil, either naturally strong, or made so through the addition of fertilizers or manures. The lime will help on such land, but you can hardly expect a profitable crop unless you feed it well.

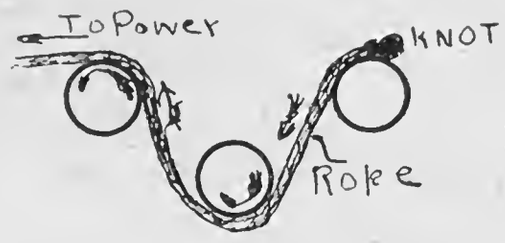
Preparing Sod for Potatoes.

I am thinking of planting seven acres of sod ground to potatoes, which I am going to cover with manure, and apply 300 pounds of phosphate analyzing 10 per cent. phosphoric acid and eight per cent. potash, applying the latter after the ground is plowed. Would an additional amount of rock phosphate increase the yield? If so how much should be applied? C. J. R.

No. You will not be likely to benefit in this year's potato crop by using raw rock phosphate. The potato is a quick-growing crop and needs available plant food. The rock phosphate, used with manure, might help clover or grass next year, or in following years, but for a crop like potatoes use available plant food.

Taking Kinks Out of Rope.

Some time ago I saw a question asking how to avoid kinks in a hay-carrier rope. I experienced this annoyance myself, and the following is the only successful remedy I could find: I procured a swivel the proper size for the rope, and spliced it in the end of the rope with a long splice, so it would run through the carrier block. Then instead of tying a knot in the end of the rope, I removed the pulley wheel and replaced the axle,



THE-OLD-METHOD

MY-METHOD.

putting it through the eye in the swivel. Now, when I pull down the fork, I can take all the twist out of the rope with ease. The sketch explains it.
Massachusetts. D. A. H., JR.

Your Boy
can run the
Fuller & Johnson
FARM Pump Engine
without any trouble and without any danger to himself. It is so simple that it is easily understood and so well protected that there is no chance to get hurt. It will make him more interested and contented in his work on the farm, and at the same time give him some valuable education. It will also relieve you of all worry about water for your stock.

The Fuller & Johnson Farm Pump Engine will pump from 270 to 2450 gallons of water per hour. Needs no belts, braces or special platform. No extras to buy—comes ready to set up to your pump and start going. It will also operate other machines. *Write for Catalog No. 17 and read all about this remarkable engine and the remarkably low price at which it is sold.*

Fuller & Johnson Mfg. Company
51 Rowley Street Madison, Wisconsin

Four No-Rim-Cut Tires
For What Some Ask for Three

Here's a curious situation:

Not long ago the high-priced tire was the Goodyear No-Rim-Cut tire. It cost one-fifth more than other standard tires, because of four costly and exclusive features.

But with tremendous output our costs dropped. New factories, new equipment, helped. And we cut our profit until last year it averaged 6½ per cent. No-Rim-Cut prices came down last year 28 per cent.

Now 16 makes of tires cost more than Goodyear prices—some up to one-half more. You can buy four Goodyear tires now for what some makers ask for three.

Four Things Missing

Yet every high-priced tire lacks these four exclusive features:

Not one prevents rim-cutting in our satisfactory way. We control this feature, and no other faultless way has been found to end rim-cutting completely.

Not one gets the "On-Air" cure, which adds to our tire cost $1,500 daily. Each No-Rim-Cut tire is final-cured on air, to save the countless blow-outs due to wrinkled fabric.

Not one employs our patent method to combat tread separation.

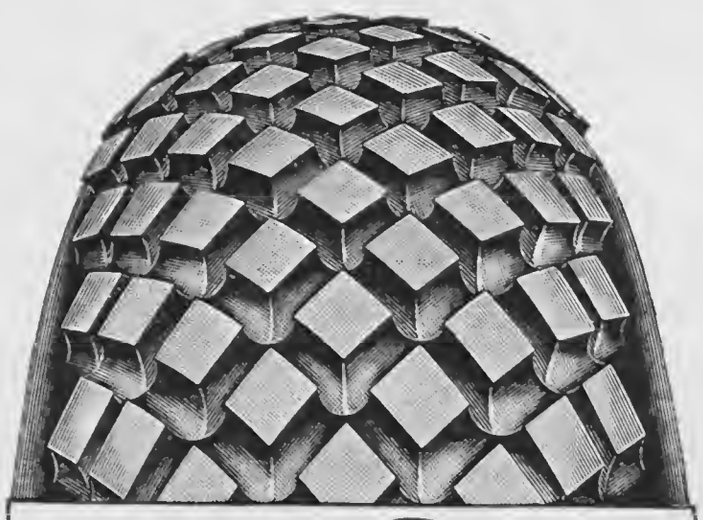
Not one has our double-thick All-Weather tread. A smooth tread on dry roads, but grasping wet roads with countless sharp-edged grips.

None of those costly tires, remember, has any of these features.

Up to 10,000 Tires a Day

Goodyear prices are due to the fact that we now build as high as 10,000 motor tires per day. No other one factory, we believe, turns out half so many.

And this output is due to the tire. Men have proved that No-Rim-Cut tires offer lowest cost per mile. They have proved it on hundreds of thousands of cars. Otherwise, some other tire would hold top place in Tiredom.



GOODYEAR
AKRON, OHIO
No-Rim-Cut Tires
With All-Weather Treads or Smooth

When someone asks an extra price make him show a reason.

Lower prices are easily explained. But don't pay more than No-Rim-Cut prices unless you know a reason. The verdict of users—as shown by sales—is that Goodyears are the world's best tires.

CROPS AND PRICES.

Auction sales of farm products are unknown here. The leading farm industry in this section is dairying and potato raising. The dairy products are as a rule sold to the creamery as sweet cream. Below are prices paid at two creameries about 20 miles apart, showing variation in price for the year 1913. This cream is collected at the company's expense and will test about 20 per cent. butterfat. There is so little interest taken in production of beef here I would not attempt to quote prices on beef cattle. Dairy cows to ship to market bring from $50 to $75, with an occasional sale of something fancy for $80 or $90. Apples are the only fruit grown for market here. The producer does the picking and furnishes the barrel, and delivers at the shipping point. The purchaser does the packing. The price paid for crop of 1913 was $2 per barrel for the poorer kinds, and $2.50 for standard varieties like Baldwin, Spy and King. The larger part of potato crop of 1913 has been sold for 50 cents per bushel at shipping point, the bushel being the unit of measure here. Buyers are now offering 60 cents per bushel.

Price of butterfat at creameries 20 miles apart: Skowhegan Jersey Creamery—Jan. 40, Feb. 38, Mar. 38, Apr. 38, May 36, June 34½, July 36, Aug. 36½, Sept. 37, Oct. 38½, Nov. 40, Dec. 39. Ferndale Creamery Harmony—Jan. 36, Feb. 36, Mar. 36, Apr. 35, May 31, June 30, July 33, Aug. 34, Sept. 36, Oct. 37, Nov. 38, Dec. 39. H. O. B.
Canaan, Me.

April 19.—The first half of April was cold and rainy; farmers getting behind with their work. No gardens plowed or potatoes planted yet; roads drying up. Wheat looking fine; grass will soon do to turn out on. Live stock looking well, very little selling at present. Corn 80; wheat 90; hay $11 to $12; potatoes $1 to $1.25; butter 20; eggs 16; chickens 12.
Chesterhill, O. W. B. H.

This is largely a fruit section. It is reported the peaches are killed, a large percentage at least, by the extreme cold of the past Winter, but hope it will not be as bad as reported. Apples are in good shape; they promise a large crop, but of course farmers are not buying barrels yet. The seasons are later almost every year; that is good for fruit, holding it back, but makes it hard to raise corn and other Summer crops; seems too short for most of them. Hay still holds at $14 per ton; potatoes 60; butter 22; eggs 18. Horses and cows are cheaper, but still bringing pretty good prices. Wheat has stood the Winter fairly well so far; now with a warm rain and sunshine wheat and grass will soon have the appearance of Spring that will be welcome to most farmers. W. D. S.
Newfane, N. Y.

The sugar season has not been as good as some years and some have taken in their buckets. A few have commenced to plow and fix fences. There is no local demand for hay, as silos are supplying the deficiency of fodder. The demand for milch cows is quiet. Eggs 18 to 20; jar butter 21. Meal $1.45; bran $1.55; middlings $1.60. P. S. S.
Mayville, N. Y.

Wheat is looking fine. Sowing clover seed, and pruning is going on. No hog cholera here that we know of. April is very windy, with no snow or rain as yet. Auction sales are over now; horses $50 to $200; cows $50 to $125; fat hogs $8 per hundred. No hay moving. Potatoes 45; corn at car 75; butter 25; eggs 17. L. T.
Eaton Co., Mich.

We have had a very severe Winter here; it continued through March, and even since April set in have had some ice. Peach, pear and cherry trees are now in full bloom, with prospects of two-third crops, caused by late freezing in March and April. Wheat and meadows are looking extra well, with unusual prospects for a big wheat crop. Good milch cows $50 to $100; stock cattle six to eight cents; hogs seven to nine cents; horses $100 to $175; good mares $200 to $250. Wheat $1; corn $1.05; oats 70; potatoes $1. Hens 13½; eggs 15; butter, nice, 20. The continued rains have put the farmers considerably behind with their Spring work. W. H.
Washburn, Tenn.

FIGHTING THE SCALE.—This section has something of a reputation for fruit, the local storages holding approximately one-quarter million barrels, and the San José scale is not dying out that we know of, except where persistent spraying is practiced. We do know of a good many trees, including some whole orchards that have died from the effects of the scale. Nature may be assisting in their removal by providing enemies that prey upon them, but she needs the assistance of man with a power pump and a good strong solution to remove them before they remove the trees. We know of one school district in which seven men have bought rigs this Spring that never owned one before as an absolute necessity to save their trees from these pests. Help nature and she will help you, but don't impose too much on her generosity.
Niagara Co., N. Y. S. A. P.

WILL YOUR MOWER LAST 40 YEARS?

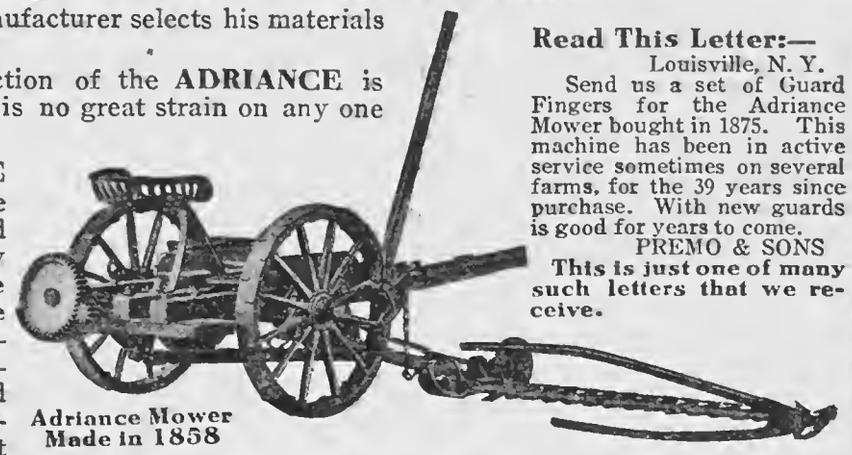
Don't you consider it good business to buy a Mower that will last 30 to 50 years instead of one that may last from 3 to 5 years?

Here are reasons why ADRIANCE MOWERS last longer and give better service than others:

No other manufacturer selects his materials with such care.

The construction of the **ADRIANCE** is such that there is no great strain on any one part.

ADRIANCE MOWERS are scientifically and mechanically correct. **The main frame** is one piece—very strong—absolutely rigid—insuring perfect alignment of shafts—perfect mesh of gears under most severe use.

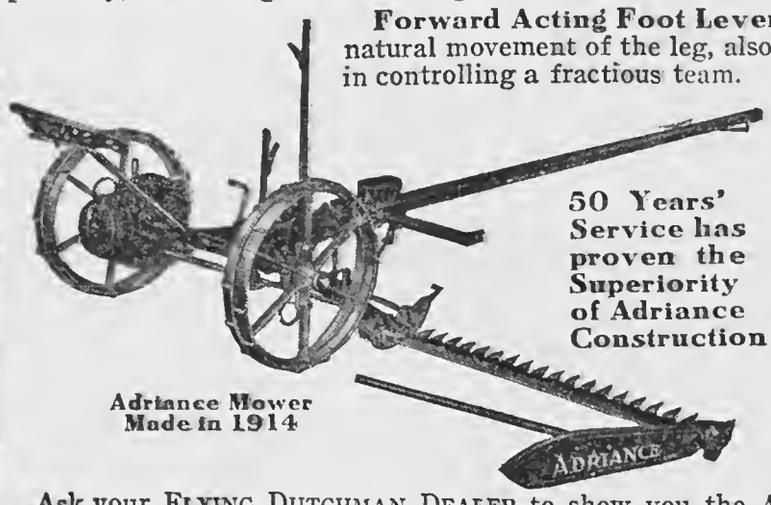


Adriance Mower Made in 1858

Read This Letter:—
Louisville, N. Y.
Send us a set of Guard Fingers for the Adriance Mower bought in 1875. This machine has been in active service sometimes on several farms, for the 39 years since purchase. With new guards is good for years to come.
PREMO & SONS
This is just one of many such letters that we receive.

Cutter Bar never binds—it is so flexible that it will follow uneven ground perfectly, also swings over the tongue when not in use.

Forward Acting Foot Lever does the work with a natural movement of the leg, also serves as a foot brace in controlling a fractious team.



Adriance Mower Made in 1914

50 Years' Service has proven the Superiority of Adriance Construction

ADRIANCE Spring Draft device completely overcomes shock to driver and team should an obstruction be met.

Beside being the strongest and best built mower on the market, you will find the **ADRIANCE** is the lightest draft and easiest to handle.

Ask your FLYING DUTCHMAN DEALER to show you the **ADRIANCE Mower.**

No Job Too Small

Get full profit. Keep your tractor busy. The Rumely OilPull runs economically at small loads as well as big ones. It is the closest regulated tractor built. It works steadily and smoothly at any load, and when it does a small job it presents you with a correspondingly small fuel bill.

RUMELY OILPULL TRACTOR LA PORTE IND.

15-30, 25-45, 30-60 horsepower

No other tractor compares with the OilPull in steadiness of running because no other can use the Secor-Higgins Oil-Fuel System. This system enables the OilPull to burn kerosene and even cheaper oil more efficiently than most tractors burn high-priced gasoline.

You will find work for the OilPull every week, the year round. It will plow, drill, disc, or harrow,—build roads and haul your crops; it will thresh, grind, shell or pump, and save money on every job.

Rumely service is back of every Rumely machine—49 branches and 11,000 dealers. Supplies and repairs on short notice.

Ask for our interesting OilPull catalog No. 353.

The Home Acre.

Destroying Bindweed.

Can you inform me how to clear my soil of a vine known here as the Virginia creeper, or morning-glory, a small creeping vine which mats very thickly over and in the soil? I have read that a seeding of Alfalfa would destroy the morning-glory; I suppose the common morning-glory is meant. The seed of the plant I have called the Virginia creeper very much resemble an onion seed. There seem to be different varieties of the same plant, some with pink blossoms and some with white. T. M.

Willard, N. Y.

The weed referred to is bindweed or morning-glory; Virginia creeper is a different vine, and we have never seen cases where it became a troublesome weed. There are two objectionable morning-glories common in the East, Convolvulus sepium or hedge bindweed, flowers wholly white, or white striped pink, and field bindweed, C. arvensis, much smaller, with pink flowers. They have fleshy creeping rootstocks which bear numerous buds, and every bit of the root is likely to grow when broken up by the plow. This makes the bindweeds extremely difficult to eradicate; they propagate far more freely in this way than from seed, which is often produced scantily. Short rotations will control bindweed, late-sown hoed crops or rape being useful. Frequent use of a broad-shared cultivator will exhaust the weed's vitality. Pasturing with hogs is also advised. Seeding to Alfalfa is recommended as it tends to smother the bindweed, while the frequent cutting keeps down the top growth. The Alfalfa should be followed by a hoed crop, which will finish the destruction of the bindweed.

Growth of Cherry Grafts.

I grafted a cherry tree January 24, and it grew. There was a little tree besides the one I grafted in January, and I put a graft on it in March; they both grew, but the January graft is five feet taller than the one I put in in March. Why is this? The first graft could not start till the sap started in the Spring, neither could the graft that was put in in March. G. B. H.

Mechanicsburg, Pa.

It may be that the tree that made the strongest growth from the grafts set was the most vigorous. It is never wise to graft a feeble tree or branch with the expectation of getting good results. But it may have been from some other cause, such as a better union between the stock and scion. No one can always tell "the whys and wherefores" of things that occur, but it is well to try to understand the reasons so as to have them for future guidance. Cherry trees should always be grafted early, but January seems very early for Pennsylvania climate. Severe cold is almost sure to injure grafts that are set, and it must have been cold the date in January.

H. E. VAN DEMAN.

Strawberries for New York.

What varieties of strawberries are most suitable for Onondaga County, N. Y.? We wish to set one acre to about four or five varieties for market purposes. F. S.

Liverpool, N. Y.

Ten years ago I would probably have been very ready to advise F. S. what varieties to set, and possibly would have strongly recommended certain varieties on the strength of their behavior for a few years under my conditions. The safest way is for each grower to test out varieties for himself, as many varieties are very variable under different conditions, even behaving very differently occasionally on adjoining farms and in different fields on the same farm. There are, however, a few varieties that seem to do well under a wide range of conditions, and it is safe for the beginner to stick to these until he has had time to test out others in a small way.

Michel's Early has proven one of the best extra earlies with me, but like all extra earlies will not give as heavy a yield as the later varieties. Senator Dunlap seems at home under many different conditions and closely follows Michel's Early in season. If not allowed to grow too thickly it will give a good crop of handsome berries. Sample, Wm. Belt and Stevens Late do well over a wide range and produce a heavy crop of first class berries under good culture. All are strong growers and should be restricted. With the exception of Sample all have perfect blossoms. Sample has a pistillate blossom and must be set near staminate blossoming varieties to secure pollination. Sample is my very best berry. Let F. S. set aside one row for testing varieties and set a dozen or 25 of each variety. Then keep close tabs on this row at fruiting time and don't go wild over a variety from one season's trial. The probability is another variety will beat it next year. Among others to try in this row be sure to include Brandywine, Bubach, Chesapeake, Columbia, Glen Mary, Prolific and Uncle Jim. If any strawberries are grown near him F. S. can do no better than to get the experience of his neighbors with varieties. G. R. S.

Small Greenhouse for Spring Use.

I have just built greenhouse 11x30 feet, ridge about six feet, front side two feet high, 10.3x6 sash on south side, north roof papered, north side four feet high. I wish to start melons mostly, and perhaps transfer a few tomatoes, etc., from hotbed. Morning sun strikes two feet of north wall (it is dug into south side of hill). Do you think it suitable? Can I put bench along north wall? N. E. B.

Southold, L. I.

If I understand it you wish to use your greenhouse for, or in place of, a cold frame. That will work all right, and it is done quite often, but I do not think it would be advisable to put a bench along the north wall unless the sun will strike the melon or tomato plants you put there for a good part of the day. After we fill our cold frames with tomatoes we then clean all plants out of the hothouse (small greenhouse) and spot tomatoes in it just as we do in the cold frames. We have no fire in it at this time. It should be remembered, however, that there is much more space to heat up in a greenhouse than in a cold frame, and in cold weather such as we are having this Spring one can handle plants to better advantage in cold frames. TRUCKER, JR.

Germs of Potato Scab.

I notice the ability of scab germs to winter in the soil is in question, and will give a bit of experience. When you distributed the Carman No. 1, I came honestly in possession of eight scabby little tubers. They were cut fine and treated best we knew how. Most of them were planted in the kitchen garden, but a few hills displaced so much of the mangel crop, the resulting crop was of course very scabby; the next year it was soaked in corrosive sublimate and planted on the patch occupied by the mangels the previous year. That portion where potatoes grew both years was scabby, but the remainder of the crop was smooth. E. L. S.

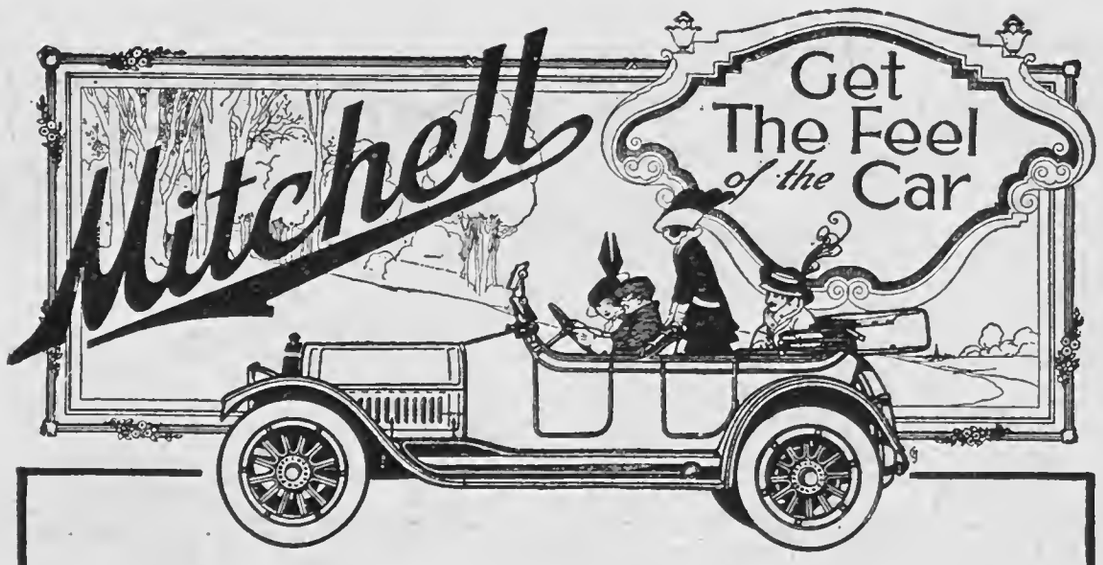
North Truro, Mass.

This experience supports scientific results. The scab disease is caused by a germ which can live over in the soil for several years. We might use perfectly smooth seed, or even soak thoroughly in the formalin solution, and yet have a scabby crop if these germs are already in the soil. The use of lime on such soil would stimulate the growth of those scab germs—while plowing under a green crop would have the opposite effect. It is not safe to follow potatoes with potatoes whenever the crop shows scab. We know of a farm where a five-year rotation is followed. Yet one field always grows a scabby crop even with four years in between.

Onion Smut.

The Wisconsin Experiment Station announces that experiments with a solution of formalin in water have shown the value of this remedy.

"The solution which brought most success was made at the rate of two ounces of formalin per gallon of water and applied at the rate of 145 gallons an acre, or about a gallon to every 300 feet of row. By means of an ordinary two-gallon oil can fastened by iron clamps on to the seeder and a soft lead pipe capable of being twisted in the proper direction, the solution can be quite easily applied. Smut is the most prevalent fungus disease attacking the onion. It is caused by a parasite living within the soil. As the land which is especially adapted to onion growing is somewhat limited, the same fields are too frequently planted to this crop year after year, with the result that the soil becomes charged with disease organisms."



Get the Personal Touch!

Sixes or fours—the Mitchell-Lewis Motor Company makes both. *Our idea is to suit the public taste.* We are not trying to cram either down your throat. We want you to try them both, sit in the driver's seat, get "the feel of the car," note carefully the action of the engine, the brakes and the steering apparatus. You can get the pulse of any car by doing the driving yourself. *And you can't get it any other way.*

You ought to know your own car even if you hire a driver. You ought to know it *before you buy it.* That definite process of acquiring information will often save you a lot of money and worlds of trouble. It eliminates all element of risk. *You buy with your eyes open*, and you don't buy through the eyes of somebody else who might happen to be prejudiced. We believe that anything which costs as much as an automobile ought to be bought that way—*and no other way.*

We are asking prospective customers to buy Mitchells that way. We are asking them to drive the car themselves and get what is known as "the feel of the car." It can't be gotten by sitting in the tonneau or even alongside the driver. The only way to reach the pulse of a car is *through the steering wheel.* The matter of detail may be learned afterwards if the car behaves well enough to arouse your interest. We think the Mitchell car whether Six or Four is the buy of the year. Try it yourself and see how close we have come to the truth.

Here is the Equipment for all the Mitchell Models Which Is Included in the List Prices:

Electric self-starter and generator—electric lights—electric horn—electric magnetic exploring lamp—mohair top and dust cover—Tungsten valves—Jiffy quick-action side curtains—quick-action two-piece rain vision wind-shield—demountable rims with one extra—speedometer—double extra tire carriers—Bair bow holders—license plate bracket—pump, jack and complete set of first-class tools.

MARTIN'S METAL STACK COVERS

Galvanized—Corrugated—Extra Quality Coating—

SAVE ALL THE HAY—PAY BIG PROFITS!

More economical than barns or permanent sheds. Easy to put on and take off. Made in sections, thus occupying little space when not in use. Made in all sizes.

Mr. Hammitt of Hardy, Neb., says: "Your cover preserved my hay fine. I got $1.00 per ton more for stack protected with your cover than for other stacks in same field."

The saving on the first stack of hay will more than pay for Martin's Metal Stack Cover. With ordinary care will last 15 to 20 years.

SPECIAL OFFER! Write today for free, illustrated literature and special introductory price to first purchaser in each locality. Write QUICK!

THE MARTIN METAL STACK COVER CO., Dept. 102

900-912 East Second St., Wichita, Kans. 25 S. Desplaines St., Chicago, Ill.

Stocks carried in Wichita, Kansas, Chicago, Illinois and Canton, Ohio. 10

Do Better Disking and Raise Bigger Crops

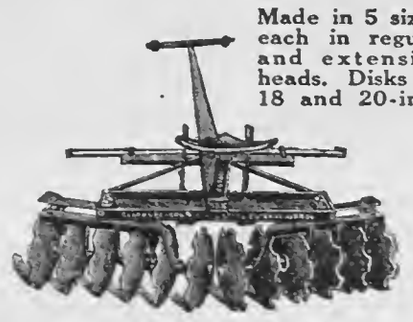
—You'll Make More Money

Regardless of how fertile or how poor the land, you can make more money by doing better disking. You can grow bigger crops at proportionately less cost.

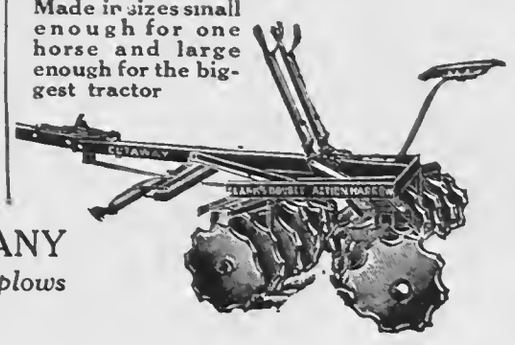
Cutaway (CLARK)

disk harrows will make you more money—they are specially designed for intensive tillage. Many farmers not only grow *bigger* crops at *proportionately* less cost by using CUTAWAY (CLARK) disk harrows, but they raise more per acre at less cost per acre. There is one for the biggest tractor or the smallest horse. Ask your dealer to show you a CUTAWAY (CLARK) disk harrow. If he doesn't sell the CUTAWAY (CLARK), write us. Don't accept a substitute. We ship direct where we have no agent. Write today for free catalog, *"The Soil and Intensive Tillage."*

Made in 5 sizes, each in regular and extension heads. Disks 16, 18 and 20-inch



Made in sizes small enough for one horse and large enough for the biggest tractor



THE CUTAWAY HARROW COMPANY

Maker of the original CLARK disk harrows and plows

839 MAIN ST., HIGGANUM, CONN.

EVENTS OF THE WEEK.

DOMESTIC.—April 17 a demented man attempted to assassinate Mayor Mitchel of New York by shooting at him while the mayor was in his automobile in front of the city hall. The bullet struck Corporation Counsel Polk in the jaw, inflicting a painful and disfiguring wound. The assailant, Michael P. Mahoney, aged 72, appears to be a dangerous crank. He was a blacksmith, out of work.

Seven men and one woman perished in the wreck of the three masted schooner Charles K. Buckley in the breakers off Long Branch, N. J., on April 15. There was only one survivor.

The government's hearing in a suit to be brought to dissolve the American Tin Plate Company began April 17, in the Federal Court, Brooklyn. The charges in the complaint include the bill of sale of subsidiary companies to the defendant, in which they agreed not to manufacture tin cans or sheet iron packages within a radius of 15 miles of the home office of the American Tin Plate Company in New York, for any company excepting the trust.

The Hotel Maryland, at Pasadena, one of the finest hotels in California, was swept by flames April 19. The amount of the damage may exceed $500,000. The structure was built about a decade ago. The blaze, it is believed, started from a defective gas furnace.

Fire in a small hotel at 741 Eighth Avenue, New York, April 17, caused the death of 11 persons. The building had narrow halls and one stairway, and the fire started in rubbish stored at the foot of the stairs. The Fire Department asserts the fire was due to gross carelessness; there were no adequate fire escapes.

The steamer Kyle, which went out two weeks before to search for the missing sealer Southern Cross, returned to St. Johns, N. F., April 20, with no news of the vessel. The Southern Cross, which had a crew of 173 men, has been given up as lost.

Thirty-nine dead, more than two-thirds of them women and children, a score missing and more than 20 wounded is the toll known, April 21, to have been taken in the 14 hour battle which raged the day before between State troops and striking coal miners in the Ludlow district, Colorado. Many fatalities were due to the action of the militia in driving the strikers out of their tent colony, and firing it. Further bloodshed was expected. The militia was armed with machine guns. Italians, Greeks and Austrian miners have appealed to their consular representatives for protection, and John McLennan, president of the local union district, asked the Red Cross in Denver to be prepared to render aid. The trouble is on the property of the Colorado Fuel and Iron Company, Rockefeller holdings. No train service through the war zone is permitted. A command of the troops is hemmed in by the strikers' lines, which extend three miles. Through this cordon only the dead wagon is allowed to pass. The Ludlow camp is a mass of charred debris. In the holes dug for protection again the rifle fire are the bodies of women and children, killed when the flames swept over them.

FARM AND GARDEN.—The Indiana Apple Show will be held at Tomlinson Hall, Indianapolis, November 18-24.

A "Potato Special" has been operated in the potato-growing section of Wisconsin by the Chicago & Northwestern railroad. The road is coöperating with the Agricultural College of the University of Wisconsin. The train was operated through Wood, Waushara, Columbia, Marquette, Adams and Juneau counties, each of which is among the leading potato-growing counties of the State. Practical lectures and demonstrations were given by experts from the university. The subject of pure seed growing was given especial attention.

The dreaded browntail moth has made its appearance again in New York State, and the State Department of Agriculture has taken steps for the immediate extermination of the pest. The department has ordered a minute inspection of every tree in the vicinity of East Hampton, Sag Harbor and other towns in Eastern Long Island. It has extended a general call to all land owners to aid and cooperate in finding and destroying the webs.

The United States Department of Agriculture, in an endeavor to obtain as much information as possible on the behavior of ornamental plants in all parts of the United States, asks the coöperation of interested persons throughout the country that the details may be obtained. With this end in view a form for recording such facts has been prepared. Blanks will be supplied to those willing to report information of this character by writing to F. L. Mulford, Landscape Gardener, Department of Agriculture, Washington, D. C.

The committee on the preliminary organization of the proposed Farm Mortgage Bankers' Association of America will hold a meeting at the Hotel Astor on May 7. Farm mortgage bankers from all parts of the United States have been asked to assist in forming the association. A form of constitution and by-laws has been drawn up, to be approved at the coming meeting.

Charles E. Henry, for twenty-five years a member of the Live Stock Exchange, who declares that he was driven out of business by the live stock "trust," began action at Bellevue, Ill., April 17, in a $250,000 damage suit against the exchange and all the packers who do a nationwide business. Henry alleges that an outsider has no chance to operate against the "trust," which fixes the prices and commissions to suit the members and refuses to buy or sell stock to or for any one who is not a member of this or any allied exchange anywhere in the country.

The semi-annual meeting of the Georgia State Horticultural Society will be held at Griffin, Ga., August 5-6.

The thirty-ninth annual convention of the American Association of Nurserymen will be held at Cleveland, O., June 21-26; secretary John Hall, 201 Granite Building, Rochester, N. Y.

MEXICO.—Active hostilities began between the United States and Mexico April 21. Marine forces from the Utah, the Florida and the Prairie seized Vera Cruz. Fourteen Americans, bluejackets and marines, were killed by the fire of the Mexican soldiers and 50 wounded. The Mexican death list is put at 126, their wounded 195. The waterfront, the custom house and all important piers, including those under the terminal works from which extend the railroads to the capital, were occupied. The Mexican commander, General Gustavo Maas, offered a stubborn resistance to the American advance, and for many hours there was fighting in the streets. The hurried action, without formal declaration of war, was to prevent the landing at Vera Cruz of a large shipment of arms and ammunition from Germany. April 23 Huerta formally severed diplomatic relations with this country and Nelson O'Shaughnessy, Chargé d'Affaires at Mexico City, received his passports and prepared to leave. An order was issued for the re-establishment of the embargo on transportation of arms across the Mexican border. This was a sequel of the threatening attitude of the Constitutionalist chief, Gen. Carranza. April 23 Gov. Johnson of California ordered nine companies of militia from San Diego to the Mexican border, where uneasiness existed among the people.

COMING FARMERS' MEETINGS.

American Association of Nurserymen, Cleveland, O., June 24-26.

Georgia State Horticultural Society, Summer meeting, Grillin, Ga., August 5-6.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

"FATHER," said the small boy, "what is a jingo?" "A jingo, my son, is a man who devotes his time to thinking up opportunities for other people to go out and be shot at."—Washington Star.

NEWRICH: "Captain, I understand there are several water-tight compartments on this boat. Well, I want one of those, and I don't care what it costs."—Credit Lost.

GLADYS (playing the piano): "Dear me, I am always wishing to break into song!" Muriel: "You wouldn't have to break in, dear, if you could find the key."—Melbourne Leader.

MUDGE: "Here's a man figured out that if all the money in the world were divided equally, each adult would get about thirty dollars." Mceg: "He's wrong. My wife would get sixty dollars."—Boston Transcript.

"WERE you glad to get back to school and see your dear teacher?" "Well," replied the very observant boy, "I guess I was just about as glad as dear teacher was to get back and see me."—Chicago Record.

America's Telephones Lead the World Service Best—Cost Lowest

from London "Daily Mail"

Why is it that Government ownership and management of the telephones is practically always a failure?

Why is it that throughout the length and breadth of Great Britain and the Continent hardly a single efficient long-distance service is to be found? Why is it that in New York one [illegible]

from "Electrical Industries" (London)

THERE is a certain amount of satisfaction in the fact that Mr. Winston Churchill got so angry over the freaks of the telephone the other day that he flung his receiver on the floor. As a member of the Government which purchased the telephone system, he deserves all the torture that Post Office working can inflict. But his rage, [illegible]

From "Le Petit Phare de Nantes," Paris

"But today I found I had to talk with Saint-Malo, and, wishing to be put through quickly, I had my name inscribed on the waiting list first thing in the morning; the operator told me—though very amiably, I must confess—that I would have to wait thirteen hours and ten minutes (you are reading it right) in order to be put through."

Herr Haberland, Deputy, in the Reichstag

"The average time required to get a connection with Berlin is now 1½ hours. Our business life and trade suffer considerably on account of this lack of telephone facilities, which exists not only between Dusseldorf and Berlin and between Berlin and the West, but also between other towns, such as Strassburg, Antwerp, etc."

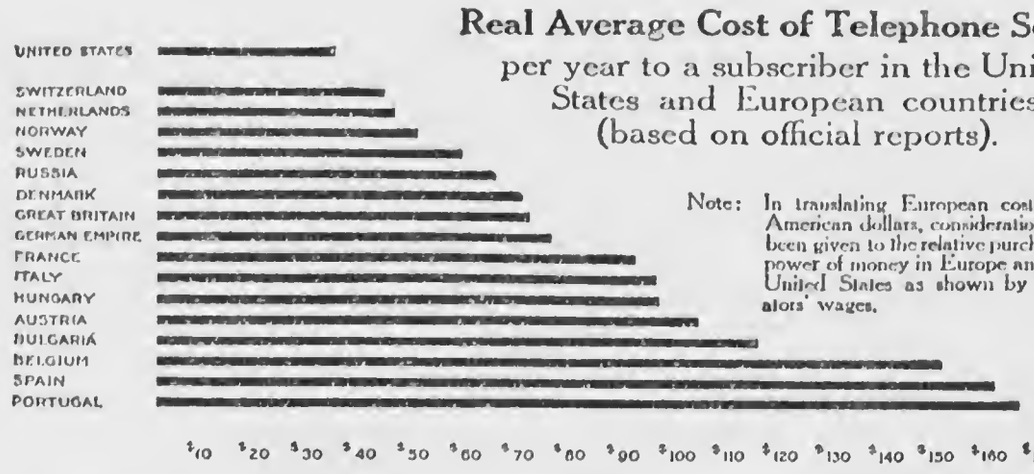
Herr Wendel, in the German Diet.

"I refer here to Freiberg. There the entire telephone service is interrupted at 9 o'clock p. m. Five minutes after 9 o'clock it is impossible to obtain a telephone connection."

Dr. R. Luther, in the Dresdner Anzeiger

"In the year 1913, 36 years after the discovery of the electro-magnetic telephone, in the age of the beginning of wireless telegraphy, one of the largest cities of Germany, Dresden, with half a million inhabitants, is without adequate telephone facilities."

Real Average Cost of Telephone Service
per year to a subscriber in the United States and European countries (based on official reports).



Note: In translating European costs into American dollars, consideration has been given to the relative purchasing power of money in Europe and the United States as shown by operators' wages.

These are the reasons why there are twelve times as many telephones for each hundred persons in the United States as in Europe.

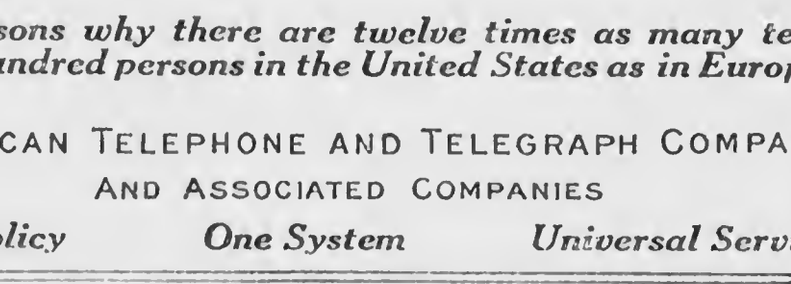
Ellis Champion Threshers

Be Your Own Thresherman

Save enough to own the Thresher. Be independent. Do the work when you get ready.



Suit everyone. Both the professional thresherman or the farmer who wants a home outfit will find the Champion rightly named. The picture shows ELLIS CHAMPION NO. 2. It is complete with stacker, tailings, elevator and grain bagger. Connect it with steam, gasoline, tread or any other power, put in the grain and the Champion does the rest. No straw clogging. Any size.

We also make tread and sweep horse-power, drag or circular saws ensilage cutters, corn shellers, etc. Our catalog tells the whole story.

ELLIS KEYSTONE AGRICULTURAL WORKS, Pottstown, Pa.

"Two or Three Times as Good a Crop"
by the use of
Ferguson's
NITROGEN BACTERIA

That is what one user (name on request) writes of his experience last season with Field Peas. Scores of other users have had similar experiences with legumes—Clover, Alfalfa, Vetch, Peas, Beans.

There are three good reasons
for inoculating your seeds with Ferguson's Bacteria—

1. Bigger, better crops.
2. Richer soil for coming seasons.
3. No expense for fertilizers.

Ferguson's Bacteria gathers Nitrogen—the food plants must have—from the air. They store it on the roots, using part for the present crop, having part for the future.

$2 worth of Ferguson's Bacteria will do the work of $40 worth of commercial fertilizer.

Quarter-acre quantity, 50c; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.

AMERICAN SHEET AND TIN PLATE COMPANY, Frick Bldg., Pittsburgh.

Oats and Peas for Horse Hay.

Are oats and Canadian peas good for horse hay, or what would be best to put in with oats? Soil is heavy loam in a run-down apple orchard. O. H.

Irondequoit, N. Y.

Oats and peas properly cured will make a good feed for horses. We have fed it for exclusive roughage for many months, and the horses did well upon it. The oats help out the peas in feeding value, and also keep them off the ground, so that they cut and cure to better advantage. This crop requires good soil, or a fair amount of manure and fertilizer in order to give a good yield.

Adding Nitrate to Fertilizer.

I have on hand one ton of fertilizer containing 1-8-4, and I wish to know how much nitrate of soda to add to make it 2½-8-4. I also have one ton of 2-8-7 that I wish to increase to 3½-8-7. G. H. V. D.

New York.

Your ton of fertilizer contains one per cent. or 20 pounds of nitrogen. You want 2½ per cent. or 50 pounds. Thus you must add 30 pounds of nitrogen. Nitrate of soda contains 16 per cent. of nitrogen or 16 pounds to each 100 pounds. Thus if you use 200 pounds of nitrate you add 32 pounds, which will give what you want. This will make 2,200 pounds instead of one ton. To be exactly accurate you should add a few pounds each of acid phosphate and potash. Eight per cent. of 2,000 is 160 pounds of phosphoric acid, while eight per cent. of 2,200 is 160. You can add 100 pounds of acid phosphate and 25 pounds muriate of potash if you wish to be exact, but we should use the 200 pounds of nitrate and go ahead.

The Cost of Lawing.

The article on page 435, "Over-rated Professions," by A. O. Hill, will bear reading and considering. Mr. Hill brings to mind a matter that demands serious attention. I am an old man, and can well remember the time when lawyers did not generally charge extravagant prices for their services, and all kinds of court officials had very moderate pay compared with what they now have. No one objects to a proportionate rise in prices all round, but we do not want to increase the cost of the courts tenfold.

Statistics which I have examined and can furnish show that the cost of the courts of Vermont have increased more than tenfold within what may be called a recent period. It is well understood by many people who belong to the commoner class that $100 or more will not go far in obtaining justice in the courts against a couple of unscrupulous lawyers opposed. All are educated to advocate either side, whichever employs them. I am glad to know, however, that there have been cases which a lawyer has been found with honor enough to decline.

The constitution of Vermont, Part 1, Sec. 4, reads (italics added): "Every person within this State ought to find a certain remedy, by having recourse to the laws, for all injuries or wrongs he may receive in his person or property, or character; he ought to obtain right and justice, *freely and without being obliged to purchase it*, completely and without any denial; promptly and without delay; conformably to the laws." M. O. H.

Freezing Water Supply.

Regarding the article on page 447, W. C. H. "Freezing Water Supply," I have a water supply on my farm almost like the one mentioned, but with the thermometer 35 below, as it was here this last Winter, and the ground frozen solid all around the pipe, it has never given any trouble. If I had a system in the way he has I would expect the same results as he got. My pipe is about 1,500 feet long with not more than a 10-foot fall. The first half is inch pipe, remainder ¾-inch. I have no branch pipes. The water comes first to the cow barn, and makes a circuit of the barn, next to the hoghouse, makes a circuit of this, then on to the house, the same here, winding up in the horse barn. In the end of the pipe I put a plug and let a small continuous stream run; this will allow all faucets on the pipe to flow water when open. In each building that the water goes through I put a faucet on the turn of the pipe. These faucets will freeze up in extreme weather, but a pint of water will thaw them and you will find the running water there every time. I am unable to see why W. C. H. puts one-inch pipe in the center, I should think it should be at the intake.

Hamilton, N. Y. F. T.

Fresh-water Clams.

From your seemingly inexhaustible sources of information, can you inform me whether or not fresh-water clams are edible? C. W. G.

Syracuse, N. Y.

This question nearly ran the "inexhaustible sources" dry, but we have finally obtained the following from the highest authority:

"You are informed that the fresh-water clams are not generally regarded as edible. They presumably contain about the same quantity of nutriment as other shellfish, but are tough and insipid and, in some cases at least, have a disagreeable odor. They were eaten to some extent by the Indians and possibly, if properly prepared, might prove a fairly acceptable diet to white persons.

H. M. SMITH,
U. S. Fish Commissioner."

Want to Know.

ROOT CELLAR.—We are going to construct a root cellar this Spring outside of any building, and would like to know the best method of constructing such a cellar. A. C. C.

New York.

SEVENTEEN-YEAR LOCUSTS.—West Virginia is to enjoy the society of a brood of seventeen-year locusts in 1914. This brood will appear in 37 of the 55 counties, with perhaps straggling specimens in a few others. Most of these counties lie in the northwestern part of the State. The West Virginia Experiment Station at Morgantown has issued a bulletin on this locust, which gives a very full description of it. We had an extensive brood of this insect in Northern New Jersey two years ago. On our own farm it did very little damage, but on the hills a mile or so away, many young trees were seriously injured. We found no practical way of fighting the insect. Some remedies are suggested in this bulletin, but from our own experience we have not found any practical way of preventing danger. Our advice to those who are in the district where this locust is to appear, is not to trim their trees this Spring at all, but to leave the trimming until after the insect has come and gone.

MORE ABOUT BAY WAX.—Since writing my reply to the bayberry wax inquiry a few weeks ago one of my boy friends down in Rhode Island has supplied me with a sample of fresh gathered berries, and I find that simple boiling gives about a quarter of the wax present, about an ounce to the pound. Pressing hot gives more, removing the outer coat where all the wax is, and pressing that hot, gives more yet, and the largest quantity, all present in fact, which is about a quarter of the weight, is obtained by extraction with a volatile solvent, such as ether. But this process is inadvisable for the amateur on a small scale, and on a large scale requires special and rather expensive machines. I am told that the production of the wax is rather wide-spread, but that the fancy candle trade takes most of it, and the demand is irregular. Still, quite a quantity is made, one concern spoke of handling 15 to 20 tons a year. But the wholesale price, which is apt to run below 25 cents a pound, does not offer much return unless labor is very cheap. F. D. C.

"5130"
How a Number Achieved Personality

The little tailor of the story books, sitting cross-legged on his bench, snipped and stitched and pressed—making a thousand motions to do what could better be done by a hundred, and never doing the same thing twice in the same way.

He had no chemical test to make sure his fabrics were pure wool, no test for strength, no expert to pass on his workmanship but himself.

He never realized what could be done by analyzing every operation in making a suit of clothes; and then *perfecting those operations individually.*

The extreme opposite of the little tailor is the Scientific Tailoring of Clothcraft Ready for Service Clothes where each single operation is the task of a different individual, trained to do it in the one best and shortest way, helped by expert instructors, following methods established by the ability and experience gained in sixty-eight years of scientific clothes-making.

Clothcraft No. "5130" Blue Serge Special, $15.00

The number of ways in which quality has been increased and cost reduced by Clothcraft methods is literally measured by hundreds. The saving goes into better materials, better designing and many other points of added quality.

If it is better to do a thing by hand, it is done by a more skillful hand. If it can best be done by a machine, you get the benefits of the best machine to be had.

Why should each individual suit be cut separately—no one exactly like the pattern—when twenty can be cut at once, with mathematical accuracy?

Why should material be trimmed by hand, when a sharp knife attached to a swift-running machine, trims it with an accuracy no hand could achieve, and does it *while it is being stitched?*

Sometimes the best way seems more expensive. It costs more to heat irons by electricity than by gas; but it is better for the worker's health—for he does not have to labor in a heated, fume-laden atmosphere—and his increased efficiency offsets the extra cost.

Thus we make better men and women of our workers, and better clothes for you. It enables us to make "5130," a blue serge suit for $15.00, in nine different models, suiting men of different tastes, size, weight and age.

The recent reduction in the tariff on wool has enabled us to give you this year a finer quality of guaranteed all wool blue serge than ever.

"5130" is merely the last concrete expression of the Clothcraft idea. Clothcraft includes many other fabrics and patterns. It is the *one guaranteed all wool* line at $10 to $20.

THE JOSEPH & FEISS CO. 635 ST. CLAIR AVENUE, N.W. CLEVELAND, SIXTH CITY
Established 1846—Oldest American Makers of Men's Clothes
There is also a full-weight Clothcraft Blue Serge Special at $18.50 known as 4130

This Label In Every Clothcraft Coat; our Signed Guaranty in the Pocket

Drop in at the Clothcraft Store and try on one of the models of "5130." You will probably find an advertisement of the local dealer in the paper you read. If not, we shall be glad to send you a note of personal introduction.

Meantime write us for the new Spring Style Book and a sample of the cloth used in No. 5130.

The Home Acre.

Spray to Destroy Dandelions.

1. Can you tell me what I can use to spray a lawn with, which is very badly infested with dandelions? It is impossible to plow it, and I would like to get something that would kill the dandelion and not the grass. Digging them would be impossible, as they are too many. 2. Where could I get English hawthorn and Spiræas? M. S. R. B.

1. The spray used to eradicate dandelions in lawn is iron sulphate, 1½ to two pounds to a gallon of water. Spray two or three days after mowing, and do not mow again for two or three days afterwards. The spraying should be done on a bright sunshiny day. A heavy wetting within two days after spraying destroys the weed-killing power. Spray at intervals of four to six weeks. 2. Any of the nurseries advertising ornamental stock will supply hawthorn and Spiræas.

Composting Pine Shavings.

We use pine shavings mixed with straw in our henhouse for litter. As the shavings are not good to put on the land in their present condition, can you tell me how to cause them to rot after making piles outdoors with other material, such as manure from horses and waste vegetables? How long should they lie before using? G. A. C.

Long Island.

This litter might be put right into the ordinary manure pile, or mixed into a compost with horse manure and other vegetable matter. After three months of heating in such a pile it ought to be in proper condition for use. The trouble with the pine shavings is that they contain an acid which may be injurious to the soil. Soaking the shavings with liquid manure, or thoroughly fermenting the shavings in the manure pile will get rid of this acid.

Wood Ashes and Bone Meal for Garden.

What is the value of wood ashes mixed with bone meal as a fertilizer for vegetable garden? What are the proportions of the two ingredients and what quantity of the mixture should be used? M. R.

Three parts of wood ashes mixed with one part of fine bone meal give a fair combination of lime, phosphoric acid and potash with a small quantity of nitrogen. This combination would not be the best one for garden or truck growing, as the nitrogen is not available enough. By adding one part more of nitrate of soda you would have a very fair mixture for your garden. We should not try to mix the ashes and bone, as the ashes are too fine. They may be spread by themselves, and harrowed in, and the bone and nitrate mixed and applied separately.

Cover Crop With Small Fruit.

I intend planting, in a few days time, a field in berries seven feet by three feet (rows). Will it be practical to sow later on this year Canada peas between the rows, the object being two-fold—nitrogen and humus gathering—and the peas to feed pigeons? I suppose the vines could rot on the ground till next Spring and then be turned by plow. This would not, I presume, hurt the berry plants. I also propose to plant Kafir corn in another portion of the field. D. E. S.

Centre Moriches, N. Y.

We would not advise you to sow oats and peas, or peas alone, between the rows of small fruit. If it should be a dry season both crops would suffer. You would get a very unsatisfactory crop from the oats and peas, while the berries would make a poor growth, and they would not recover this season. You could put a row of early potatoes midway between the rows of fruits, and if you gave them thorough cultivation both crops might get through, but it would be a mistake to sow a crop like peas or oats under these conditions. In a very wet season you might possibly get a fair crop, but under ordinary conditions there would be a failure. The fruit ought to be cultivated with great care all through the early part of the season, and this would pay much better than attempting to grow a double crop when there is not moisture enough even for one.

Whitewashing Orchard Trees.

Can you give me any information about whitewashing the trunks of orchard trees? I do so principally on account of the neat effect it gives. Would it be advisable to put carbolic acid or something of that nature in the whitewash, and would that discourage insects crawling upward from the ground? Is there anything better? What can I put in it to make it stick? I was told last year that a handful of salt to each pail would fasten it on, but it did not seem to work. F. P. F.

Bound Brook, N. J.

We should use a lime and sulphur mixture, about as it would go on the dormant tree, with enough milk of lime added to make a whitewash. This would not be perhaps as neat as the pure lime wash, but it would make a more useful application. A small quantity of salt stirred into the wash, or a little liquid glue thoroughly stirred up, will make this material stick.

Heating Frame With Lantern.

In a recent issue of your paper a correspondent told of heating a hotbed with a lantern. Can you give me more definite directions for using same, as I am unable to get good heating material? I wish to plant two 3x6 frames to tomatoes. Does not this seed require bottom heat? Wouldn't I have to keep sash raised all the time to allow for air?

Norfolk, Conn. C. C.

Those who have tried out this method of heating frames, claim it is all right. If the temperature overhead is kept high enough, bottom heat is not absolutely necessary, but without bottom heat the plants will be much longer in coming up and be somewhat slower in reaching planting-out size, but will in most instances be a little hardier than those raised with bottom heat. When lanterns or any other like method of heating is employed it will be necessary to admit more or less fresh air at all times, the fresh air inlet being regulated according to the outside temperature and the amount of breeze stirring. The cooler the air outside, the less the sash will need to be raised. This also applies when much breeze is stirring. It does not require a great amount of fresh air entering the frames to keep up a supply of oxygen for an ordinary lantern, and the operator will soon learn how to regulate the supply, minimizing the supply to just within the line of safety.

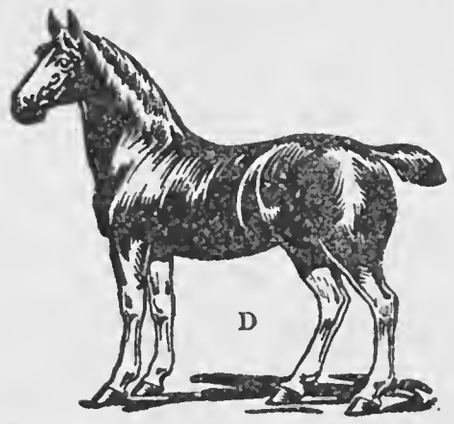
Make Your Lame Horse Sound, Like This

You Can Do It While He Works.

We want to show you that there isn't any affection that causes lameness in horses that can't be cured, no matter of how long standing. We want to send you our instructive book, "Horse Sense" No. 8.



It describes all. And with the book we want to send you an expert's diagnosis of your horse's lameness. All this is absolutely free. Simply mark the spot where swelling or lameness occurs on picture of horse, clip out and send to us telling how it affects the gait, how long animal has been lame and its age.

We absolutely guarantee Mack's $1,000 Spavin Remedy to cure Spavin, Bone or Bog Spavin, Curb, Splint, Ringbone, Thoroughpin, Sprung Knee, Shoe Boil, Wind Puff, Weak, Sprained and Ruptured Tendons, Sweeny, Shoulder or Hip Lameness and every form of lameness affecting the horse. We have deposited One Thousand Dollars in the bank to back up our guarantee. Cures while he works. No scars, no blemish, no loss of hair.

Your druggist will furnish you with Mack's $1,000 Spavin Remedy. If he hasn't it in stock, write us.

Price $5 per bottle, and worth it. Address McKallor Drug Co., Binghamton, N. Y.

Studebaker

WAGONS BUGGIES HARNESS

Oregon Pioneer has used his Studebaker ever since 1874

OREGON territory was largely settled by sturdy pioneers who, with their household effects packed in equally sturdy Studebaker wagons, made possible the great state of Oregon.

An interesting letter from Mrs. Sarah A. Haughton, of Norway, Oregon, tells of the wonderful record of a Studebaker wagon bought in 1874. In part Mrs. Haughton states:

"My late husband bought our Studebaker wagon in May, 1874. We loaded all our household goods and 6 months' provisions, tied the chairs outside and started for Oregon. The roads were so muddy in places we could not see the hubs of the wheels. There was only one other wagon in our neighborhood and that has gone to pieces long ago, while our wagon is still in good working order. My son recently hauled 41 boxes of butter, each box weighing between 65 and 66 pounds, and the roads were pretty bad."

IT PAYS TO BUY A STUDEBAKER

Thirty-nine years of hard work—and a good wagon yet. A marvelous record, but nothing unusual for a Studebaker. Other wagons go to pieces, and owners have to buy new ones, but a Studebaker wagon lasts a lifetime.

Studebaker wagons *are built to last* and to stand up under rough usage. It is true a Studebaker may cost a few dollars more, but the long service it gives makes it the cheapest wagon in the end. Don't listen to the dealer who wants to sell you the cheap wagon represented to be "just as good" as a Studebaker.

If you want a wagon that will last, run easily and stand up to its work, there is only one wagon to buy—and that's a Studebaker. Studebaker Buggies and Harness are just as good.

Studebakers last a lifetime

1913 RECORD

Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

CHRYSANTHEMUMS AND CARNATIONS.

Can you recommend something on the culture of Chrysanthemums and carnations? I wish to raise them on a small scale and would like a few pointers.
D. D. L.

1. Chrysanthemums are grown from cuttings produced by plants of the previous year, which are given a rest and cut back after flowering. The stools or suckers produced when started into growth give ample material for cuttings. The cuttings are inserted in sand, in a greenhouse, with bottom heat. Time of propagating varies from February to the end of May, according to the use made of the plants. Cuttings may be taken about June 1 and rooted in sandy soil in a spent hotbed; these should be lifted and potted about the middle of August, when they will make nice little plants. The Chrysanthemum dislikes a close stagnant admosphere under glass, and calls for abundant fresh air. Directions regarding soil and general treatment of Chrysanthemums were given on page 340, issue of March 7.

2. Carnations are propagated by cuttings made from strong lateral shoots, which are inserted in sand in either a bench or flats; February is a favorable time for this, though cuttings may be made from December to May. Conditions are the same as for Chrysanthemums; a moderate temperature (55 to 60 deg.), plenty of air, and care in watering, as excess of moisture tends to induce diseases peculiar to the propagating bench. In the case of both plants, the cuttings should be shaded from bright sunshine. In about four weeks the carnation cuttings will be well rooted, and they may then be transplanted into flats or small pots, where they remain until planted out in the field. During the Summer commercial growers give field culture, which produces robust plants. They are set out in April or May, according to weather conditions, and many growers leave them out until September, but this is not conducive to early bloom. In some cases they are planted in greenhouse benches by July, and though this involves a great deal of work for two months of fresh air, it pays in the quality of bloom produced. The inquirer does not say whether he is planning to grow Chrysanthemums and carnations for cut flowers, or for the pleasure the plants will give, which causes some indefiniteness in answering, as regards later treatment of the plants. Greenhouse treatment of carnations calls for moderate temperature (50 to 65 deg.) abundant air, careful watering and syringing. Friable loam composted with one-fifth its bulk of well-rotted manure, is a congenial soil.

CONTROLLING THE WATER LEVEL.

"A study of soil water" (page 474 R. N.-Y.) suggests a subject I would like to have discussed by those capable of doing so. Can the ground water level be to any extent controlled? Believing that it can led me to try to so control it. I give result below. Most wells in our section of country, last Summer, went dry. It fell to me to pump water from a well which usually went dry during dry season. Last season was unusually dry, and wells went dry that were never before known to do so. From well in question we obtained water for house and stock. When pumping for stock I used leaky trough made of two boards that conveyed water to kettle from which stock drank. The trough leaked so that the stones of the walled well were kept wet and also kept the soil in vicinity of well partly saturated. The well did not get dry. I am satisfied that the affinity of the partly saturated soil by capillary attraction maintained the water in the well above the ordinary ground water level. Before trying the experiment on the well I told some neighbors that I believed I could maintain water in our well until after water had left their wells. They had a good laugh at me. My well is on higher land than theirs, and not so deep as theirs. Yet we had water when they had none. J. P.
Oswego, N. Y.

Ground-water levels are commonly controlled by means of irrigation. In the vicinity of Auburn, Cal., irrigation is carried on in part for the purpose of maintaining well supplies. In southern California projects are being conducted which have for their objects the distribution of flood waters over land surfaces into which they may sink and replenish the well supplies. In these instances surface waters are used, and it should be obvious that if water were pumped from wells for such purposes the ground-water level would be lowered instead of raised because of evaporation and transpiration.

The persistence of the well here mentioned cannot be logically assigned to the cause stated in J. P.'s letter. Any forces of attraction existing between the soil water and the water table are altogether incompetent in the control of the ground-water level. The largest consideration in the case described is that of sanitation. The Survey has repeatedly cited as examples of dangerously unsanitary wells, those into which polluted surface waters, such as would be found around a stock trough, may percolate.
GEO. OTIS SMITH.
U. S. Geological Survey.

Japanese Plums; Apricots.

1. My Japanese plum trees are bearing very young, except the Wickson which I had nothing but a few sample specimens. Are the Wickson trees less prolific than those of the other varieties? What is the life of the Japanese plum tree? 2. I had an acre of rye which I cut when it was in bloom, and cured as hay. The sheep eat it with relish, and leave not even enough to bed the stable although they get a pound of bran each a day, together with some hay and oats cut in milk. Am I right when I assume that the protein of the kernel is continued in the stem before the kernel forms? 3. What kind of trees are the apricots? Are they small ornamental shrubs? Is the fruit good? Do the trees bear and are they worth planting? W. B.

1. The Wickson plum is not considered a shy bearer, but it may need cross-pollination under some conditions. It may be that the other varieties are not near enough to the Wickson to pollinate them, or do not bloom at the same time but this seems unlikely, for the bees carry pollen, and most of the Japan plum trees bloom about the same time.

2. The food material that finally goes into the grain is in the stalks and when they are cut during that stage the food value of the forage is almost equal to the grain with the matured straw.

3. The apricot is a fruit tree that grows as large as that of any variety of peach and bears abundantly where the climate is right for it, if there are no insects to trouble the fruit. Apricot trees are as hardy as ordinary peach trees, and are usually healthy and vigorous. In the regions west of the Rocky Mountains the fruit is grown abundantly but in the Central and Eastern States the curculio usually stings it while very young and cause it to fall off, and apricot growing is a failure. H. E. VAN DEMAN.

Hope Farm Notes

During the past year I am sure there have been at least 50 letters much like the following:

"I want to write for the papers and magazines, and perhaps write a book or two. Tell me all you can about it. How do you advise me to start?"

In many cases I would not advise you to start at all. My advice is not worth much anyway. Writing good articles is like farming in one thing—unless you have "instinct" for it, all the study and labor in the world will never make the finished product. It will always be raw. I am no expert, and cannot analyze the subject, but here are a few suggestions:

MESSAGE.—In the first place no one should try to write articles or stories unless he can put an honest and true message into them. What is a message? Truth! The dictionary calls it "an official communication." In a writer it means an honest, self-denying desire to give his fellow men something that will help them to think or act along better and higher lines. Unless you can feel in your heart that you can deliver that sort of a message do not try to write articles or stories. There are writers who spin out words as a spider spins his web. The spider may catch flies by his spinning, but these words catch few human souls, for unless there is a message in them the words are soon blown out of memory.

WHERE IS THE MESSAGE?—In your own life and experience. Every week we have letters from people who say they want to write. They usually enclose letters of recommendation from people who say they have ability. My reply usually is to sail in and send a sample of their work. If I were buying a horse I should want to see him and drive him before paying the money. No use buying manuscripts "sight unseen." Most of these people ask us to give them a subject to write about. Now, with our great outfit of advisers, we know where to go with any ordinary question. We want original ideas most of all. So I tell these people to write not more than 500 words on some topic that they *know* about from actual experience, and which farmers *ought to know!* That simple test seems to discourage eight out of 10.

YOUR OWN LIFE!—It shakes a man up sometimes to sit down and ask himself—"What *do* I actually know which other men do not know? What can I give them as experience or advice which I know I can stand for even if the opinion were to carry me to the stake?" Out of that honest thought will come what I call the "message." Of course there are bumptions or "smart" people who have such a high estimate of their own opinion that they call it experience. I do not speak of them. They find their place for a "message" built upon any conceited opinion will finally change with a command to go far back to the rear seats of oblivion and sit down. What I mean by a message therefore comes out of your own life—not cut and dried like hay, but fresh and fragrant as clover—with a true desire to benefit someone. The young may come with a hopeful message of faith and confidence in that great beautiful future which opens before them. Older people may come with fire-tested experience—hardened by the years, yet true as steel. So the first point is—never try to write unless you have something to say—a message.

HOW DELIVER IT.—Here you come to the art of expression, which is a natural part of the writer. Many people kill themselves off through their "introduction." I had a fine old friend who could not start a letter without beginning: "I now take my pen in hand to write you a few lines." That was what you might call a self-evident fact. Of course he did. Everybody knew it. Who cares to be told what he knew before? Many a reader has dodged a fine article because the first part of it contained one of those dull and stale "introductions." Senator Roscoe Conkling had a great reputation as a forcible orator. His plan was to open with the strongest brief statement of his case, and then go on and prove it. That startled his audience, and they had to go on with him. At the great convention where Garfield was nominated in 1880, Senator Conkling supported Gen. Grant for a third term. He got up to make his speech under the most depressing conditions. The convention was against Grant, and the delegates were tired out by long speeches. Had Conkling led up to his subject as others had done, few would have listened to him. He knew how to put flowers on his "message." He looked over that great angry audience and said slowly and deliberately:

"You ask whence comes our candidate?
Our answer it shall be
He comes from Appomattox
And its famous apple tree."

What a yell went up. The great building rocked. In 20 words Conkling had put before them a glorious vision of Grant the soldier. It obscured their view of Grant the man, and they listened breathless for what was to follow. In many cases, not all, our writers may imitate Conkling and start off with a forcible paragraph to attract attention. At any rate, get into the heart of your subject at once and do not spend good words bowing and scraping and clearing your throat at the door of your reader's mind. That might have answered years ago when papers and magazines were few. Now there are half a dozen chasing each reader.

BE NATURAL.—I cannot understand why the average writer thinks he must get up on stilts whenever he starts to write his thoughts on paper. Some years ago I had studied so-called French for two terms at an agricultural college. Quite a distinguished Frenchman came to town, and I was brought out to talk to him. I should have known better, but I started what I now realize must have been something awful to the Frenchman. That polite gentleman listened in a puzzled way and then shrugged his shoulders and said: "Pardon me, but I do not understand dis new language. My English he quite bad, but I do my best."

Now many of our farm writers have a glorious message to present, but they seem to spoil it as I ruined my reputation as a French scholar. The message they have is a part of them—a sweet, homely, heart-pulling story just fitted to their plain words and shrewd expressions. When they write it out they use strained, stilted expressions, great big words and disjointed sentences which do not fit the thought at all. I have had people tell me that they were on the watch for big new words that they might fire them off in their writings, and thus gain a reputation for wisdom. A very foolish plan that; I would take great pleasure in chopping such words out of manuscript. There is a paper printed at the Tuskegee, Ala., negro college called "The Negro Farmer." One of its departments has this heading:

THE "BIG WORDS" AND
EVENTS EXPLAINED.
Farmers' Dictionary.

That is one of the most sensible things I have yet seen. There is hardly a paper in the country that would not do well to start such a dictionary, and in each issue I will agree to find a dozen words which ought to be explained to 80 per cent. of the readers.

PLAIN TALK.—I cannot make it too plain to the would-be writer that 75 per cent. of the people of this country *think* in words of one syllable. They read long words and understand some of them, but their thoughts run upon the wheels of short and common words. The average man and woman may really understand 400 different words. Nine-tenths of their talking and thinking will be done inside this limited list of tongue tools. If you want to carry your message to them get down where they live—into the language they speak. I cannot tell you how to write or how to put words together. The truth is I never was taught. At 25 years old I doubt if I could have given the distinction between a verb and adverb or an adjective. I shall have to confess that in place of the analysis of sentences which grammars give us I put words together by instinct or by the way they looked in groups. I read good English by the square acre and in this way came to group words together as I suppose an artist groups colors or a carpenter joins pieces of wood. There never was any excuse for this. A thorough study of grammar and the analysis of a language is the true way to understand it. I began at the other end and tried to work down. A great mistake—which my children shall not repeat. My daughter at college is selecting her studies for the second year. My advice is to make a thorough study of English the foundation of her education, and to group around this those things which are closest to it, and which will help her most in giving expression to a message. For that is about all there is in life—giving the message which we work out with toil and pain, or which comes to us by inspiration.

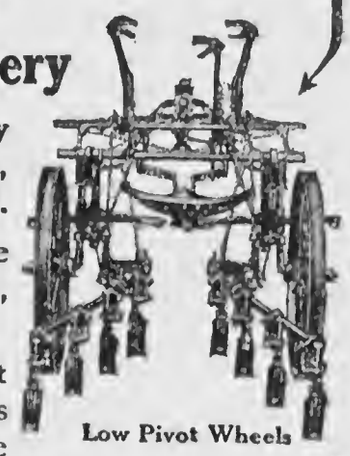
GOOD NATURE.—Do not hand out a "gronch" to the public or to your friends. A "gronch" is the germ of a mental disease. There should be a law against spreading all such. The world loves a cheerful writer, and will follow him if he carry a message which they need. In time of adversity they may come back to Jeremiah for a time, but their life will be cast with the hopeful heart and the patient mind. Be good natured, "loosen up" and learn the true distinction between fun and foolishness. Cut it short. Take up one thing at a time. Tell what you know and then stop. Make a mental analysis before you start, and have clearly in mind what you are going to try to prove. Stay on the ground, use short words, cut out introductions and tell it naturally. Never preach at your audience. Never play schoolmaster, and do not sneer at anyone. The best way to begin is to study your paper or magazine, and if you find a statement which you know to be wrong write a short and pleasant article correcting it. Do not criticise opinions so much as facts. If you can, from your own knowledge, prove that a printed statement is not correct you will help the paper and what you write will receive attention. But make it short and to the point. Do not write long articles and then count the words and write the number on the first page. The editor does not care how many words you write—it's their quality that he is after. To sum it up, boil yourself down and tell it naturally, be honest and keep good-natured. H. W. C.

POTATO GROWERS

Everywhere realize that the profits from any stand depend, largely upon choosing the tools that are designed especially for potatoes—that carry every convenience and every adjustment to handle the crop in the most practical way, from planting until after the harvest.

You can find everything that is needed in the full line of

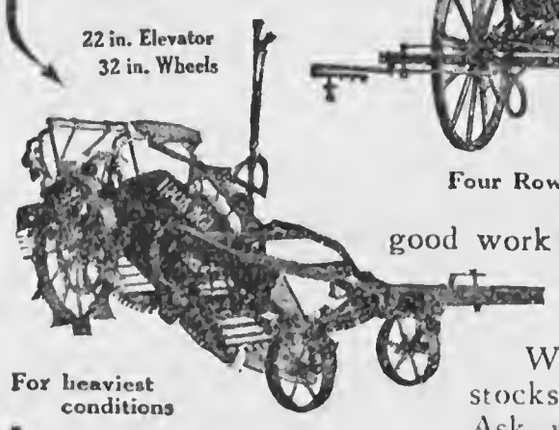
IRON AGE Potato Machinery



100% Planters place one seed piece in every space and one only—no skips to eat up fertilizer, labor and land, or doubles to waste expensive seed.

Steel-Frame Riding Cultivators are made with high or low, pivot or fixed wheels, grooved, flat or zig-zag gangs, for one or two rows, etc.

Traction Sprayers cover four or six rows at a time. Special spray bars for different crops including a new one that covers the underside of the leaves as well as the top.



Potato Diggers are made in four styles and when rightly chosen each is guaranteed to do as good work as any other digger of the same size and capacity on the market—better than most.

We have thorough distribution of stocks. Now is the time to order. Ask your local dealer to show you these tools and write us for set of booklets showing them in illustrated form.

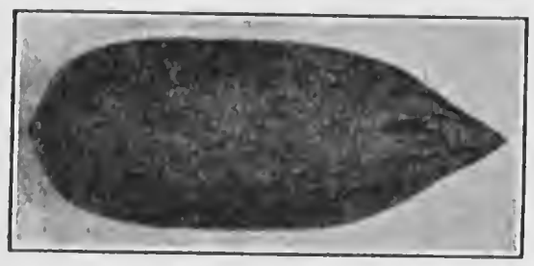
THE CARMAN PECAN.

Just 21 years ago I sent Mr. E. S. Carman, the great hybridizer, specimens of the Carman pecan. He had a half tone illustration made of it which appeared in THE R. N.-Y. at that time. The illustration of the Carman given with this article is from the half-tone engraving that he had made.

I have fruited the Carman pecan 21 years, and am now able to give a pretty fair estimate of its value. Every month in the year men are sending me specimens of new pecans, and asking my opinion of them. My invariable answer is that I must fruit a pecan at least 15 years before I can pass upon its merits. The old way was to select a variety because the nuts looked large and fine, and propagate it without knowing anything further about it. The results are that the country is overstocked with varieties that are poor bearers, and that are badly diseased, and the kernels of which break in coming out. A few years ago I gave a definition of the perfect pecan, which has been pretty generally accepted by the horticultural world. It is this: A variety that comes into bearing early, and bears heavy annual crops; one that is a healthy vigorous grower, the kernels of which come out whole and the nuts of which are large enough and the flavor



THE CARMAN PECAN.

fine enough to sell well on the market. Finally, a variety that ripens early in the season. Now Carman has all these virtues. I have sold Carman all over the North to the most critical class, and they have given universal satisfaction. They have invariably come back for more. Carman has also been fruited by Prof. Van Deman upon his plantation, and he is much pleased with it. He writes: "I consider the flavor fully equal to Schley. I believe it well worthy of introduction." Now when we consider the fact that Schley is thought to be the finest flavored of all pecans, we see how great Prof. Van Deman's praise is. But the Schley is a poor bearer, and the worst diseased of all pecans, while the Carman is perfectly healthy, and a tremendous yearly bearer.

Several years ago a man came to my place who had spent much time in investigating the northern demand for fancy pecans. He knew exactly what that demand called for. My crop of nuts was just ripening, and I took him through the whole grove showing him trees of all the standard varieties. He pronounced many of them good, but none up to the highest standard. Then I took him to a Carman tree. The ground was covered with the large long, whitish-colored nuts. He cracked several and ate them. His delight was great. "Exactly what I have been hunting for," said he. "This is the perfect pecan for the fancy Northern trade." And his words have proved true, for wherever I have shipped Carman pecans to a critical buyer he has come back for more. Mr. Geo. Long of Louisiana has also fruited Carman along with many other named varieties on his plantation, and he tells me that it is, by long odds, the finest pecan he ever saw.

Now a great many of the named varieties of pecans are badly diseased, and others are very poor bearers. It is utterly useless to plant any of these for commercial purposes. The man who selects his trees by looking at a few handsome nuts, is very foolish, and he is going to pay very dearly for his folly some day. The man who is in the pecan business, and who is not testing the Carman pecan, is standing much in his own light. Of all Mr. Carman's namesakes it is the one that is destined to carry his name longest to far-off posterity, for when a pecan tree is planted it lasts a long time, and when the merits of this variety are known it is going to be very largely planted. It is far ahead of Stuart in nearly every respect. But I have not the slightest doubt as to its future welfare; it is on of the varieties that has come to stay. Taking it all in all, the Carman pecan is the best variety I know anything about, and I say this after 35 years' experience in pecan culture. In conclusion, I wish to add that I am very very proud to have done this little to perpetuate the name of one of the world's greatest and noblest hybridizers.

SAM H. JAMES.

Louisiana.

A Plea for the Quail.

One Summer when I was a boy on the farm, my father had a large patch of peas planted, and before same had matured, we were bothered greatly by a large flock of blackbirds, this flock consisting of at least 500 birds. It is not necessary for me to dwell on the destructiveness of said birds in a pea-patch. I made frequent visits to the pea-patch in question, with a shotgun, and slaughtered all the blackbirds that I could. After making several trips, and shooting into the flocks several times, these birds naturally took the hint and began to give the peas a wide berth; however, on one of the last visits into the pea-patch, with the shotgun, after firing into the blackbirds as usual, when walking back through the peas, a quail unexpectedly arose, and wishing to determine whether or not this quail was feeding on the peas I raised my gun, fired and killed this bird. You can imagine my surprise on opening this bird, instead of finding any peas, I found nothing but a considerable number of grass seeds, small insects and one hard-shell potato bug, while this bird had not eaten a single pea. Although the fact of its eating a hard-shell potato bug was a big surprise to me, yet I have always advocated since that any bird of whatever species that would eat a bug of this character was and is too good a friend of the farmer to be ruthlessly slaughtered. Although this bird was killed by me, out of season, in order to find out whether or not it had been guilty of feeding on the peas, yet it has been the means of saving hundreds of these birds' lives, as, when I have been hunting, when the season was in, I have always made it a rule invariably to pass the "Bob White." I have written this, thinking that it might probably be of interest to a large number of your readers, and I believe that new laws should be enacted by our Legislature in protecting birds of this character.

C. E. SOUTHARD.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

The Rural New-Yorker has, at its command, the largest and most efficient corps of correspondents and advisers ever gathered by any farm paper in the world. Thus we can obtain for you the last word on any subject relating to the soil, its cultivation or its products, or the human life of the farm. This service is yours for the asking.

*

I HAVE just closed the most prosperous season I have ever had in the pecan business. The parcel post has worked greatly in my favor, and is far safer than shipping by express. I have shipped as far as the Hawaiian Islands by parcel post, and when the packages are insured there is no loss. When shipping by express there was constant stealing and fraud.
Louisiana. SAM H. JAMES.

Mr. James conducted an organized campaign for selling the nuts, just as though he had a manufactured article. He found the papers which are read by people likely to buy high-priced nuts. Then he advertised, paying in some cases over $2 for a single line. Then he made use of parcel post and took in some 100-cent dollars. It seems that some people thought parcel post was to help them whether they used it or not. Give a man a chance to borrow a hoe and it would not insure him a garden full of vegetables unless he worked that hoe hard. Parcel post means opportunity for many—a chance to develop some little business or save transportation charges. There are thousands of our readers who may do on a smaller scale what Mr. James did with the nuts. We are going right after this thing earnestly and patiently until our people see the point.

*

IN one way and another the New York daily papers are learning that there is such a thing as a 35-cent dollar. In the New York *Times* Thomas M. Upp gives this story by a worker on a daily paper:

His mother, a poor Jewish widow, made what are called "hickory" shirts, which farmers wear in the fields. For this work she was paid 35 cents a dozen, furnishing her own thread. The farmer paid 50 cents for the shirt. The poor woman paid nine cents a quart for milk which the farmer sold for 2½ cents. To get one quart of milk the woman must make three shirts. To get one shirt the farmer must sell 20 quarts of milk.

This incident could be duplicated thousands of times to show how producer and consumer are kept apart in order that the middlemen and carriers may reap the profits. The widow certainly secures her mite with the corners cut off when she must make three shirts in order that the farmer may secure 2½ cents. Or the farmer must pay 50 cents in order that this woman may be able to buy one pint of his milk. Such a system of distribution as this means is responsible for the 35-cent dollar. The agitation and battle over this clipped dollar has for its object a reorganization of this old system into more direct dealing between consumer and producer. What is needed most of all is understanding on the part of city people that the farmers are not responsible for high prices. The farmer is robbed worse than the consumer is held up. The poor widow making shirts at three cents each, and the dairyman selling milk at 2½ cents have interests in common. They should be friends and business partners, for in no other way can the 35-cent dollar be increased and the 190-cent dollar be reduced.

PROF. F. C. MINKLER of New Jersey is justified in "feeling good" over the sale of that $5,000 colt (see page 676). When the New Jersey Live Stock Commission decided to import heavy draft horses for breeding purposes there was much criticism from breeders of the lighter driving or carriage horses. These men seemed to think that the natural place for the big draft horse is in the West, while for some reason the Atlantic Coast is better suited for drivers. But did they stop to think that the great market for draft horses is in the great importing cities on the Atlantic? Why not follow the general advice, and get close to your market with what that market calls for? Again, it does not matter where a horse is produced provided he has the desired quality. And so New Jersey comes forward with a $5,000 colt, and there may be more to follow. Keep your eye on New Jersey, some of you gentlemen who think she has no purebred stock except mosquitoes!

*

I SUSPECT that a very great part of the trouble in our cherry and other trees going up in the air is that a tree has to grow in some direction, and if we plant so close that it can't grow in all directions, it has to take the only one left open, and go up. I have now a cherry orchard that, for the benefit of my grandchildren, I have no doubt I should thin out half the trees and let it spread. M.

This suggests a number of things. Most of us plant the trees in our orchards too close. There is a rage for "fillers," so that the land may produce fruit early and pay its expenses. Yet who ever saw a first-class orchard of well-shaped trees which was started with "fillers," and kept crowded through its early life? On the other hand, how much does a man owe to his grandchildren, anyway? What have they done for him, and to what extent is he under any obligations to them? It is human nature for a man of middle years in planting an orchard to wish to see the fruit and to make the enterprise pay. Thus he usually crowds the trees close and makes an acre produce all it can. We have no doubt that at 30 years old 25 apple trees to the acre would be more satisfactory than 40, but it takes a strong man to wait 30 years.

*

ONE thing we may surely thank the experiment stations for—that is the improvement in the quality of mixed feeds. A few years ago some of these feeds were awful. The "molasses feeds" were worst, because a sweet taste may disguise the poorest trash. There were vital weed seeds, splinters, dirt and stuff put into these feeds—enough, in some cases, it would seem, to make an ostrich sick. Samples were found containing 3 per cent. or more of sand and grit. Such stuff must have contained sweepings which were half sand. The experiment stations year after year printed just what they found in these feeds. This publicity has driven the worst of them out of the market. The weed seeds are now usually ground or cooked before mixing, and the "screenings" are of better quality. The poorest of the molasses feeds have been driven out of business. Those now sold are of very much higher quality than the poor stuff which formerly disgraced the trade. In this case the stations have done fine work. If farmers would read the analyses printed on the tags and sacks they could protect themselves to a large extent.

*

THOSE who like to consider large figures will be interested in this:

The volume of the saline matter in the ocean is a little more than 4,800,000 cubic miles, or enough to cover the entire surface of the United States, exclusive of Alaska, 1.6 miles deep. The volume of the 10-mile rocky crust of the earth, including the mean elevation of the land above the sea, is 1,633,000,000 cubic miles. One per cent. of the contents of the oceans would cover all the land areas of the globe to a depth of 290 feet.—United States Geological Survey.

The ocean has for ages received the washings of the earth. Vast quantities of plant food have been leached out of the soil and sent to the ocean, where most of it has been kept. Part of it has been stored up as food in the billions of tons of fish which inhabit the ocean. The quantities of lime and phosphates which have been built up in the ocean are beyond the power of the average mind to compute. The ocean water contains in solution every substance which the earth has known, from gold to sand. The ocean holds these great stores in reserve, waiting the time when man shall need them so badly that necessity will force him to find a way to extract them. A century ago farmers thought they could afford to throw ashes and cotton-seed into the river, and burn straw. To do so now would be to throw away money. Two centuries hence, and before, the treasures of the ocean will be needed, its food for plant and for man will be utilized and the power of the waves will be used to heat and light and move the world's machinery.

THE U. S. Supreme Court has upheld a law which gave the State of Kansas the right to regulate the life insurance business. The Kansas Commissioner of Insurance, under this law, ordered certain insurance companies to reduce their rates. These companies brought suit to prevent such reduction on the ground that the State has no right to interfere with private business in this way. One question involved was whether selling a man an insurance guarantee was to be considered the same as selling him merchandise. The court was divided—the majority holding that under the Kansas law the Commissioner has the right to regulate these insurance rates when it is evident that such rates are too high. The insurance business has developed in a way which gives it a public rather than a private character, and thus the court holds that it is, within certain limits, subject to State control of its rates or prices. Some of the lawyers think that this decision opens the way to State regulation of prices of merchandise or rates of labor and transportation, but a study of the case does not seem to warrant that opinion. Undoubtedly, however, the tendency is toward giving the State the right to prevent *extortionate* charges.

*

THE R. N.-Y. still sincerely hopes there will be no war with the people of Mexico. The blood-stained murderer and traitor who now calls himself President of the Mexican Republic should be punished, but this country has no quarrel with the Mexican people. They need our friendship and our help. We have no right to absorb their territory or to interfere with their real government. The situation is not unlike that in which many a good man has found himself. Over the fence, in the next house, lives a hateful, overgrown bully of a boy. He has mastered a good-natured father and a doting mother, and terrorizes the neighborhood. He whips your children, insults the women and throws stones at you when you talk to him about it. He isn't your size, and you are supposed to have some dignity and character; but one day you get hold of that boy. You forget your dignity and you put a shingle to him until he roars for mercy. His parents will probably both turn on you, when they ought to make you a present. The mother runs out to shed tears over the "angel child," and the father, insulted and bullied by the young imp, rushes to defend his heir. But you are more of a man because you gave way to honest indignation. No one wants war with the Mexican people except three small classes of people: the crack-brained jingoes, who fight mostly with their mouths; those who in one way and another might make some money out of a war, and those who believe that a good "war scare" will take the minds of the people away from vital reforms of politics and social problems. The clear-sighted men, who really wish well for their country, understand that a war right at this time would do more than anything else to stop the progress which has been made during the past few years.

BREVITIES.

"HOT *air*" is natural gas, but it runs no honest business.

IT is just as easy to teach an old dog new tricks as to break a new dog of old tricks.

IN spite of the hard Winter, Lake Superior will be open to navigation earlier than usual.

LAST year little Denmark exported $123,317,000 worth of provisions and imported $7,213,500 worth.

THIS is the season when "gentle Spring" tarries on the way, and asserts her "rights" to do as she pleases.

THE largest strawberry fields in the world are said to be in Hampshire, England. From this district last year 1,300 tons of berries were sent.

IT is not strange to learn that these Hampshire berry growers have organized to build a basket factory and buy their fertilizers.

THIS Fall the voters of Wisconsin will vote on the proposition to "recall" unsuitable public officials. This has passed two legislatures by great majorities.

IN Alaska the great sporting event of the year is a dog team race. The run is 412 miles over the frozen snow. This year the race was won by a team of Siberian wolves.

IN Australia "rabbit freezing works" seem to be operated somewhat like our creameries. They buy the rabbits from hunters, freeze them and ship to England. The price for a rabbit is eight cents, for a "kitten" two cents.

LAND BANK OF THE STATE OF NEW YORK

System of Mortgage Credits Explained.

PART I.

LOCAL AND CENTRAL ASSOCIATIONS.—The system of mortgage credits adopted for New York State provides for local associations all over the State without limit as to number, and one central association, called the Land Bank of the State of New York. Any person, man, woman or child, may be a member of the local association; but, of course, only land owners may borrow money from it on mortgage. Members not land owners may borrow only on the shares held by themselves in the local association. These local land banks will be the saving and loan associations now existing and those yet to be formed in the State. These saving and loan associations have been adopted as the local organizations because the excellent law under which they are authorized already exists. They are strictly coöperative, and have been universally successful.

A DISTINCTION IN ASSOCIATIONS.—These local saving and loan associations must not be confounded with the so-called National savings and loan associations, which were not coöperative and which can no longer be organized in the State of New York.

THE LAND BANK.—The local savings and loan associations will own and control the Land Bank of the State of New York.

FORMATION OF ASSOCIATIONS.—A savings and loan association may be formed anywhere in the State by 15 persons, either men or women. It can operate only in the territory embraced in a radius of 50 miles. The 15 organizers should all live within this territory; but if 15 people cannot be found in the territory, a smaller number will do, provided enough people to make up the necessary 15 will assist them from the outside. It is, however, desirable that the whole 15 organizers live in the community in which the society is to operate, and these can usually be found within a radius of 50 miles. Usually the associations confine themselves to much smaller territory. One local association will be sufficient for any particular neighborhood; but there is no restriction on the number of local savings and loan associations that may be organized in the same place.

THE FIRST STEP.—When 15 persons have signified their intentions to become members of a savings and loan association, a meeting should be called. It is a good plan to have a subscription paper prepared, and have those who favor the organization sign it, and set down the number of shares he wishes to take, and if this is not done previous to the meeting, then it may be done at the meeting.

EXPERT AID.—It is desirable that a public-spirited and reliable lawyer should be one of the organizers, if one lives in the neighborhood. If there be a bank in the district it is most desirable that one of the officers or a principal employee of the bank shall be among the number, and that a leading citizen of the community in sympathy with the movement and commanding the respect of his neighbors shall also be among the 15 incorporators. It would be well, of course, to invite a representative from some neighboring savings and loan association to attend the meeting and give some practical advice, which is really more essential than the legal counsel.

LEGAL REQUIREMENTS.—Before holding the meeting, the men who are moving in this matter should write the Superintendent of Banks, Albany, N. Y., and get from him a copy of the law, which is self-explanatory in regard to organization and is direct in its terms. With a copy of the law before them, the organizers would draw up an organization certificate making and executing three copies, one of which they would hold themselves and send the other two to the Superintendent of Banks.

PROPER FORMS.—There are two forms of organization permitted by the law. These are known as: (1) The "permanent plan," and (2) the "serial plan." The organizers should be careful to avoid the "serial plan" and adopt the "permanent plan," which is a system of coöperation between borrowers and lenders; and which has been adopted by practically all the progressive organizations of the State.

CERTIFICATE AND BY-LAWS.—Before doing any business or receiving any money, however, it would be necessary to forward the organization certificate, together with by-laws also acknowledged by the incorporators, to the Superintendent of Banks. A copy of the necessary by-laws for the associations can be had from the Banking Department, from the New York State League of Savings and Loan Associations, or from the office of THE RURAL NEW-YORKER. Changes may be made in these by-laws within the law to suit local conditions and preferences.

PASSING INSPECTION.—Before executing the organization certificate and the by-laws, it would be well to submit those by-laws for review to the Banking Department, so that when the certificate and the proposed by-laws are forwarded to the Superintendent of Banks there will be very little doubt but that they will pass inspection there. It is in this respect that the advice of an experienced association advisor is desirable. The State will furnish instructors and organizers for the present, and at any time arrangements may be made for a competent advisor on application to THE RURAL NEW-YORKER. The banking department will not only pass upon the papers submitted to it, but will make an inquiry into the character and standing in the community of the persons who are organizing the association, and will not issue a certificate of authorization unless it is satisfied in this respect.

The by-laws should contain a clause that the new association will become affiliated with the Land Bank, this privilege being one that every association in the State decides for itself. J. J. D.

THE NEW YORK FARM BUREAU SERVICE

The County Farm Bureau work of farm management, field studies and demonstration is rapidly organizing. It is new work, and actual results will be slow at first. If properly handled and not over-advertised or boomed this promises to be a very useful part of farm education.

THE DUTCHESS COUNTY FARM BUREAU was opened July 1, 1913, with its office in Poughkeepsie. It was made possible by a subscription of $1,000 from the County Committee Y. M. C. A. to start the work. $50 per month from the State was immediately available, and the New York Central Railroad pays $5 per month to the agent, and passes him over its lines. A county appropriation of $1,000 was made by the supervisors in November. The bureau has an individual membership of farmers at $1 per year, and has received some private subscriptions. The Government gives the franking privilege. The benefits of the bureau are open to members and non-members alike. The growing of Alfalfa in Dutchess County has not passed the experimental stage. Several farmers have planted their crop under the direction of the agent, and it is hoped that a successful method of culture may be worked out. Clover has not done well in the county of late, due partly to the dry seasons and partly to the lack of lime. When the agent commenced work no source of lime was freely available to the county at a satisfactory price and of good quality. Such a source was located, and the railroad was induced to lower the freight rate from $1.60 to $1 per ton to all points in the county along its lines. The first car from this quarry was shipped into the county April 13. The material all passes a 20-mesh sieve, and costs $2.50 in bulk delivered. It analyzes 97 to 98 per cent carbonate of lime. Orders for approximately one thousand tons are pending, and will go in as fast as they can be filled.

There is a general awakening in the county as to the possibilities in the apple business, and farmers with neglected orchards are beginning to take an interest in them. The agent is co-operating with several men who are renovating such orchards. Spraying requirements of the section are apparently somewhat different from the usual recommendation made by the State and Cornell Station for Western New York conditions. Accordingly a spray calendar for the amateur apple orchardist has been issued by the bureau after consultation with State experts. This has been given general distribution. Co-operative organization for various purposes has apparently been more valuable than any other single line of work. With the aid of the bureau a County Coöperative Association for buying farm supplies and selling farm produce has been organized. A branch of the National Housewives' League has been organized in Poughkeepsie. One cow-testing association has started work and two more are pending. Several cars of fertilizer and other supplies have been purchased coöperatively at a large saving from local prices. The bureau has done much in the way of bringing State and government experts into the county to study local problems. The agent locates problems of a similar nature which come under the knowledge of a single expert, plans a campaign of one or two days, and enables the man to do three or four times as much work in a given time as he could do working alone in a strange county. One of the Cornell Extension Schools was held in the county this Winter under the auspices of the Farm Bureau, and plans for this work next Winter are now under way.

THE DELAWARE COUNTY BUREAU has only been in operation one month, but in that month there have been many calls for the County Agent to visit farms and suggest better methods of farming. There have also been many farmers at the office, who read the papers and carry on discussions. During the past month the agent has held meetings in the county for the purpose of the Farm Bureau and getting acquainted with the farmers. We have a number of men who are to grow certain crops on their farms under the supervision of the county agent that will be of value to that community, as they will show what can be done with proper care. The crops that are of particular interest are, oats and vetch grown for hay, Alfalfa, potatoes and corn. We have one man who is carrying on an experiment in drainage. While the agent cannot go to each man's farm and accomplish results, as it would take too much time, the demonstration crops that will be grown will give some definite information regarding that crop in that locality. The Bureau will be able to help the farmers in the purchase of lime at a reduction. It is also the aim of the Farm Bureau to form several cow-testing associations, so that the farmer will not be keeping cows that are "boarders."

ERIE COUNTY.—The Farm Bureau movement in Erie County was started February 1st, yet there seems to be a great deal of interest manifested by the farmers of the county in the new movement. Much of our time up to the present, of necessity, has been along organization lines in the office and field, the manager of the bureau having spoken before 23 audiences scattered well over the county. One agricultural extension school in coöperation with the College of Agriculture, Ithaca, N. Y., has been held, at which there was a registered attendance of 83, the largest school held in New York State this year. At the present plans are making for an agricultural demonstration car to go through the county, also arrangements for four orchard field demonstration meetings in different parts of the county, giving actual field instruction and demonstrations on pruning and spraying, etc. Several Alfalfa experiments will be conducted, comparing northern-grown with southern Alfalfa seed. Already something like 60 calls on the farm have been booked for work with individuals on their individual problems, which will be taken care of as soon as the roads are passable.

IN ONONDAGA COUNTY elaborate plans have been made to carry on extensive work. An excellent pamphlet has been issued by the Farm Bureau. This was organized on April 15, 1913, with some of the most prominent farmers in the county on the council and committees. The first thing the council did was to buy a motor car, so that the agent might get over the county rapidly and become acquainted with the farmers. This enabled the agent to get into every township and visit personally over 200 farmers. He has talked before every live Grange in the county. Dairying is the great farm interest in Onondaga, and the improvement of the dairy herd is the most serious problem. Even in this famous section of Alfalfa, lime and Holstein cattle, it is thought that the majority of the cows do not pay their way. They are capable of doing so, but fail through poor feeding, care, and housing. Two cow-contest associations have been formed, and cow-testing contests are being held in various parts of the county. Experiments in killing out wild mustard by the use of sprays are being tried. Farm surveys are to be made, and in connection with the feeding of dairy cattle, farmers will coöperate in selecting a good grade of dent corn suitable for the county. A start has been made with the old Onondaga White variety, which seems well suited to the locality. The proposition is to study this variety and develop it so as to adapt it particularly to local soil and climate. This bureau has a farm loans committee, and it also seeks to investigate and adjust, if possible, complaints made by its members in dealing with the public service companies.

The Buyers' and Sellers' Exchange has proven a complete success and bids fair to assume large proportions the coming year. A large number of people have been induced to use milk record sheets and lime, and to adopt better methods of cropping. We have inaugurated a system of permanent fertility, which proves to be successful and valuable to farmers, both in saving fertilizer bills and increasing yields. A number of people are using raw rock phosphate in contact with decaying organic matter, beginning this year. The work in renovating several old orchards is proceeding admirably.

NEW YORK STATE NEWS.

NEW FRUIT TREES.—Governor Glynn has signed Assemblyman Gillett's bill with regard to selling of fruit-bearing trees. This law requires that all fruit-bearing trees shipped from any point in the State shall have attached "to each car, box, bale or package a copy of a certificate of inspection issued by the Department of Agriculture and signed by the Commissioner of Agriculture, valid to the first day of September next following the date of issuance thereof." Labels specifying the varieties or names of the trees must also be attached. The law also provides for the recovery of damages if any of the trees prove untrue to name. It also requires all agents selling fruit-bearing trees to carry a certificate in writing showing authority to act as such agents. The act is to take effect on September 1 of this year.

"SIX DAYS SHALT" WITH EXCEPTIONS.—The bill introduced by Senator Brown to amend the law in relation to Sunday labor has become a law. It exempts from the provisions of the act which would limit labor to six days the week, the "employees in dairies, creameries, milk condenseries, milk powder factories, milk sugar factories, milk shipping stations, butter and cheese factories, ice cream manufacturing plants and milk bottling plants."

ANOTHER LAW.—Senator Godfrey's bill amending the charter of the city of Jamestown has been approved by the Governor. It authorizes the common council, on recommendation of the board of health, to acquire a municipal plant to handle and distribute milk, after the taxpayers have voted in favor of the proposition. We believe this is the first instance where a municipality has undertaken to handle the milk supply for the city.

LABOR DEPARTMENT ACTIVITY.—The Department of Labor was certainly busy during the month of March, according to a report recently issued by the department. Its agents inspected 5,731 factories, 3,293 mercantile establishments, 1,888 tenements and four mines. There were 24,341 orders issued during the month to factories, and of these 8,665 were in regard to fire protection. The department stopped work in 122 factories that were unclean, and seven factories were prosecuted on account of unsanitary conditions. During the month 18,982 visits were made by inspectors to determine whether or not orders of the department had been obeyed.

INSPECTING DAIRIES.—The work of inspecting every dairy in the State where cows are kept under the Bang system is under progress at this writing. This is done at the order of Commissioner Huson, who proposes to know what are the facts in the case in respect to the protection of the public against any possible danger of tuberculosis being transmitted through milk or the eating of veal. There are about 700 cows on 125 farms that are kept under the Bang system, and if it is discovered that they are not being kept according to agreement, that agreement will be canceled promptly.

GENESEE FRUIT GROWERS.—The Genesee County Fruit Growers' Association is planning to wage war against the San Jose scale this Spring. Two experts from Cornell will remain in the county for the Spring and Summer, and they will visit all orchards of the members of the association as soon as practicable. It is said that they will use a new formula for the spray, the ingredients of which will be made known to members of the association. This, if true, may be a good way to increase membership in the association, but it isn't a good way to cope with the scale. Unfortunately the scale is no respecter of horticultural associations.

OTSEGO FARM BUREAU.—The largest county farm bureau association in the State is that of Otsego County. It had a charter membership of 470, and now 628 farmers are connected with the bureau. The aim is to bring the number up to 1,000. This is by far the largest association of its kind, as Oneida, which stands next, has but 260, if we are correctly informed. Of course benefits are nowhere limited to members, but in a way every farmer in the county must receive benefit from the bureau's operations. Floyd S. Barlow, of New Brunswick, N. J., was chosen agent of the bureau, and he has been holding meetings all through the county to get the farmers interested in the movement.

STATE FAIR COMMISSION.—A meeting of the State Fair Commission was held in Syracuse April 30. At this meeting Commissioner Huson presided, and many details of the next fair were worked out. The premium lists for the fair are to be ready for distribution by June 1, and already a number of former exhibitors are applying for reservations. J. W. D.

Woman and the Home

From Day to Day

It Isn't the Thing You Do.

It isn't the thing you do, dear,
  It's the thing you leave undone
That gives you a bit of a heartache
  At the setting of the sun.
The tender word forgotten;
  The letter you did not write;
The flower you did not send, dear,
  Are your haunting ghosts tonight.

The stones you might have lifted
  Out of a brother's way;
The bit of a heartsome counsel
  You were hurried too much to say;
The loving touch of the hand, dear,
  The gentle, winning tone,
Which you had no time nor thought for
  With troubles of your own.

Those little acts of kindness
  So easily out of mind,
Those chances to be angels
  Which we poor mortals find,
They come in night and silence,
  Each sad reproachful wraith,
When hope is faint and flagging
  And a chill has fallen on faith.

For life is all too short, dear,
  And sorrow is all too great,
To suffer our slow compassion
  That tarries until too late;
And it isn't the thing you do, dear,
  It's the thing you leave undone
Which gives you a bit of heartache
  At the setting of the sun.

—Margaret E. Sangster.

*

STERILIZED bran, put up in packages like other cereals, is now sold by grocers, all ready for making bran bread or biscuits.

*

A CAKE cooler is inexpensive, but very useful; it consists of heavy tinned wire netting mounted on a raised frame, which permits the air to circulate under as well as around the cake. It is excellent for cooling bread also.

*

THE tender young sheep sorrel, which later is such an eyesore as it reddens the fields, makes a wholesome and delicious soup. Wash two quarts of the leaves very carefully, and cook till tender in a small quantity of water. Rub through a sieve, add seasoning, and three cupfuls of soup stock. Then make a paste of one tablespoonful of butter, rubbed smooth with one tablespoonful of flour, and use this to thicken one teacupful of hot milk. Add this to the soup, stirring well to keep smooth; let it boil up, and serve with croutons or heated crackers.

*

SUMMER is likely to come with a rush this year, judging by the late cold Spring. It sets work back in the house, as well as out of doors, for housecleaning that involves the moving of stoves cannot be done this chilly weather. In many places Summer work will be pressing before Spring work is over, both indoors and out. It will be a good season to think about "standardizing" the work to make one effort take the place of two. Just think, as you go about the house, where your greatest loss occurs, in time or energy; if it seems to present a problem you are unable to solve alone, perhaps the combined wisdom of others will provide a solution.

*

BEEF pie with potato crust is an old-fashioned English recipe for using cold roast beef. Boil five large potatoes in salted water; when done, slice a layer of them in a baking dish; then place a layer of meat, and salt and pepper, also celery salt; then potatoes and meat, and so on until your dish is full. It will take a teaspoonful of salt, a half of pepper and a saltspoonful of celery salt. Mash the remainder of your potatoes, which should make about a cupful; add one tablespoonful of butter. When cool, add one well-beaten egg, one cup of milk, one-half teaspoonful salt, and beat all together until very light; then work in enough flour, to which you have added one-half teaspoonful baking powder, to enable you to roll out in a sheet. When you have poured over your meat and potatoes a gravy which you have made from the scraps of fat and bones, place this paste over all, cut a cross slit in the middle and bake. A slice or two of onion improves this pie to those who like the flavor. It is very savory and nutritious.

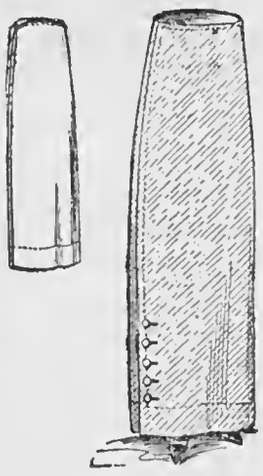
The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired. Price of each pattern 10 cents.

8223 Plain Guimpe, 34 to 42 bust.

7740 Child's Romper, 2 to 8 years.

8226 Child's Dress, 2 to 8 years.



8066 Two-Piece Skirt, 22 to 32 waist.

7731 Corset Cover, 34 to 42 bust.

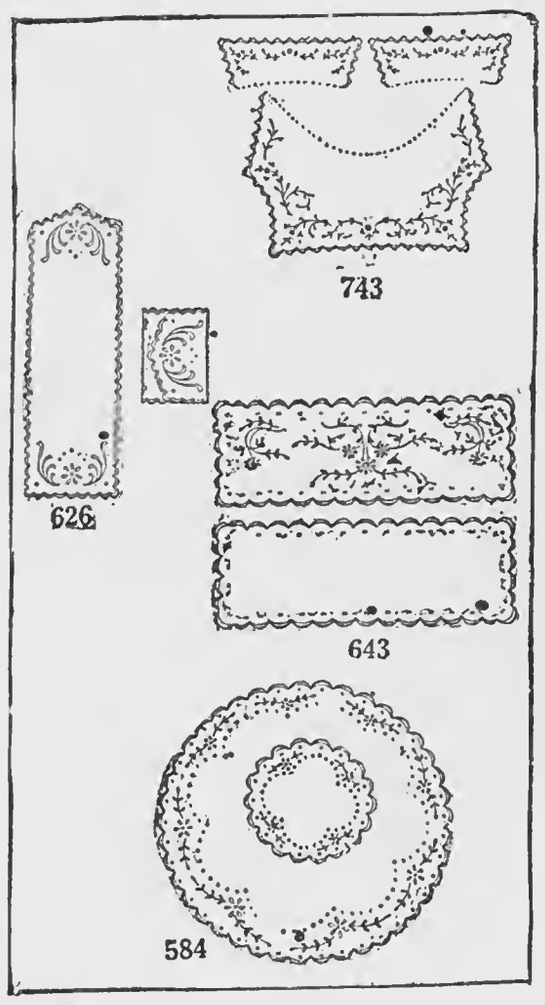
7609 Utility Caps, One Size.

Embroidery Designs.

The prices quoted are for stamped goods and material for working but transfer patterns of any design will be furnished separately for 10 cents each.

No. 743. A design for embroidering a child's sailor collar and cuffs. The scalloped edges are to be buttonholed, the leaves, petals and dots can be worked solidly or as eyelets. Stamped on linen lawn with mercerized floss to work, 25 cents.

No. 626. Design for embroidering a folding case for pins or veils. Stamped



on best white pure linen, with mercerized floss to work, 15 cents.

No. 643. Design for embroidering a pin-cushion cover having scalloped edges. Stamped on best round thread white linen, with mercerized floss, 50 cents.

No. 584. Design for embroidering a hat with scalloped edges. Stamped on pure white linen, with mercerized floss to work, 45 cents.

Seen in City Shops.

High collars, coming down in a low point in front, are a prominent feature in this season's styles; practically all of the blouses show them, whether silks, chiffons or wash goods. These collars do not include the Medici ruff of last year, which is now old-fashioned. Some of these collars are about the style of those worn by men when Madison was President, and have a cravat ribbon of black satin to hold them up; others resemble those shown in portraits of Lord Byron. These collars are not wired, but stiffened with starch. While standing erect, these collars roll outward, and thus do not come against the hair, while the sharp points stand out at either side of the face.

Colored separate waists have been out of style for a season or two, but they are now very much worn, both in plain colors and flowered materials. For an inexpensive, yet very pretty blouse, flowered voile is admirable, an excellent pattern being No. 8132, shown on page 231. Select a becoming color, and one that harmonizes with the jacket suit. A flaring stand-up collar may be worn with this blouse.

Some wonderful new underwear from Paris is made of fine handkerchief linen, trimmed with striped linen, narrow stripes of blue or rose on white.

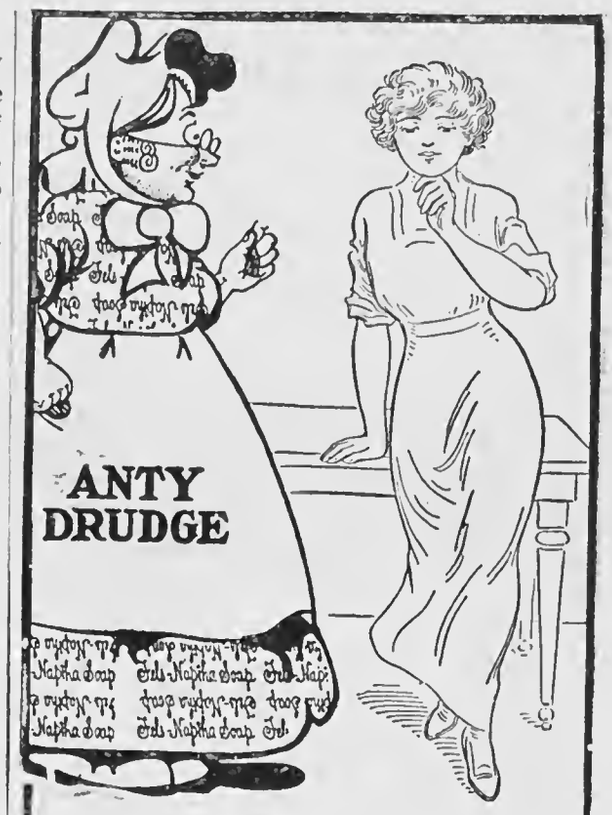
Among fashionable Spring shoes is a pump with two straps over the instep. Very sensible, as well as stylish, are women's patent leather pumps made just like a man's dancing pump, with low flat heels and no trimming except the usual grosgrain bow.

Panier tunics are a pretty model for the popular flowered materials, such as voile or crepe. A pattern for such an overdress was given on page 570, pattern No. 8206. This model is pretty for making over a dress, as the skirt could be of one material in solid color with a flowered over-dress. Another very pretty model for thin fabrics is the pattern No. 8200, shown on page 535. Many smart little silk or flowered crepe gowns seen in the shops are made after this model. It would be a pretty style for a graduation dress, made in fine voile. This is to be a fluffy season, with lots of frills, and the Summer dresses show this tendency quite strongly.

All the shops are full of bead necklaces; nothing is too odd or too showy to be worn. Of course they are called tango beads, but they only differ from the beads of former years in being more striking in their colors and combinations. If you have two necklaces with beads of different sizes, and colors that will harmonize, or make a striking contrast, combine the two, stringing the different beads alternately, and you will have a tango necklace. Many of them are finished with odd pendants formed of flat slides or plaques of the same material as the beads, tipped with a silk tassel.

HERE is a recipe for old-fashioned apple sauce that is very rich and savory: Fill a small stone crock with peeled, cored and quartered apples. Pour over them a pint of sugar dissolved in a large cupful of sweet cider and add a stick or two of cinnamon. Cover the crock closely and set in a very moderate oven for five or six hours, or over night. If good tart juicy apples are used the sauce is delicious.

WE have been asked several times to give a recipe for old-fashioned salt-rising bread. The following is a century-old recipe, sent to us with a strong endorsement: At noon, the day before baking, take one-half cupful of cornmeal and pour over it enough sweet milk, boiling hot, to make it the thickness of batter cakes. Keep warm. The next morning pour into a pitcher one pint of boiling water, add one teaspoonful of soda and one of salt. When cold enough so that it will not scald the flour, add enough to make a stiff batter, then add the cup of meal set the day before full of bubbles. Place the pitcher in a kettle of warm water, cover and keep warm. When the batter rises to the top of the pitcher pour it into a bread pan and add one and one-half pints of warm water and flour enough to knead it into loaves. Knead but little harder than for biscuit dough and bake as soon as dough rises to the top of pans. This will make five large loaves.



Mrs. Youngwise—"I'm afraid John's mother's offended. She came over to help with my washing, and it was nearly done. She said I hadn't done it right because I didn't boil my clothes like she and her mother always had, and I said she didn't spin and weave any more like people used to, and then she left in a huff."

Anty Drudge—"She'll get over it when I talk to her and tell her about Fels-Naptha Soap. I'll tell her to blame me because I advised you to use it."

Every year there is some new way to lighten women's work—but never a better nor more sensible one than the Fels-Naptha way.

Fels-Naptha Soap in cool or lukewarm water will do anything that soap and water can do, in half the time it used to take with less than half the bother.

It will get your washing on the line so much earlier, and the clothes will be sweeter, cleaner and whiter than ever before. You don't have to boil them, either.

Better buy it by the box or carton. For all kinds of work every day in the year follow the directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

Hot Beverages.

G. L. asks for recipes for hot beverages. I hope the following will prove helpful, some of which are nourishing, while others merely quench thirst.

An invalid who could not take a cup of hot water as the doctor prescribed found it very palatable when a dash of nutmeg was added. Another family always drinks hot water flavored with ginger for supper. Ginger being an irritant this would not be healthful to use all the time. One mother frequently flavors hot water with cinnamon or cloves instead of tea. A little sassafras tea is palatable and healthful. Peppermint and wintergreen both make very agreeable drinks for most people. Plant mint in the garden and you will have flavor for delicious beverages.

Fruitade can be served piping hot as well as ice cold. Make a syrup of sugar and water and squeeze juice from any kind of fruit, or several kinds; add the juice of a lemon, as this makes the flavor more pronounced. Put an amount of juice according to strength in cup and fill with hot water.

Oatmeal water is one of the most wholesome Summer drinks. To prepare, take a tablespoonful of oatmeal and a quart of water, boil one hour and strain. This is usually served cold, but may be served piping hot. Variation can be made by adding juice of lemon and two tablespoonfuls of sugar to the quart. Vinegar may be substituted for lemon juice.

Rhubarb tea is often relished even by children in the Spring. Cook rhubarb in quantity of water, strain and sweeten with sugar. Serve hot. Barley tea is a nourishing hot beverage. Wash two tablespoonfuls of pearl barley, scald with boiling water and boil 10 minutes, strain, and add two quarts of boiling water and reduce one-half. Sweeten and flavor with lemon juice. The bouillon cubes on the market make a delicious appetizing hot drink.

Caramel tea.—Take two cups of granulated sugar and one cup cream, boil until thick, and dilute with boiling water to consistency of thick syrup and put in can. Place a tablespoonful of mixture in cup and fill with boiling water.

Toast tea.—Toast stale bread and cover with boiling water, let stand a few minutes and strain. When making any beverage remember that a pinch of salt will develop or heighten—make more pronounced—any flavor. M. C. B.

Hand-made Rugs.

My knitted rug, just finished, is very satisfactory as far as looks are concerned, and I hope it will do as good service as my crocheted rug, which has already been in use a year, can be easily washed, and is heavy and firm enough to keep in place easily on the floor. Both have the same soft shaded coloring, the only bright stripe being of shaded old rose to deep crimson, except that the knitted one has a central stripe besides of old blue shaded into gray. The crimson shaded stripe is very easy to manage, as all the shades are done in the same dye in the following way. Crimson for wool is the dye used and pure white wool takes a deep crimson color for the darkest stripe. Underwear part cotton, mostly wool, takes a lighter color. Natural gray wool underwear takes a soft grayish color of the same tone, which shades in between a rose pink which cotton rags take when dipped in this same dye. The crimson stripe in this rug was baby's coat, a white wool one originally, but colored for his use as he began to play about out of doors, and the old blue stripe is all that is left of my wedding dress, which was called cadet blue then; a grayish shade, which has softened more like gray with the 17 years since. There are other stripes in the rugs which have pleasant associations—one pretty one of brown was made of baby John's outworn rompers, and an odd gray stripe was originally work aprons of shepherd check calico. There are some of Daughter's school dresses represented too, and at least one of Father's coats.

The knit one was done in strips with a color scheme as follows: Old blue shaded to gray for the central part of the rug, and an old rose and crimson shaded stripe at either side with shaded brown and black at the ends. A crosswise narrow strip was knitted to hold the rug in shape, but this was knitted of the same color as the stripe opposite and does not show. The coloring is in Roman stripe effect. There are 19 stripes in my rug, each color making one strip. These strips were sewn together with carpet warp, and the finished rug is nearly two yards long by a little more than one yard wide. The black strips on the ends of the rug were each knit longer than the other strips and the cross-knit strip set in to make the right shape.

A friend of mine once knitted a rug large enough nearly to cover the dining room floor. It was not a good idea, as besides being an immense amount of work, it made too thick and heavy a rug, being difficult to keep clean, on account of its weight and size. This sort of rug is only good for medium size, as in fact are also the crocheted ones and the heavy woven ones. I once made the same mistake by having heavy rags, cut twice as wide as ordinary rag carpet rags, woven into a rug large enough for an entire floor covering. It was woven in yard-wide strips and sewed together. It proved too heavy to manage, and finished its days as a curtain in the poultry house, not really as good there as something else would have been, and representing a big waste of time and work and some money. If a large woven rug is desired the rags should be cut as for ordinary rag carpet, narrow as will hold when sewn together.

I have seen two very good ones woven in this way, the center in each case being of hit-or-miss rags and with stripe on each end. One had an artistic border in soft pastel shades—no bright color at all. However, the coloring is largely a matter of individual taste, as we realized when this rug, just from the weaver's was proudly exhibited to two old ladies, near neighbors of ours. One looked at it dubiously and frankly said she thought it "the humbliest thing she ever did see." The other said the colors were well enough, but asked us over to see her carpet. I did go over soon, and the little old Frenchwoman took me proudly into her "best room" and threw up the shades. I don't know when I have seen anything so dazzling as that floor covering with its brilliant hues of brightest purple, orange, green and yellow. I am sure all the rest of the rainbow was there, but these shades were so bright. She assured me that she colored everything in the carpet. I could honestly say that I thought the colors very bright and pretty, but I could not help thinking that the combinations and brilliance and lack of shading left much to be desired. Carefully she drew down the curtains again, and closed the room, which was never used except on solemn occasions such as weddings or funerals.

The crocheted rug was made a square or rectangular shape by adding two extra stitches at the corner after first crocheting a square-cornered piece starting with 50 stitches. These rugs are usually round or oval, as are also the braided rugs.

For knitting the rug, long coarse needles such as sweaters are knitted on, are used. My needles are of celluloid and a bit over a foot in length, very smooth and easy to work with, much better than the ordinary wooden needles. The rags are cut as fine as will hold together easily, just as for weaving rag carpet, and are sewed and wound into balls. The stitch is plain garter stitch. For the crochet rug a large size crochet hook is used and the single crochet makes the firmest rug. Double crochet is sometimes used.

Housecleaning is a good time to pick up and wash all the outworn material which works well into rugs. Often the coloring can be done while other dyeing is under way, so saving time and work, then in the long Winter evenings it is a pleasure to sew and knit or crochet the rags, and when done these rugs are very serviceable and suitable for farm houses. F.

To Clean Saucepans.—White-lined agateware utensils can be easily and quickly cleaned by putting a tablespoonful of chloride of lime in the saucepan and filling with water. Let the water boil. This works like magic. C. C. H. G.

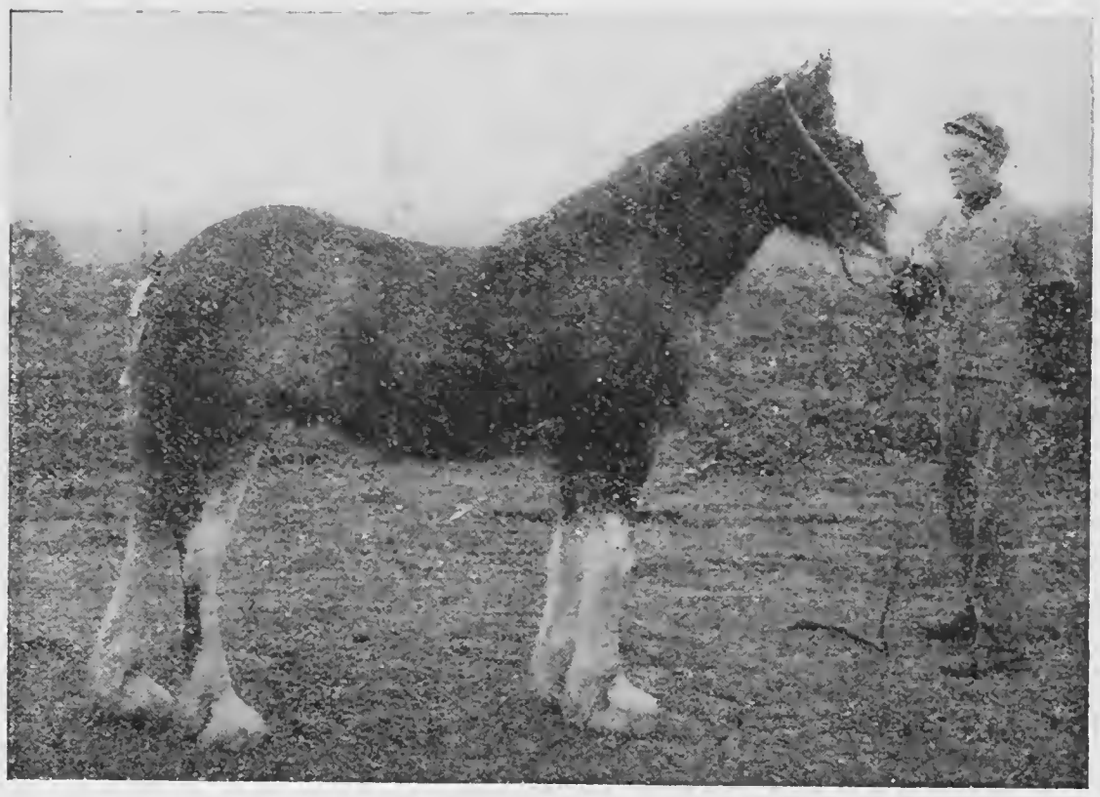
Live Stock and Dairy

A $5,000 CLYDESDALE COLT.

A transaction of special interest to the Eastern live stock breeders was made at Fairholme Farm in New Jersey last week, resulting in the sale of a 10-months-old Clydesdale colt for $5,000. This youngster, known as "Fairholme Footprint," has the distinction, as far as I know, of being the highest priced 10-months-old draft colt that has been sold in this country. Mr. F. Lothrop Ames of Langwater Farms, Massachusetts, is the buyer of this colt. This colt possesses rare individuality, and is backed up by blood lines and breeding that are unsurpassed. His dam, Harveistoun Baroness, was imported by Mr. Robert A. Fairbairn two years ago, after she won highest honors at the Scottish shows. She went direct to the International at Chicago and was awarded the grand championship at the International. She was returned to the farm at New Market, New Jersey, produced and raised "Fairholme Footprint," and was again fitted for the show ring, shipped to Chicago and again won the championship. The sire of "Fairholme Footprint" is Dunure Footprint, who is without doubt the most popular young stallion in Scotland, it being reported that at one of the recent shows in Scotland, 11 out of the 12 winners of the show were sired by this famous stallion. The grandsire of this colt is Baron o' Buchlyvie, and



FAIRHOLME FOOTPRINT, A $5,000 COLT.

he was sold at public auction for $45,500 Harveistoun Baroness was sired by Baron's Pride, undoubtedly the greatest sire that the Clydesdale breed has ever known, it being reported that the value of his immediate offspring is over $300,000, while he is said to have earned $150,000 in stud fees. As an individual "Fairholme Footprint" is without a peer. He combines size with substance, while his feet and legs evidence quality at every point. That he will be a prominent factor in the American show yard there is no doubt, and with such breeding and backing he should prove a remarkably prepotent sire. The sale of a yearling Clydesdale, raised and bred in New Jersey, for the highest price on record, will no doubt open the eyes of those interested in draft horse breeding in the East, as well as the trotting horse enthusiasts who heaped ridicule on Mr. Fairbairn and others, including the Live Stock Commission, when they imported the first draft horses for breeding purposes in New Jersey five years ago. In language more forceful than polite it was asserted that no one could raise draft horses successfully in this part of the country, and that nobody would buy them even though they were produced. The answer is "Fairholme Footprint." This will no doubt be a great impetus to draft horse breeding in the East, and only shows what can be accomplished if care is exercised in the selection of breeding matrons, with due regard for individuality and breeding. It might be added that Mr. Fairbairn refused $5,000 for the dam of this colt on the day that the sale was made, as Mr. Ames left the standing offer of $10,000 for the pair. F. C. MINKLER.

New Jersey Exp. Station.

HOME BUTTER-MAKING.

The question of disposing of the product of the cow to the best advantage has so many sides that it becomes quite a grave question. About 20 years ago a creamery started up about a mile from our place, and we carried our milk to it till it closed its doors, or had them closed. As "Mother" had made the butter before she started again, but as we were keeping more cows and she needed all her strength to do the housework, I decided to try my hand, and with her help did pretty well. A while after the factory started again, and they wanted us to help. I took a certain number of pounds of cream and carried to the factory and then churned a similar amount, and was satisfied that it would pay me to make butter. I tried this a second time with the same result. But, and that is a great big but, if mother or wife had to make the butter with their present health, the cream would go to the factory. We have 60 customers who are glad to pay the highest market price for our butter, and there is hardly a week that we could not get more customers. It takes about six hours a week to deliver our butter, and we make nearly 7,000 pounds a year. We are as well fitted as most creameries to make it, and as I like the work, it is no hardship.

To sum it all up, let me put it thus: Don't put butter-making onto already overworked women. The creamery is a god-send to them. If you don't make butter that brings the highest price you can make more out of the creamery. If you have surplus of women power and they are the kind that delight in making the high grade butter, and you have a market that will pay for quality, what it is worth, go ahead and make it, but it seems to me that it would be a good plan to get the boys on the farm interested in butter making, even to sending them to the agricultural college, at least for a short course. FERNSIDE DAIRY.

Maine.

WORLD'S RECORD FOR A DAIRY COW.—The Guernsey cow May Rilma, owned at the famous Chesterbrook Farm, the home of the late A. J. Cassatt, now owned by his son, Capt. E. B. Cassatt, has given in 365 days, 19,639.50 pounds milk, which contains 1,059.59 pounds butterfat. This cow was bred and raised at the farm, and her year's work has been carefully supervised under the regulations for the Advanced Register of Guernsey cattle conducted by the American Guernsey Cattle Club. While officially supervised by the representatives of the Pennsylvania Agricultural Experiment Station, her work has also been checked by six similar institutions in other States, and by a representative of the Dairy Division of the United States Department of Agriculture. This record surpasses that of any cow of all the dairy breeds in the world. May Rilma is producing more butterfat in her thirteenth month than in her first, thus widening the distance beyond her nearest competitor and more firmly establishing herself as queen of the dairy world.

THE superintendent was examining the school. "Who wrote 'Hamlet'?" he asked. A very frightened little boy rose and said: "Please, sir, I didn't." The superintendent was afterward relating the incident to the members of the schoolboard. "Haw, haw!" guffawed one. "I bet the little rascal did all the time."—The Delineator.

"Dickering" in the Live Stock Business.

"Don't dicker in purebred stock if you have a herd of a high standard, and the goods you buy and sell are the ordinary kind," is the opinion of Will Bullard, Holstein breeder of Ohio. Mr. Bullard says: "I had a chance to make some money. Three head from an ordinary herd of registered stock were offered for sale. The price was attractive, and I could have taken them in my herd, and in a short time nearly doubled my money. I would have sold them not on their merits but on the reputation of my herd. They would not have measured up to the expectations of my buyers, and it would have turned out to be an expensive deal in the end. Besides, it is unethical to sell inferior goods on the reputation of high-class stock.

"A dickerer who has his reputation established as a dealer and trader picked up the stock. He cleaned up several hundred dollars of easy money. The buyer since learned of the margin the dealer placed on the cattle. The buyer cannot blame the breeder for this rake-off which went to the dickerer, and the breeder will in no way suffer from the misrepresentations made to the final buyer. There are some dickerers who are on the level of horse traders. So long as the breeder does not become side-tracked into the dickering game, he will be an asset to the breeding business. There are men in the live stock business who are far above the petty deals. These men have a national reputation, their advertisements appear in the farm papers. Their word is absolutely reliable, and they consign their best stock to the consignment sales. If the breeder deals in stock, let him handle good stock, charge fair margins and give a fair deal, and then advertise his business. Otherwise let the local horse trader have the field without competition." W. J.

Ohio.

New England Milk Producers.

Another prop has been knocked from under the Boston milk contractors by the decision of Judge Morton of the U. S. District Court, at Boston, sustaining the demurrers filed by the defendants something over a year ago, and thus ending a long-drawn-out case. The case in question was started something like three years ago by indicting several Boston contractors and the then secretary of the B. C. M. P. A., Mr. Hunter, claiming a violation of the Sherman Anti-Trust Law. The claim was that these persons acted together in making an agreement as to price to be paid farmers for milk, thus forming a trust, and shutting out free and open competition in sale of this product. Two indictments were brought, one charging conspiracy in restraint of trade, the other charging combination in restraint of trade, and attempting to monopolize trade and commerce in milk. The judge finds in the first count that there was not an unreasonable restraint of trade shown to justify carrying the case further, so this count is dropped. In regard to the second indictment, the facts shown do not prove a crime has been committed, or prove any intention on defendants' part to force down the price paid for milk, or intention of underselling others in open market; or, in other words, the judge did not think the facts shown in either indictment would warrant indictment by a jury trial.

While most people who knew the situation did not think any other decision could be obtained, yet the uncertainty has worked much harm to producers in many ways. It has given the contractors an excuse to refuse to confer or agree on a price to pay for milk with the producers, except in individual cases, and these were confined to a statement that the contractor would pay a certain price for milk the coming month or two, and the average price for the coming six months would probably be so-and-so, subject to condition of market, demand, etc. To pin them down to any solid agreement was impossible in nearly all cases. It also frightened the farmers' organization into disbanding in a manner not very creditable to itself, at a time when it or something along its lines was necessary to the life of the milk production on our New England farms. Only a few months later the secretary of this association since its founding passed away, and many believed his death was hastened from worry over the situation and results, or failure of results, in the cause of the milk producers, to which cause he had given his best efforts, only to be judged unfairly by many who had no cause or right to judge. No doubt Mr. Hunter made some mistakes, but those who knew him best had great faith in him, and many of us know that the best and most honest man in the world, in the same position, would be called a rascal or worse by some of the men he was doing his level best to serve. That is the reward many get who try to help their fellow farmers, and it is so in other walks of life also, but seemingly not to such a great extent. The farmer seems to be naturally suspicious, and more willing to believe bad than good of his neighbors and best friends sometimes. These are sad facts to state, but too often true, and these are the strongest reasons why the farmers' organizations do not get better results.

At the death of the old Producers' Association a new one was formed by a few who had hope and were still willing to carry the battle on. A moderate success has crowned their efforts during the past year, and the first annual meeting, held last January, resulted in little or no friction, as all worked together in a creditable manner, and backed up the policy of the directors in their work the past year. The association also approved the action of its directors in securing the services of Mr. Pattee for secretary at a salary of $1,400 per year. The secretary's duties will be many, the most important of which is organizing the various sections of New England supplying milk to Boston. Another almost as important is maintaining an office in Boston as headquarters of the association, keeping track of and watching over all legislative matters which would affect the producers in any way, and keeping the producers informed of same by a monthly bulletin or otherwise, as seemed necessary; also in boosting and advertising our product to consumers in all ways possible. These various duties will keep him busy, and if he carries them out in an able manner he will certainly earn his money and be a good investment to the organization at this or a greater expense. His work up to date has been largely organizing in New Hampshire, where he is well known and liked. He has, of course, attended to some other matters, as he could, but as he has a big job before him, which takes time and patience, we must not expect perfect results all at once. It takes time to build a strong, stable organization, and while the situation is very bad at present, and prices much too low, if we keep our courage up and work together we regain our lost ground, and will win yet. If everybody helps we will show them that the New England milk producers are not dead, or even sleeping. Our work is to wake them up, and we can do it.

A. E. P.

An old colored woman boarded a street car and proffered the conductor five pennies for her fare. "I can't use them," he said gruffly. "Dat's all right, honey," she replied. "Jes' you give 'em to the company. They kin use 'em.—The Delineator.

"Meridale Jerseys"
1914 edition, describes four distinct families represented at Meridale Farms. The oldest of them is the St. Lambert Matilda family, descended from the foundation stock selected twenty-five years ago for the original Meridale Herd.

One of our best bulls of this breeding is for sale, dropped September 15, 1913; solid fawn in color, with black tongue and switch. Individually, he measures up to a high standard of dairy type.

His sire, Gazelle's Fawn Rioter King 71966, has nine daughters and one son in the Register of Merit. His dam, Meridale Fontaine's Petite 138272, produced 6033 lbs. milk, 412 lbs. butter at 4 years old, and 8910 lbs. milk, 607 lbs. butter the year following, her fat test averaging 5.8% for the 2 years.

Particulars and pedigree, with copy of booklet, mailed on request.

DAIRYING IN CENTRAL NEW YORK.

1. Can an ordinary 30-cow dairy in Central New York be run at a profit on a 200-acre farm by two men, where all grain is purchased and only hay, stalks and pumpkins for a while in the Fall, are fed from the farm, milk selling at an average price of 3¼ cents per quart? 2. If not would increasing the dairy by 20 cows and using milking machines do it? 3. Would the addition of a silo do it? 4. Would the sale of cream, butter, or cheese at wholesale and the use of the by-product for hogs, increase the results, and as a general rule which of the four products is the most profitable? A. R.

Good Butter Pays Best.

1. I do not see why a dairy of 30 cows cannot be run at a profit on a 200-acre farm. Of course it will depend on the cows, how good they are as milk producers, and the man behind them. You speak of ordinary cows. I think there are too many of that kind being used for dairy purposes. I know of plenty of cows in my own neighborhood that are not milking over 4,000 pounds in a year. If a man had to buy all his grain, and depend entirely on hay and stalks, and only get 3½ cents for his milk, I am afraid he would not receive a very large profit from his cows. If he can raise Alfalfa to feed part of the time that would cut down the feed bill one-third any way. 2. I have never had any experience in using a milking machine. 3. I know the silo would help out wonderfully; with good silage to feed night and morning and hay in the middle of the day he would be surprised at the end of the year to see how much more he had made from his cows and at less expense. 4. Now I am coming to the part I take in the dairy business. I have 15 Jersey cows, mostly grades, and they make me 300 pounds of butter on an average per cow in a year. This butter sells at an average price of 36 cents per pound. Of course I have private customers that I furnish, and I could sell double the amount if I could make it. Many are making more butter per cow than I am, but this is better than 3½-cent milk, and I have the skim-milk, which is surely worth $10 per cow, to feed to pigs. With a little grain it does not take a great while to make a pig dress 100 pounds, which in our market is worth $12. I also sell a number of veal calves,
New York. CHAS. LEHMAN.

Not a Living Wage In It.

1. With good care and management the average cow would not give more than 2,300 quarts and by my experience the expenses would be about as follows:

To 2,300 qts. x 3¼ x 30 equals		$2,242.50
To 30 calves at $2		60.00
		$2,302.50
For grain at $27 per cow	$810	
For seeds	75	
For repairs	60	
For expense 4 horses	230	
For interest on $10,000 farm val.	500	
For interest and depreciation on tools and machinery of $800 val.	128	
For interest on stock	180	$1,983.00
Profit		$319.50

2. Adding 20 head to above dairy would bring at same rates $1,495, with an added expense of about $895, leaving a profit on the 50 head of $919.50.

3. By my experience the addition of a silo with a good quality of silage would add 10% to above profit.

4. This is a hard question to answer, as much depends upon the breed, butterfat in milk, local conditions, etc. Taking it for granted that the milk would test 4% and the average price 32 cents per pound for butterfat, each cow would produce 197.72 pounds, selling for $63.17 and allowing 20 cents per cwt. for skim-milk would bring gross receipts up to $72.97 per cow, as against $74.75 by selling whole milk, and there is a question of the skim-milk making $9.80 worth of pork, as I have had as little as $1.17, and the most I ever had was $8.85 per hog that I could credit to skim-milk, but I have no data as to amount of milk fed per pig. On the other hand I have fed skim-milk to veal calves and it has paid as high as 39 cents per cwt. Judging by neighbors' experience cheese would pay still less, and if cream was sold at market price per pound of fat there would be nothing gained in that direction, only less labor. E. P. ADAMS.
Chautauqua Co., N. Y.

Prefers to Make Cheese.

1. I think yes, if the farm is properly taken care of and has no boarder cows or boarder men; that is, the men must work and expect to raise crops enough for their teams and families' board and some to spare. There must be but very little forest land; the 200 acres must be nearly all cleared. By these questions it would seem that there was doubt of a 200-acre farm keeping 30 cows and paying labor. It would be doubtful on some farms with some men.

2. No I think 30 cows are more than the average 200-acre farm ought to keep.

3. Would the addition of a silo do it? I think it would have to be an extra farm of 200 acres to keep 50 cows even with a silo, and allowing no waste land, which nearly every farm has.

4. I think the sale of cream, butter, or cheese with hogs would increase the results. You ask which of the four products? I think there would be only three, as the hogs must necessarily be connected with one of the products, cream, butter, or cheese. I would expect every farm to have an orchard that would be made to help, and every farm usually has wood which would be quite an item. The calves from 30 cows ought to bring $3.50 at four weeks old. The men must have a chance to save these calves and not throw away, so as to sell the milk at 3¼ cents per quart. These questions do not take in consideration that there are many things on farm that will help, and not depend wholly on cows. It depends very much on the men, as some men can get so much better results from same cows than others, and not require as much feed to do it. I think cheese would be the most profitable. E. A. BENTLEY.
Allegany Co., N. Y.

Prefers Making Milk.

1. This question as put is not very clear. How far is this farm situated from a shipping station? Is this 200-acre farm all tillable land? What is the condition of the soil as to ease of tillage and fertility? Is it well fenced and watered? Are the buildings comfortable for housing 30 cows through the Winter season? Assuming a favorable answer to all these questions, it would still seem a hard task for two men to undertake the production of milk at a gross price of 3¼ cents per quart and have to buy all grains fed. If these men have capital sufficient to buy grains in car lots for cash it would help out some, still dairymen about here claim milk cannot be produced at a profit for less than 3½ cents per quart. However, labor conditions may be different in Central New York and such a business venture as this might pay a small profit.

2. I have not had experience with milking machines. Dairymen in general seem slow in adopting them.

3. Silos are one of the essentials in the profitable production of milk. A silo of 32 feet stave and 16 feet diameter ought to furnish sufficient silage for 30 cows during the Winter season; 12 to 15 acres of corn should fill it.

4. No, not with an ordinary herd of dairy cows. The four products of the dairy mentioned, in the order of their quick net profit returns would be, I think, milk, cream, cheese, butter.
Monroe Co., N. Y. J. E. BEEDLE.

Must Be a Mighty Worker.

1. I enclose these figures, nearly all from my experience, in answer to your first question. The farmer must be strong, a good manager and a hard worker to bring about this result.

2. To increase the dairy by 20 cows would make a much greater expense for help; have seen milking machines work, but am not convinced they are practical. There is a difference between farming with money and farming to make money. The low prices of milk, 2¾ cents, and the high price of feed and also of cows, make farmers free sellers; the production will grow less each year. Low prices with arbitrary rules will cause them to change to other lines.

3. We do not use silo; hay grows three tons to the acre; that will do for us. We raise young stock, sell cows and large quantities of hay, with many side lines to help out. Farmers can get along without making so much milk as formerly.

4. Where is the farmer who wants to go back to the old plan of butter and cheese making? It cannot be made up at home. Look out for a milk quake in five years.

Here are my figures:

200-acre farm at $40		$8,000
30 cows at $75 each		2,250
Value of horses		500
Farm tools, wagons and sleighs		400
		$11,150
Cows 6,000 lbs., 2,800 qts., at 3¼c, $91 each.		
30 cows at $91	$2,730	
Growth on young stock	200	
Depreciation on stock		$200.00
Annual loss on stock, accident and otherwise		150.00
Expense for feed		1,200.00
One man at $30, for one year		360.00
One man, extras milk 730 qts, 3¼c		23.72
Rent, value of house and garden		84.00
One man, potatoes, 25 bu. at 60c		15.00
One man, apples		12.00
One man, pears		2.00
Extra help		50.00
Blacksmith bills		30.00
Int. on investment at 4%		446.00
Expense for repairs, buildings and fences		200.00
60 tons of hay at $10	600	
Value of hay fed out		600.00
Family expenses		300.00
School tax		20.00
State and county tax		50.00
Poultry well managed.	150	
Beef for family use	45	
Two pigs well fattened	50	
Expense for reseeding		25.00
Incidental expenses		40.00
	$3,775.00	$3,807.72
Loss of expense	32.72	
	$3,807.72	
Value of labor to farmer and family lost.	500.00	

W. S. PECK.

You need a new

DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or setting process of creaming—

BECAUSE YOUR COWS HAVE likely freshened now and your supply of milk is greater.

BECAUSE YOUR SPRING WORK requires every minute of your time and a good cream separator will be a great time and labor saver.

BECAUSE YOUR YOUNG CALVES will thrive best with warm, sweet separator skim-milk.

BECAUSE WITH YOUR INcreased milk flow your greater waste of cream, without a good cream separator, must run into more money than you can afford to lose.

2nd If you have a very old De Laval or an inferior separator whether new or old—

BECAUSE THE LOSSES OF THE poor separator from incomplete skimming, and the tainted product of the hard-to-clean and unsanitary separator mean most when your volume of milk is the greatest.

BECAUSE OF THE AMPLE AND "more than advertised" capacity of the De Laval, you can separate more quickly and save time, when time means most to you.

BECAUSE AN IMPROVED DE Laval Cream Separator is so much simpler and more easily handled and cared for than any other, and you can't afford to waste time these busy days fussing with an inferior or half worn-out machine.

BECAUSE THE DE LAVAL SEPArator of today is just as superior to other separators as other separators are to gravity setting.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval Agency simply write the nearest main office, as below.

The De Laval Separator Co., 165 Broadway, New York, 29 E. Madison St., Chicago

The Well Platform Everlasting

Ask the Alpha Dealer

Protect Your Health With ALPHA Cement

A concrete platform over your well, and a concrete casing in it, shut off the germ-laden surface water and safeguard your family with little trouble and slight expense.

Wood rots quickly; it is slippery, leaky, unsafe. Concrete, made of the right cement, is imperishable. Four sacks (1 barrel) of cement, mixed with sand and gravel, make a permanent concrete platform, 6 feet square, 5 inches thick, if you use

ALPHA THE GUARANTEED PORTLAND CEMENT

Its greater binding power makes ALPHA more economical than a cheaper cement. Every ounce is powerful, because it is mixed right, burned right, ground right and properly aged before being shipped. ALPHA is *guaranteed* to be stronger than the Government standard. Don't buy merely a "Portland" cement. Insist on ALPHA and be *sure*. If your dealer doesn't sell ALPHA, let us tell you where to get it.

112-Page Concrete Book—FREE

Our book "Concrete in the Country," shows 100 ways to improve your farm with ALPHA—how to make well-platforms, walks, stable floors, manure pits, etc. Regularly 25 cents. Sent free. Use the coupon or mention this publication.

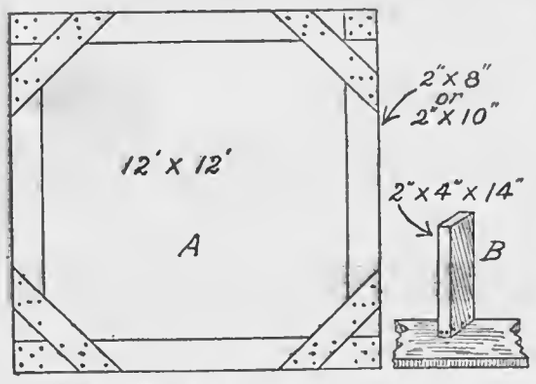
SQUARE SILO.

I would like to know more about the square silo mentioned in a recent number, what mistakes is one likely to make?
New York. C. D.

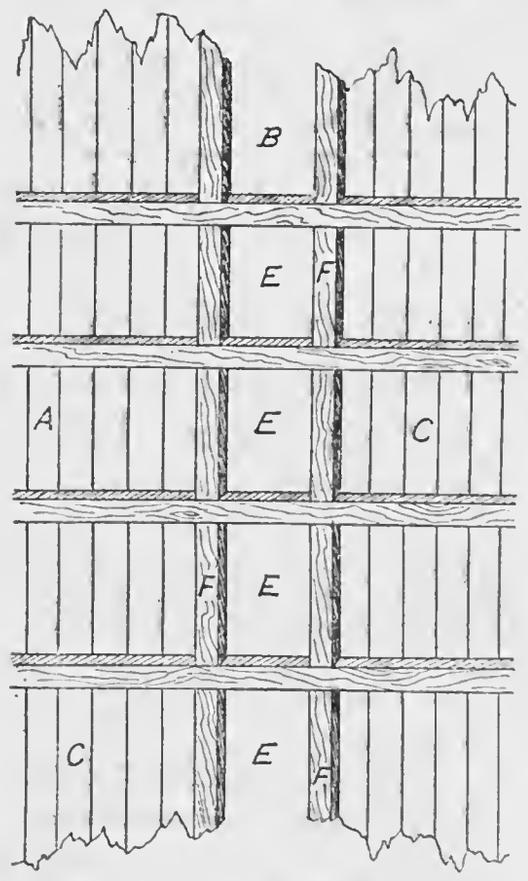
There are no mistakes to avoid if one uses good material, and good workmanship in constructing. They are built in plan exactly as they were 20 years ago, the only special difference being the extent of the elaboration the man may indulge in. One near me recently built cost something like $600, and holds no more, nor does it keep its silage any better than a more modest one nearby, that cost about a third as much. We here present another diagram of the girths made ready to go into the erection of the silo. If it is desired that the silo shall be 12x12 feet inside measurement, the girths should be 13 feet long and this proportion would hold good in any sized silo.

Put these hard wood girths down to make a perfect square and spike at the



GROUND PLAN OF SQUARE SILO.

ends so to make true angles. After spiking, cut a corner length, and spike it across the angle, placing this cross-piece far enough in to cut off six inches of the sharp corner angle, of the girths. Make the foundation for the silo out of stone cement, brought up high enough above the surface so that it will be protected from surface water. Make this platform two feet larger all around, than the size of the building. Make the first girth double, spiking two of the 2x8 together. Bed it into fresh cement, and bank up a little with it before it sets. Now cut 12 pieces of 2x4, into 14 inch lengths, and toenail them onto the girths, four feet apart, set flush with the inside edge



SIDE OF SILO SHOWING DOORS.

of the girths. Have another frame made and lay it onto these spacers, and spike down through to these spacers, being sure that the girths are plumb to keep the inside walls a true perpendicular. Put on another row of spacers the same way, and so on up 12 feet, when they can be cut a little longer, until at the top you, for the last, can use 30 inch spacer. True up the frame with braces, and go to laying the siding for the inside face of the silo. Use three inch wide lining, splice on the girths, drive up snug, and keep on round until within 20 inches from where you started.

As you proceed with the erecting of the frame, you will soon discover that the girths can be put in place, and spiked together on the frame quite as well as to first make them on the ground, and hoist them entire. Get the door space plumb and of equal width all the way up and cut in 2x4s between girths for door jambs, setting each in an inch, so to make the doorway 18 inches. Make as many short doors as spaces. Center each in the center of a girth, of course fitting them in on the inside, so the pressure of the silage holds them in place. Cover the outside of the silo with any kind of siding you choose. Good roofing paper put on up and down, answers all right if not molested. Put on any good roof. A roof affords no protection to the silage, more than to keep out snow. With us, the silo is placed against the side of the dairy barn, and "tied" to it to make it secure against the winds. If the silo were to be made more than 12 feet square, better use 2x10-inch girths. In many silos the corner tie that does away with the angle, is made of a 2x12 and is concaved so that the corner is very nearly a circle, and avoids trouble in turning when putting in the siding. In the cut below, A is outside of silo; B doorway; C inside lining; E doors; F 4x4 cut in between girths.
JOHN GOULD.

Silo for Three Cows.

I have just read the answer to A. B. C., New Jersey, page 539, and do not agree that it takes 10 to 12 cows before it is economical to build a silo. My father has had one for 10 years and has not had over three cows in this time, and mostly two, but he also fed some silage to horses. He had only two and three horses. When I went to farming I also erected a silo for three cows, and would not think of doing without. Both silos are made practically the same, only mine is 7½x24 feet, while my father's is 8x30 feet. They are round, made by sawing elm ⅜x3 inches and making five thickness forming hoops, spaced two feet at bottom to three feet at top, and sheathed with 1x4 yellow pine. I made mine all alone, except raising, which was done with a traction engine the day of silo filling, except about 30 minutes while the mistress of the house helped to space the hoops. V. D. M.
Ohio.

Imitation Silage.

We have a small silo 8x20 feet on the place, but intend to keep but one or two cows. Of course it is impractical to fill a silo for one or two cows, but I hate to see the silo empty. How would it work to grow, say sweet corn and cure it in the shock, then when thoroughly cured cut and put into the silo? Would it be liable to heat or undergo decomposition? We have a number of horses that well-cured fodder might be fed to, but am afraid of silage as it spoils faster than we could use it, but thought perhaps by putting the well-cured fodder in the silo this difficulty might be overcome.
Connecticut. R. C. B.

R. N.-Y.—We doubt this plan of cutting dry sweet corn stalks into the silo for two cows. Our plan would be to grow a good variety of flint corn for grain. The stalks will make good feed for all the stock. For the cows, if you want an "imitation silage" you can cut these stalks into a hogshead or vat and pour over hot water, cover and let them steam. Add a small quantity of waste molasses and you will have a "fair silage." By cutting in this way frequently there will be much less loss than if you cut the silo full.

VENEZUELA SILOS.—There is a demand for silos in Venezuela. At the present time it is said that there is not a single silo in that republic. At the present time there has been no rain for four months in Venezuela, and there will be two months more of drought. This means heavy loss from live stock. During the rainy season there will be a tremendous growth of green fodder, and a good silo properly handled would carry it over and prove even more useful than it is in this country.

"MR. Brown's started his garden. I saw him planting his seeds this morning." "That reminds me. It's time I turned the chickens loose."—Detroit Free Press.

TEACHER: "Tommy, what is a boomerang?" Tommy: "I can't describe it exactly, but I know it has a short tail and can climb trees."—Birmingham Age-Herald.

"FATHER, you took a science degree at college, didn't you?" "Yes, my boy; I spent two years on science." "When you look in a mirror the left side of your face appears to be the right side, and the right side seems to be the left. The looking-glass reverses it, doesn't it?" "Yes, my lad." "Then, why, papa, doesn't it reverse the top and bottom of your face in the same way?"—Melbourne Australasian.

Crazy About His
SHARPLES MILKER

THAT is the way in which one user of the SHARPLES MILKER (name on request) expresses his enthusiasm. This man's letter of endorsement was purely voluntary and was sent to a man in no way affiliated with The Sharples Company in answer to his request for a frank statement as to just what the SHARPLES MILKER would and would not do. The full text of his letter follows:

"In reply to your inquiry regarding my milking machine, will say I have used the SHARPLES MILKER several months and find it real practical. In fact, I would not do without it for the price of two.

"In my opinion, it produces more milk than the ordinary hand milker. My cows are not one breed—just select, good milkers. At present I have 21 head. Their quarters are in better condition than they ever were when the cows were milked by hand.

"I will conscientiously recommend the SHARPLES MILKER to anyone needing a machine. If you have as many as 10 cows you should have a milker. My SHARPLES has not failed a milking so far. *I am crazy about the machine and love to talk about it.*"

We quote this unsolicited testimonial to the high qualities of the SHARPLES MILKER believing you dairy farmers appreciate the full significance of such a statement by one whose dairying interests are identical with your own.

TWO SIDES OF THE DOG.

"Dog Haters and Dog Lovers."

THE R. N.-Y. is certainly a success as an "Artful Dodger" on the dog question. I suppose the distiller and the saloonkeeper might speak on the liquor question as you do on the dog. "There seems to be no way of reconciling the liquor lovers and the liquor haters and bringing them into any fair compromise. It is a fight to the death on the part of the liquor haters, and a defensive fight on the part of the liquor lovers. We should say that the latter are gaining ground, as liquor is made more carefully and the business has been brought under greater system."

If the whiskey men said any such thing, would you consider they had made any sort of reply, or in any sense closed the discussion? Yet they would have been stating facts as you did in similar remarks on the dog. I deny too that I at least am a dog hater. I do not hate dogs; in fact I would like to keep one, did I not believe by so doing I would be setting a bad example and encouraging a practice I think at once a source of danger and financial loss. I "hate," if you please, the dog habit. If you as a dog lover believe in the practice, why not say so and explain why you recommend, by indirection at least, the keeping of dogs by farmers? Tell us why there is any offset to the loss of millions annually in sheep killed by dogs—where there is any to the danger to human life and safety? What can you set against the death by hydrophobia of at least one human being every week on the average in the United States? What pays for the practical abandonment of sheep growing in all States east of the Mississippi because of the menace to flocks by dogs?

I am ready to admit and even to maintain there are some dogs which return a profit to their owners, and there are also many others which while not financially profitable are yet so faithful and good in temper as to make "their company equivalent to their board." It is the average I am discussing, and we all know there are few dogs that will not worry sheep if they have a chance. The facts are that sheep cannot be kept on account of dogs, and if THE R. N.-Y. thinks that a desirable state of affairs for the country in general and farmers in particular please tell us why.

Those "dog lovers" who believe their chickens and other goods safe because they own dogs would do well to read accounts of the raids of robbers on some of the houses of wealthy suburbanites on Long Island, which took place in February. The thieves stole, not only what they could find loose but took some 25 dogs, fancy Airedales, Boston terriers, English bulls, etc. Enough said as to the "protection" afforded by ugly dogs.

I think THE R. N.-Y. the best paper of its class in America, and one of the best of any class, but no human institution is perfect, and I think I detect a little bias here on the dog question. I admit I am biased, and think I have reasons to be. W. A. LANDERS.

New York.

He Saved My Life.

I wish you would print the experience I had with a dog. I am the owner of an Airedale, which my father brought home last March, and I would not part with him for anything. I went out eeling in my boat last April 27, and took along my shotgun and my faithful friend the Airedale. When I was about a mile and a half from the shore I wanted to anchor my boat and start eeling, when my gnn which was lying on the sternsheet, accidentally discharged and shattered my left leg so badly that it was impossbile for me to walk. I managed to get the boat to the shore, but could not walk from the shore to the house which was almost half a mile from where I landed my boat. I yelled, but all in vain. I would have bled to death had not my dog barked and run to the house and jumped against my father when he came out to look what the dog was barking for, and after jumping up at him he started back to where I was and back to the house until he drew my father's attention towards me. We only had the dog about a month before it happened.

I fully agree that the Airedale is a most faithful and useful dog. I am also glad to hear that all people are not dog haters. I think that every home should have a dog. He will protect the property as well as the majority of watchmen. How many criminals have been located by the police with the aid of a dog which otherwise would still be free from jail? How many rats, mink, weasels and other chicken thieves have been caught and destroyed by the dog? If it wasn't for the dogs that clear away this vermin I think a good many of the people would have to sit up all night with a shotgun at their shohulder. There would be considerably more poultry, stock and vegetables stolen from the country people if it wasn't for our faithful friend, the dog. As we have very poor police protection in most country places we are thankful to have a dog. E. F. S.

Staten Island.

Where Dogs Pay.

Like others the above subject has more than one side. I am well aware that only a very few farmers make their canine stock pay them anything, but that is partly the farmer's fault. Here on our farm our pair of collies pay all the farm taxes and the interest on the mortgage besides. In addition to that they are always willing to put the chickens out of the front yard, help drive the other farm stock or do anything else that a farm dog should do. They have saved our poultry from two and four-legged "varmints" several times. There is such a demand for pups that we expect soon to increase our "best paying farm stock." Don't despise the *well bred* farm dog till you stop and think a bit about what he will earn you if given the chance. A Prussian who lives not far away and who raises prize Duroc Jersey hogs and collies, says that he can make more out of a female collie in a year than he can out of one of his fine sows. J. H. TUBBS.

Nebraska.

THE UNDERGROUND SILO.

I should be glad to know if any of the readers of THE R. N.-Y. have ever tried an underground silo, or if there is any valid objection to them? Silos are almost unknown in this Province yet, and I should imagine an outside silo would be liable to freeze in this climate. The conditions here are ideal for the construction of underground concrete silos. Excavation can be made to any depth with no danger of caving, and water would rarely give any trouble. J. H.

Whitewater, Manitoba.

We have had some little discussion of these pit or underground silos. The conclusion seems to be that they prove satisfactory on dry, well-drained or sandy land, but they are not satisfactory on wet land where the water level is high. They are dug out something like a well, preferably square, and are lined on the inside with brick, stone, or cement, or in some case they are built like an underground icehouse with two walls, and air space between. The corn is cut in the same as for any other silo, and packed down solidly. Most of them are built two feet or more above ground, and a little house or shelter is built over them. The Nebraska Experiment Station at Lincoln has printed a little pamphlet describing these silos, which you might well study. In some parts of the West where the soil is naturally dry, the cost of building material is high, and the winds cold and strong, these pit silos are very satisfactory.

EXPERIMENTS WITH PIGS.—Farmers who are interested in fattening hogs should read Bulletin No. 175 of the Kentucky Experiment Station at Lexington. This gives the results of various experiments in growing and fattening hogs, both in the dry lot and also upon forage crops. While, of course, the methods employed are in a way peculiar to the South Central West, still any farmer, and particularly those who wish to keep hogs at pasture, can learn much from this bulletin. The notes on feeding the sow while she is nursing her pigs are very good. Among other things we are told of the following remedy or treatment for pigs that are infected with worms. The following mixture is a dose for a 100-pound pig: Santonin, 2½ grains; areca nut, one dram; calomel, one grain; sodium bicarbonate, one dram. Pigs are starved for 12 hours previous to giving the remedy, the medicine being thoroughly stirred in a small amount of ground feed, and repeated in 10 days.

Molassine Meal

MADE IN ENGLAND

IS NOT AN EXCUSE FOR SELLING RAW MOLASSES.

It is a scientific feed, made under a patent formula never successfully copied. Twenty years of public approval warrants your faith in Molassine Meal.

You need have no fear about the keeping qualities of Molassine Meal—*it has no "expiring date" when it ceases to be good*—it *always* gives satisfaction.

Nothing Will Take Its Place

For years it has watched imitators come and go, but today Molassine Meal is the *one and only feed* of its kind that *will produce the results* your stock need.

***Insist on having Molassine Meal*, for your cows, horses, sheep, pigs and poultry.**

If your regular grain dealer will not supply you, write us.

JOHN DEERE TWO WAY PLOW

The Sulky with the Steel Frame and Patent Auto Foot Frame Shift

The John Deere Two-Way Plow will work equally well on hillsides and level land. It is well balanced, easy to operate, light draft and efficient,—built in the East for Eastern conditions.

It is the only two-way plow that has the Patent Auto Foot Frame Shift, which insures accurate and uniform width of cut. It will do the highest grade work for the longest time with the least possible effort and expense.

These Are Some of the Reasons:

1. **All Steel and Malleable Frame—Steel Arch:** Light, Strong and Durable—Rigid Connections—Permanent Alignments.
2. **Patent Auto Foot Frame Shift:** Slight foot pressure swings frame and accurately locates plow bottom.
3. **Long Malleable Beam Clamps:** No collars or set screws. Beam bolted rigidly to bracket, which extends to each bail arm. Cut always uniform.
4. **Automatic Shifting Hitch:** Positive and Automatic. Clevis cannot fail to move to position.
5. **Automatic Horse Lift:** Operator's foot releases latch. Pull of team raises bottom. Hand lever also provided.
6. **Adjustable Jointers:** Jointers clamped to beam. May be set forward or back or tipped at varying angles.
7. **Wide Tread:** Prevents tipping on hillsides and permits use of wide or narrow bottoms.
8. **Chilled, Full Steel and Combination Bottoms:** All styles made expressly for Eastern conditions.
9. **Removable Shin Piece:** Insures keen cutting edge—easily renewed—prolongs life of moldboard.

JOHN DEERE, MOLINE, ILLINOIS

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Feeding Young Bull.

I have an Angus bull about 18 months old; he weighs about 800 pounds. I think he should weigh 1,000 pounds at this age. He has always been dainty about his feed. He had a well-balanced ration until about a year old. Since then he has had corn fodder only, as roughage, and for grain, all the cornmeal and oilmeal he wanted, which never exceeded four pounds of corn or three of oilmeal per day. What can I do to grow him? He appears to be well. H. D. B.

Though this bull seems well he is a dainty feeder, and weighs only 800 pounds, when he should weigh 1,000 or 1,200 pounds, showing that all is not right with him. Have him tested for tuberculosis, or if you prefer, get rid of him and start with one that eats well and makes good use of what he eats. Dainty feeders though often showing some thrift are seldom profitable, are always an aggravation, and in the case of breeding stock the defect may be inherited and crop out in the calves. However, stock tonics, medicated salts molasses, salt or a change to clover or Alfalfa hay or pasture may be tried, but I find that when stock won't eat they won't, and that is all there is to it in most cases. W. E. D.

Ration for Sheep; Knee-Sprung Horse.

1. I have a flock of 30 sheep. I am feeding them at present one part oats to two of bran, also turnips and all the hay they will eat. Is this a well-balanced ration? The ewes will lamb about the first of April. 2. I have a horse that is knee-sprung. What could I do to help him? F. O.

1. The grain ration which you are feeding your sheep ought to be about right to keep them in good condition before lambing. After the lambs come you will, of course, have to feed more heavily of both grain and roots. The growth of the lambs depend largely on their getting a good start in the first few weeks. Some corn can also be used in the ration after the lambs are born.

2. In regard to your horse, there is little that you can do to remedy his complaint. Care should be taken that he is not over-driven or subjected to any strain which will make the trouble worse.

Summer Dairy Ration.

I would like your advice on the following ration and how you would improve it. I have six Jersey cows, and try to have one fresh every two months of the year. I am feeding for grain a mixture of 100 pounds cornmeal, 100 pounds bran, 100 pounds gluten and 100 pounds oatmeal, one pound to about every four pounds of milk to each cow, with a few roots every morning; cornstalks, mixed hay two-thirds clover and one-third Timothy, for the roughage. I make my own butter for private customers. I would like to have a ration for Summer, when pasture is short. I always feed some grain the year around. H. F. S.

The addition of 100 pounds of linseed oil meal or cottonseed meal will improve your ration, as it is rather low in protein. The cottonseed meal should be avoided with cows soon to freshen, and for a week after freshening. A good Summer ration would be equal parts by weight, dried brewers' grains, cottonseed or oil meal and cornmeal, or one part each of cornmeal and bran and two of cottonseed or oil meal. C. L. M.

Gluten Meal.

I frequently see gluten meal mentioned in feed formulas for poultry, but judge that it is not in common use, because it is not carried in stock by dealers in this city, and they seem to know little if any more than I do concerning its manufacture. What is the raw material?
Winona, Minn. A. B. Q.

Gluten meal and gluten feed are trade names applied to by-products from the manufacture of cornstarch and glucose. Gluten meal is that portion of the corn kernel which remains after the removal of the greater part of the starch and the germ, as well as the outer covering known as the bran. When this bran is left in the feed, it is known as gluten feed. This product contains a much smaller proportion of crude protein than the gluten meal, but it is the product which is most generally used. It is a valuable dairy and poultry food, ranking with malt sprouts, brewers' dried grains, and buckwheat middlings as a carrier of protein. Gluten meal is higher in protein content, ranking with linseed oil meal in this respect. The retail price of gluten feed in my market, just now, is $1.55 per hundred. M. B. D.

Pumpkins or Mangels For Pigs.

Are pumpkins equal to mangels as part of a Winter ration for growing pigs two to six months old? We like the beets, but think we can grow the pumpkins cheaper, ton for ton. W. C. W.
New Canaan, Conn.

There is very little actual difference in the composition of the field pumpkin when comparison is made with mangels as the following analysis shows:

	Water	Ash	Carbohydrates: Crude Protein	Fiber	N. free extract	Fat
Field Pumpkin	90.9	0.5	1.3	1.7	5.2	0.4
Mangel	90.9	1.1	1.4	0.9	5.5	0.2

However, both of these products should be fed largely as an appetizer, and not primarily as a source of food. It is a fact, however, that where pumpkins are fed in large quantities to swine the seeds stimulate unduly the excretions of the kidneys, and thus prevent vigorous growth and activity. Definite information regarding this somewhat traditional effect is lacking as far as actual comparison is concerned, but there is no doubt but that growing pigs should not be fed large quantities of pumpkin seeds.

On the other hand mangel-wurzels are not only more palatable but certainly more easily stored, and more easily fed, and there is no evil effect from even heavy feeding of mangels, although this is not recommended. It seems to me that the question of succulence for pigs during the Winter months is somewhat exaggerated, and the use of Alfalfa or clover hay certainly is equally as useful and much easier to feed, and it gives the same effect as far as laxativeness is concerned, and in addition supplies sufficient bulk. If I were choosing, however, between pumpkins anl mangel-wurzels, I am sure that I would take the mangels. On the other hand if I had access to second or third cutting of Alfalfa, nicely cured with all the leaves retained, I would prefer the use of such hay in a ration for brood sows or growing youngsters. It is easier to pulp the beets and mix them with the feed than is the case with pumpkins. On the other hand it is suggested that pumpkin seeds are most excellent as a vermifuge, and are useful in limited quantities for use in eliminating intestinal worms or parasites, that infest the intestinal organs of the pigs. Oftentimes pigs thrive more vigorously after they have been fed limited amounts of pumpkins, and it would seem reasonable to believe that the immediate cause is the fact that the parasites have been eliminated, and the animal thus enabled to make better use of the food consumed, rather than the fact that the pumpkins themselves supply the food nutrients. Pigs require more concentrated food than is found in the field pumpkin, and they should be used as an appetizer and vermifuge, rather than the chief source of food. I would advise W. C. W. to cling to mangel-wurzels in preference to pumpkins.

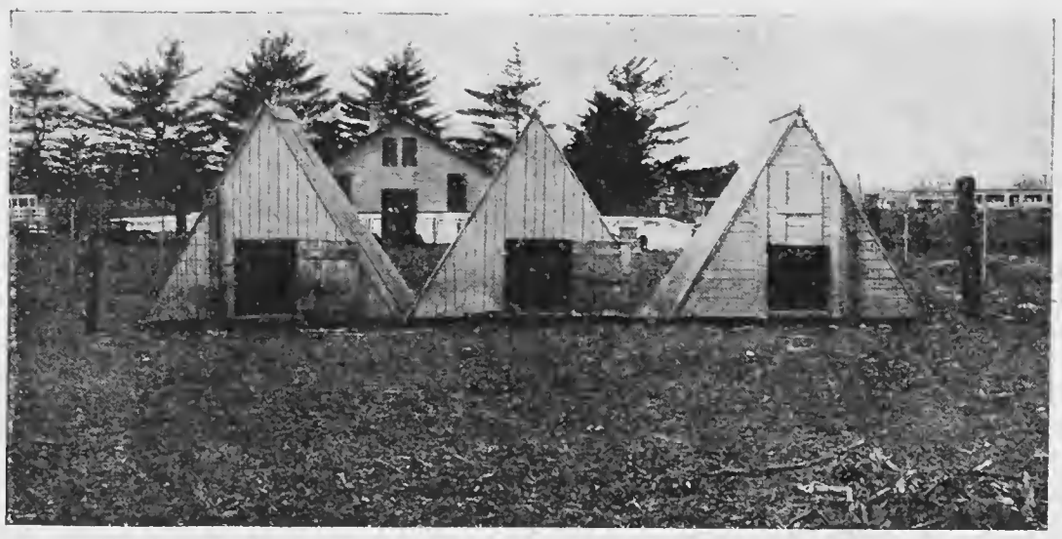
PORK PRODUCTION FOR THE EAST.

How to Make Hogs Pay.

PART II.

CARE OF THE BROOD SOW.—Clean sanitary quarters must be furnished both before and after farrowing if it is desired to develop strong vigorous pigs. The chubby brood sow that is confined to a small pen, and not given regular outdoor exercise, seldom farrows a satisfactory litter of pigs. The colon house is perhaps the most satisfactory means of housing brood sows during the Winter months and at farrowing time, and if suitable yards are at hand, the houses can be grouped together at the far end of the field, covered with straw or corn fodder, and will provide very comfortable and healthy quarters throughout the Winter months. Our experience during the past two years suggests that equal parts of corn and Alfalfa hay, the latter fed in racks, and the former fed on the ear, is without doubt the most economical and desirable ration for brood sows during this period of the year. It is not only an economical ration, but both products are home-grown and by means of this feed combination the caretaker is able to satisfy the appetites of his charges without overfeeding or fattening. Careful records should be kept at mating time, such as will enable the herdsman to isolate the sows a week before farrowing time. Here again the colony house proves its worth. By this means of separation the sow is not annoyed by squealing youngsters or noisy feeders in adjoining pens, and is less liable to injure the small pigs. If left alone she is more apt to raise all the pigs she farrows, a very important item.



COLONY HOUSES FOR BROOD SOWS.

CHOOSING THE MALE.—The most exacting care should be exercised in choosing the herd boar. He is by far the most important and influencing animal in the herd, for indirectly he stamps every pig farrowed. Upon his potency and ability to perpetuate fixed characteristics depends the number and type of pigs produced. He should be purebred and registered, and belong to the same breed as the sows. He must possess those qualities desired in his pigs, for like begets like. He must be masculine, resolute and vigorous. Exercise is of prime importance, for many males are absolutely ruined as breeders by close confinement and heavy feeding. It has been demonstrated time and again that small weak litters are the result of inactivity on the part of the male previous to mating. He should have outdoor exercise every day, preferably in an open yard adjacent to the brood sows. Mature boars should be used whenever possible, as their services usually result in stronger, larger and more uniform litters. The use of the breeding crate makes it possible to mate young gilts with heavy males without injury. Coarse-headed, heavy-shouldered, narrow-backed, deep-rumped males with long coarse legs, shallow bodies and slim hams, should never be used for service. The pigs sired are bound to show like habits of growth and undesirable conformation. Quality, finish, and evident breeding must stand out preeminently.

AGE TO BREED.—Well-grown gilts may be bred when nine months old, but in the absence of size and vigor, delay is necessary. The period of gestation is 16 weeks, or 114 days. Two litters per year may be obtained from aged sows, preferably in March and September, or April and October provided suitable farrowing quarters and good care can be furnished. Otherwise May or June pigs can best take care of themselves. Brood sows or gilts must not be fat or fleshy at mating season or at any other time, unless intended for slaughter. Small weak litters and uneasy mothers result from such practice. Breeding animals of every class thrive better and are more

READY FOR WINTER COVERING OF FODDER.

A quick test for your dairy salt

STIR up a tablespoonful of Worcester Salt in half a glass of water. Do the same with ordinary salt, in another glass. Note the difference.

Worcester Salt quickly dissolves to a clean, sparkling brine and tastes genuinely salty. Ordinary salt stays cloudy — "scummy" — and has a bitter after-taste.

Take no chances with the flavor of your butter. Use nothing but Worcester Salt. It brings out the finest flavor of your butter instead of killing it.

Prize butter makers use Worcester Salt. They can tell you why.

WORCESTER SALT

The Salt with the Savor

A practical dairyman has written our booklet—"Buttermaking on the Farm." Send us your dealer's name and address and we will mail you a copy free of charge.

For farm and dairy use Worcester Salt is put up in 28 and 56 pound Irish linen bags and 14-pound muslin bags. Good grocers everywhere carry Worcester Salt. Get a bag.

vigorous on a variety of feeds and regular feeding, while there is a direct relation prevailing between inactivity and lack of exercise on the part of breeding animals and mortality of their brooded young. F. C. M.

Products, Prices and Trade.

PRODUCE RECEIPTS AT NEW YORK.
Week ending April 23.

Butter, lbs.	2,724,240
Eggs, doz.	5,196,600
Apples, bushels	61,834
Potatoes, bushels	179,800
Hay, tons	4,520
Wheat, bushels	238,080
Corn, bushels	21,150
Oats, bushels	326,400

Wholesale Prices at New York,
Week Ending April 24, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 6-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high-scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are running $1.61 and $1.51 for B and C. Hotels and restaurants using two to three cans per day are paying 5¼ to 5½ cents per quart.

BUTTER.

The receipts of fresh creamery, of medium and lower grades, are in considerable surplus of demand. High scoring new stock is moving quickly. There is a fair demand for factory and packing stock of medium to good grades.

Creamery, extra, lb	25	@	25½

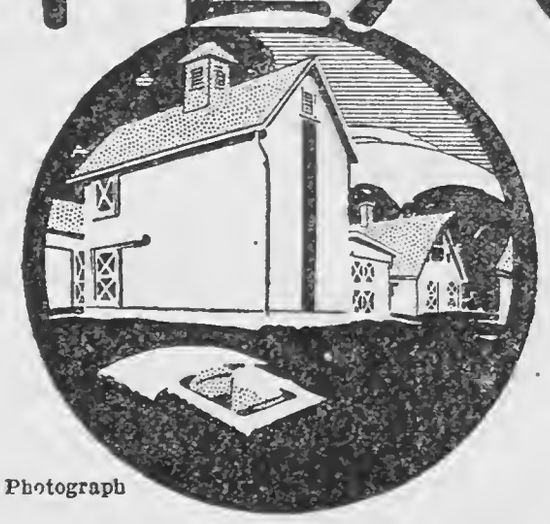
ATLAS



Drawn from a Photograph

The ice house and root cellar are two necessities on the modern business farm. Just ask the U. S. Dept. of Agriculture what materials they recommend for building them.

But make no mistake—the concrete should be made of Atlas Portland Cement. The neighbor who has used Atlas can tell you why. Ask him, and ask your dealer for Atlas. You'll be glad you did.

I'll Feed Your Stock 60 Days Before You Pay

I don't ask you to pay me one single cent until you have fed SAL-VET for 60 days and seen with your own eyes its wonderful merit as a worm destroyer and conditioner.

The Great Worm Destroyer SAL-VET

Makes all animals thrive better, look better, **destroys and expels** intestinal and stomach worms which prey upon the digestive tract, robbing your animals of vitality and strength, and keeping them in an unthrifty and unprofitable condition. **Read this:**

"I used to lose a good many hogs until I fed them SAL-VET. Only this last season, hogs died on the range all around here. I had 70 head on the same range, but mine kept well, and came in every day for their SAL-VET. At different times I have fed all kinds of stock medicines, but SAL-VET is certainly king of them all." A. H. HYDER, Evening Shade, Mo.

PRICES 40 lbs., $2.25; 100 lbs., $5.00; 200 lbs., $9.00; 300 lbs., $13.00; 500 lbs., $21.12. No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold by peddlers nor in bulk; only in Trade-Marked Sal-Vet packages. Shipments for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular packages.

I'll Stop Your Losses From Worms or No Pay

I have shipped tons and tons of SAL-VET to readers of this paper who have accepted my no-money-down offer. You have everything to gain and nothing to risk in testing SAL-VET.

SAL-VET The Great Live Stock Conditioner

will put your stock in fine condition, make them sleek, thrifty, vigorous and healthy.

Send No Money

Just the coupon. Tell me how many head of stock you have and I'll ship you enough SAL-VET to feed them 60 days. You pay the freight charges on arrival and feed as directed. If SAL-VET does not do all I claim, I'll cancel the charge — you won't owe me one cent. Send now to

The Henyard.

Questions in Hen Feeding.

Is green bone and meat good for hens in the Summer? Is a wet mash as good for hens in the morning as a dry one? Would you advise me to raise beets and carrots for hens in Winter? F. W.
New York.

Green cut bone may be fed in the Summer if care is taken not to allow it to become tainted or to use bone to which tainted meat is attached. It should be fed in moderation, and is, of course, not so much needed by fowls that are on range and able to pick up bugs and worms. When dry mash is fed it is not given in the morning or at noon as a single meal, but it is kept before the fowls either all day or through the afternoon, usually the former. The hens are allowed free access to it at all times, as they will eat but a mouthful or two at a time and will not gorge themselves with it as they would with wet mash if they had opportunity. Most poultrymen prefer to feed dry mash in this way rather than to give a wet mash once or twice daily. It saves labor, and the results in the long run are undoubtedly quite as good. Either mangels or cabbages should be raised for Winter feed for fowls if practicable. They are probably about equal in feeding value, and the choice between them will depend upon which can be raised and stored to best advantage. As a rule, mangel beets will have the advantage in these respects. M. B. D.

Another Turkey Record.

Though not expecting any championship honors I can bring forward the laying records of two turkey hens that can beat the one on page 241. During the season of 1912 a black hen laid 80 eggs, the other a Bronze, laid 86. These eggs were all laid before either hen showed any desire to sit. They were set July 6 and 13 respectively, and although the poults were late hatched they were ready for the Christmas market at eight to 12 pounds. During the season of 1913 the same black hen laid 17 eggs, then set, and when her brood was three to four weeks old began laying again, laying 81 or 98 in all. The same Bronze hen laid 16, set and when her brood was a few weeks old laid again, this time laying 89, making 105 eggs for the season. This record makes no account of broken eggs, of which there were a few. Another hen in our flock, a Bronze, laid a total of 68 eggs and raised two separate broods, both of her own hatching during the Summer of 1913. BERTRAM M. BALL.
Vermont.

Loss of Feathers; Feeding Chicks.

1. My chickens get bare spots right in front of the tail. I don't know what causes it, looks ugly but it has no effect on laying. Could you give me a remedy for it? 2. What is the proper feed for baby chicks? A. A. S.
Englishtown, N. Y.

1. These bare spots may be due to the work of depluming mites, or, possibly, to the habit of feather pulling. A little lard or vaseline to which one fourth of its bulk of blue, or mercurial, ointment has been added, well rubbed into the bare places will destroy the mites and permit new feathers to grow. 2. Baby chicks may be started on bread crumbs moistened with milk, rolled oats, crumbled johnny cake, fine grit and water, and after a day or two, hard chick feed composed of one part pinhead oat meal, two parts finely cracked corn, and three parts cracked wheat. A mash kept before them dry in little trays, and also fed moistened alternating with the hard feed, may be made up of three parts each of wheat bran, wheat middlings, corn meal, and sifted beef scrap, to which one part of bone meal may well be added. Baby chicks should be fed five times daily for the first few weeks, a little at a time, later the meals may be reduced to three daily, a moist mash being given once. M. B. D.

Paralyzed Fowls.

Several times lately, I have noticed that a few of my flock of S. C. White Leghorns seem to lose the use of their legs for a short time. I have put them in "broody coops" and within 24 hours they apparently are all right again. They usually seem to be some of the best birds and heaviest layers. Their vitality seems unimpaired, as they flutter around, close to the floor, using their wings only. Combs and eyes are as bright as usual. Mortality is very low. Cement floors seem to gather moisture more this Winter than last, and when the floors are cleaned, I have used ground limestone on the floor in order to dry it. Could you give me any idea as to the cause of this trouble? E. H. H.
New York.

Temporary paralysis of the legs is a common affliction of fowls that have been closely confined and heavily fed for some time; it is believed to be also due to rheumatism contracted in damp, ill-ventilated quarters. Removal to a dry warm place and the administration of a dose of physic, as a teaspoonful of castor oil, usually suffices to cure cases of moderate severity. Occasionally it is necessary to kill fowls that do not recover. M. B. D.

THE EGG-LAYING CONTEST.

In the twenty-fourth week of the contest, 3,590 eggs were laid as against 3,607 the previous week. The total number laid by all the pens is 41,606.

Waveny Farm's Barred Rocks tie with A. B. Brundage's S. C. R. I. Reds for first place in the week's score, each pen laying 55. Pen No. 41, White Leghorns from Storrs Agricultural Station, takes second place with a score of 51. This is not the "sour milk" pen. Merrythought Farm's White Wyandottes tie with N. W. Hendrix's pen of White Leghorns for third place each laying 53. P. G. Platt's White Leghorns laid 52, as did D. J. Ryan & Son's White Wyandottes. Five pens laid 51, and six pens laid 50.

The value of these egg-laying contests to the poultry industry of the United States, is far greater than most people think. That each succeeding contest should show a gain over previous contests, is certainly an indication that progress is being made in producing better layers, and a gain of only a half dozen eggs per hen in a year, means millions of dollars in the pockets of American poultrymen. From careful observation I have come to the conclusion that the demand this year for eggs for hatching and for day-old chicks, is greater than it has ever been before. A friend of mine has started a new idea, new to me at least; that is, custom brooding. For five cents a week he will take day-old chicks and raise them for customers. Chicks will be marked and recorded, and put into mammoth brooders, and carefully attended to. It opens a new field for poultry work.

At the Storrs contest the Barred Rocks make the highest pen average of any breed, taking the place which the White Wyandottes have held until now.

The records for the week are given below, also the totals:

H. K. BRUNNER, 45 Harrison St., New York

Amatite ROOFING

Tested by fire!

THE mineral surface of Amatite Roofing makes painting entirely unnecessary. But that is not its only merit. It also gives superior resistance to fire, for it presents to the fire a mineral surface.

The following testimonial from Oneco, Conn. is one of many on this point:

"Amatite is the best roofing that is made. It is fire-proof and I can recommend it highly. A building about three feet from my house burned down, and the Amatite on my house kept the roof from catching fire, and the building that burned was higher than the house roof."

(Signed) SAMUEL D. ROSE.

Booklets and samples will be gladly sent free on request. Address our nearest office.

RHODE ISLAND REDS

The famous Vibert flock of beautiful, brilliant, glowing cherry to mahogany red-to-the-skin rose and single comb thoroughbreds. Not uncertain layers mated to males from uncertain layers, but specially selected, long backed, low tailed, certified trapnested record layers, scientifically line bred along Government lines for heaviest winter egg production, with yearly trapnest laying rates of 211 to 267 eggs; bred away from broodiness, and mated to large, vigorous, brilliant red males out of heaviest trapnest record layers. Heaviest winter laying, large, hardy Reds in America, hen hatched and raised, on absolutely free range, in wide-open front colony houses, on a scientific plant absolutely free from roup and white diarrhoea. Highly fertile, clean, well shaped, unblemished eggs, gathered hourly, shipped daily, delivered when wanted, guaranteed unbroken. Vibert Vitality Day Old Chicks. Splendid breeding cockerels from trapnested hens, trios, mated breeding pens for sale. Prompt shipment, safe delivery all over North and South America, courteous, strictly upright dealings. Mating booklet upon receipt of stamp.

PUBLISHER'S DESK

Last December two men visited this village asking permission to photograph residences, children of the household, etc. A few days later two others returned with proofs soliciting orders for pictures and post cards at the rate of $1 per dozen. Many orders were given, and we were told the pictures would be sent by mail. Receipts bear the name of The Advance Stock Negative Company, 761 East 133rd Street, New York. Letters addressed to them have remained unanswered. I. M.
New York.

Our letters were forwarded to Easton, Pa., and returned from there unclaimed. This would indicate that the company finds it more convenient to move from place to place rather than continue at any one address. But why pay for pictures before they are in your hands? They asked the money? Oh, yes; but you were not obliged to hand it over until you got the pictures. If they will not trust you, do not trust them until they show themselves more worthy of trust than you are.

I note in your issue of April 4th an inquiry as to the Empire Realty & Mortgage Co., and the loaning of money at 5%. In this connection I am sending you a contract such as has been issued in Florida. As you state in your explanation, the whole game rests on what is called the "eligibility clause." The agents lead you to suppose that at the end of six months, by making a six months' lump sum payment which will make the payments for a year, you will be able to get your money. As a matter of fact if anyone will take the trouble to do a little figuring it will be easy to see that mighty few people will get any money and the whole thing should be branded as a fake. Last year the laws of Florida were changed so that it is impossible for these companies to operate here, and as a result some of the officers of the different companies have been arrested and they have ceased to do business.

The game was first started purely to induce people into it in order to get their initial six months payments and then have them drop it. It worked all right and I understand the Birmingham company you refer to made thousands of dollars out of their victims, and they educated the people who afterward started the same game in other parts of the South. The contract, I understand, was drawn by one of the South's greatest lawyers and there is no flaw in it as far as the company is concerned. At first sight it looks more than fair, but after you have figured it over for a while and looked into some of the settlements you will soon see where you come out. You simply can't tie them to anything definite, so the best thing to do it to let it alone. A. H. B.
Florida.

This letter states the conditions of the installment contract very clearly. The promise of an easy loan is a great inducement to the man who wants to borrow; but the company wants deposits, not an opportunity to loan money. When you have made payments for six months, you discover that the company has done nothing but promise that you are "eligible" for a loan. They have not bound themselves to give you anything, but you have contracted to keep on making payments whether they make you the loan or not. We are glad that the State of Florida has put the ban on these contracts. The States and the courts are fast coming to see that a free contract is not always a fair or a just contract. We must come to the principle that it is the duty of the State to protect the inexperienced and innocent from the allurements of craft and cunning.

Referring to the reference on page 206 to an alleged purchase of land by the Thwing Company, or the Circle Magazine, at Demarest, N. J., for promotion purposes, being a resident of Demarest I have examined the records and find no property assessed to Mr. Thwing or his company. From the item referring to the Thwing scheme some one may get a wrong impression as to the village of Demarest. This village is 20 miles from New York, and three miles from Englewood. It is only 25 minutes walk from the trolley, which will soon be extended to the village. We have 38 trains daily. The town is beautifully located, and has many distinguished citizens. While we repudiate promoters, we do not want their unauthorized references to allow any misapprehension of the beauties and advantages of our home town. C. F.
New Jersey.

While we think our correspondent above is needlessly sensitive, we are glad to know that he has the home instinct. We did not intend our reference to Mr. Thwing's scheme to cast any reflection on Demarest. What we wanted our people to understand is that land 20 miles from New York is no more calculated to yield 100% profit as promised by the Thwing Company than property situated elsewhere, and in this case we can only repeat our standing advice, always to see land and know its value before making an investment in it.

An ordinance passed by the Aldermen two weeks ago making it a misdemeanor to publish false or misleading advertisements became a law yesterday without the Mayor's action. The bill covers all kinds of advertising and the penalty is a fine of $25 to $250 or imprisonment for five days to six months or both.—New York City Paper.

This law was passed at the suggestion of the Vigilance Committee of the Advertising Men's League. It would not be necessary if publishers would do their duty by the public. If the Vigilance Committee follows up violations of the law and insists on prosecutions both publisher and advertiser will reform, and everybody will gain by the reform.

Governor Glynn has signed the bill prepared by the Commission appointed by Superintendent Van Tuyl to revise the banking laws of the State of New York. This law provides for an investigation by the Superintendent of Banks of violations of the law by individuals or corporations which do something of a banking business, though the companies are organized under the general business law, and the individuals conducting the business seem to be operating without proper authority of law. As Governor Glynn has pointed out, recent decisions of the court have held that the real estate investment companies which issue debentures and installment contracts are acting in violation of the law, and a final decision on this point is pending in the higher courts. If the decision is sustained, as is probable, the authority of the Superintendent of Banks to investigate such violations will probably be sufficient to protect the inexperienced investor against the agents and allurements of fake real estate promoters in this State. For 20 years I have been fighting these schemes; and it is gratifying to consider that at last we have found a means of regulating if not suppressing their operations. Effective regulation would be equivalent to suppression, because to take the fake out of them is to kill them.

As there cannot be a great deal in the business at a dollar per year for such a paper as yours, and as it must come to considerable to notify all of your subscribers, please bear in mind that you might as well save—as far as I am concerned—your stamp, as I shall most likely not fail to resubscribe even at twice your price, and do it in ample time.
Michigan. H. P. H.

Our correspondent touches an important subject in this letter. For the most part THE R. N.-Y. subscribers renew regularly from year to year. They belong to an organization, and pay their dues annually. We think such faithful and persistent patrons are entitled to the courtesy of an individual notice by mail when the annual renewal is due. The postage for this one notice alone, amounts to about $2,000 a year. In addition to this there is the printing, addressing, inserting and stamping of the two hundred thousand letters or thereabouts. While we appreciate the interest of our friend who writes above in saving this expense, we consider it a courtesy that we are glad to extend. What we would like to avoid, however, is the expense of a repetition of this expense. Some of our friends whose original subscription dates back of our present records of 15 years, overlook or neglect the notice, and it is necessary to repeat it one or more times before the renewal comes along. There are good reasons and legitimate excuses for much of this; but a large percentage of it is probably due to a mere oversight, as a result of a feeling when the first notice is received that there is time enough in a day or two. Each one does not realize, as this correspondent evidently does, that if everyone delayed the renewal after the expiration notice was received, necessitating a second notice, the expense would be something of a burden, and we would be short just that much in the quality of service we could give through the paper as a whole. We print the letter as an example of a good purpose and a commendable practice. J. J. D.

You Must Paint!

Every building or shed on your farm needs paint every few years, just as your stock needs food every few hours. Your stock will starve if neglected. Likewise, your buildings will rot or decay if you neglect them. And use the best paint, just as you select the best feed.

Lucas Paint

65 years' paint-making experience is the Lucas record. Every can of Lucas Paint is the result of this vast experience combined with Lucas brains, Lucas equipment and Lucas perfect factory system. This paint-making efficiency makes possible the highest quality paint standard. Every can of Lucas Paint must match this standard after four exacting tests.

FREE Expert Advice and Book "When and How to Paint"

Send at once to our Service Departmemt for free advice on your paint problems. It will save much of your paint money and cost you nothing to get. We will also send our paint book, "When and How to Paint." Write today.

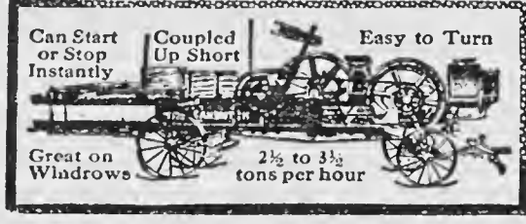
Big Tonnage! Big Profits!

No delays, sure, certain operation. These are yours with the fast working Sandwich Motor Press. Many owners make enough clear cash to pay for their outfits the first year—$200 to $300 clean profit each month. One Sandwich owner writes he baled "32 tons in 8 hours with a 3-man crew." Another how he averaged $18 to $22 per day after paying all expenses. These men can do this because they have the right press. 20 years experience built into it and special patented features found only on the Sandwich press—these are the reasons Sandwich owners make more money than others. The Sandwich way, the sure way.

SANDWICH Money Maker MOTOR PRESS has a hopper cooled gas engine mounted on same truck, 4, 6, 8 or 10 h. p., of more power than rated. Geared magneto. Full engine power delivered to Press by heavy steel roller chain. No power lost, no belts to slip or to delay. Simple self-feeder and the big feed opening just swallows the hay. Friction cluteh right on press.

SANDWICH SOLID STEEL HAY PRESSES



Free Book! The Way to Win

Send a postal today for our free catalogue "Tons Tell." It gives you reliable figures of the cost and profits of the hay baling; shows all the Sandwich Hay Presses, both motor, belt and horse power. Also ask for our special terms so you can buy your press from the profits made the first year. Write Quick. Address Sandwich Mfg. Co., 119 Oak Street, Sandwich, Ill. Box 119, Council Bluffs, Ia. Box 119 Kansas City, Mo.

Galvanized or Painted Roofing

Write to-day for free sample and mill prices. Send size of buildings, height and length of rafters and we will furnish free complete estimate of cost--then make comparisons and see the big savings.

Quality Guaranteed--Best Open Hearth Product

When you buy from us, you buy from the manufacturer. All galvanized Roofing and Siding have extra heavy tight coating of galvanize. Also makers of galvanized shingles for houses.

PRODUCTS, PRICES AND TRADE.

(*Continued from page 683.*)

RETAIL PRICES AT NEW YORK.

These are not the highest or lowest current prices, but are fairly representative of what the majority of New York consumers pay:

Eggs, fancy white, doz.	30	@	35
Mixed colors, new laid	26	@	28
Ordinary grades	20	@	22
Butter, fancy prints, lb.	32	@	34
Tub, choice	27	@	29
Chickens, roasting, lb.	30	@	32
Fowls	25	@	28

*

The muskmelon crop of Southern California will be large this year—probably 5,000 carloads, or not far from 72,000,000 melons.

*

We imported 38,000,000 pounds of glycerine last year. It comes largely from England, France and Belgium. About 30,000,000 pounds are manufactured in this country. A large proportion of the glycerine is used in making explosives, but it is of importance in medicine, the arts and industries.

*

The island of Dominica, British West Indies, is most important in the production of the lime, that small lemon-like fruit with an acid and flavor of its own. The annual crop is about 370,000 barrels. New York alone receives 35,000 barrels of the limes, but the heaviest part of the crop is manufactured into juice on the island, 600,000 gallons of the raw and concentrated juice being a normal year's output.

The Russian Government is preparing to irrigate 8,000,000 acres in Turkestan, which has been found suitable for cotton growing. The cost will be $360,500,000. Turkestan now produces 400,000,000 pounds of cotton, which is about half the raw material required in Russian manufacture.

Making a Start in Poultry.

I would like your advice on going into the poultry business. I have eight acres of land 18 miles from Buffalo and about one-quarter mile from railway station. The land slopes to the southeast, with quite a hill on the north and west sides. There is a never-failing spring on the property which would run by gravity to the poultry houses. The soil is a gravel loam underlaid with hard pan or clay. There are no trees on the place. Would it not be advisable to set out an orchard of apples, with peaches as fillers? The only building on the place is an old shop with basement, which could be made into an incubator cellar with very little expense. I have about $1,000 to start with, and could raise a few hundred more if necessary. How does the Buffalo market compare with the New York market? What kind of laying house would you advise? As to my experience with poultry, I have kept from 25 to 100 hens for the past six years, and have been able to obtain an average of $1.20 net profit per hen per year. I should expect to start slow and gradually work up to 1,000 or more hens if I made a success of the business. C. W. C.

New York.

It is difficult to reply or suggest in a limited space to an extent that would be most helpful. Your location with its slope and spring seems to be excellent. Trees for shade are desirable, really a necessity. Peaches when the trees were small would provide delicious dessert for the hens unless surrounded by poultry netting. Apples on the trees would not be troubled. Your intention to start slowly is a wise one. The style of laying house would depend upon your own preference and the breed of poultry. The smaller, more active breeds will usually stand more crowding than the larger fowls. As a rule small numbers in colony houses will lay better than a larger number in one large house. Do not waste money on expensive houses. Put it into the best birds from the best laying strain that you can get of the breed that you prefer, and keep that breed exclusively.

Unless you know reliable parties in New York to whom you can profitably send eggs and poultry I would advise beginning with the nearer market. If you could work up a private trade in gilt edge poultry products you would be less dependent upon the general market.

W. H. H.

Delayed Incubation.

Why did my eggs take from 22 to 23 days to hatch? I have a small incubator cellar 12 by 12, in which I operate one incubator. I kept a fairly even temperature, 102 deg., for the first three days, increasing to 103 deg., and the hatch did not show any signs of lack of moisture. Does too much moisture delay the hatch? I am not positive about the age of the eggs when set, as I gathered them from surrounding farms, but they claimed that they were not over a week old.

North Carolina. M. L. W.

Chicks should hatch in 21 days from time of placing them in the incubator, but this time will vary with the temperature maintained. If the machine is run at too low a temperature the hatch may be delayed a day or two, while if the temperature is kept too high, the hatch will be premature. Each machine should be run at the temperature recommended by its manufacturers, but in case of poor results, the thermometer used should be tested by comparison with a certified physician's thermometer to ascertain its accuracy. In your case, the temperature was evidently kept too low, and this may have been due to the use of an inaccurate thermometer. M. B. D.

Hatching Layers.

Recently another reader and myself discussed the best time to incubate for the production of early Winter layers. He claims that chicks hatched out by the end of April will be amply early. I think they should be earlier. Breed White Leghorns, flock of about 200. Will you give your opinion? B. A. F.

New Jersey.

Chicks hatched any time in April or early May may be made to lay in the Fall, if fed and cared for in such a way as to keep them growing continuously from the start. Much depends upon the care, as well as upon the age, in producing early layers. If it were practicable to do so, I should have every chick upon my place hatched during the first week in April, but I consider any time in that month satisfactory, and do hatch up to the first of June. M. B. D.

Leghorns With Colds.

What ails my hens? My S. C. White Leghorns seem to breathe hard and open their mouths as if it hurt them to breathe. These are the only symptoms I have noticed. I have used dust from barn floor in litter. Would this have any connection with the trouble, do you think? I did not know but what it might be roup, but the symptoms do not agree with those given. H. T. F.

Connecticut.

The most common obstruction to breathing noted in fowls is caused by the ordinary colds to which they are subject, but more serious diseases like roup may begin with this symptom. Some fungi derived from moldy litter at times find their way into the respiratory passages of fowls and obstruct breathing. Assuming that colds are responsible for the trouble in your flock, you should add permanganate of potash to their drinking water; making a stock solution of this drug by adding one ounce to three pints of water, and adding a pint of this stock solution to each two quarts of drinking water. Give them no other water to drink and see that they are not exposed to drafts or dampness in their quarters.

M. B. D.

Laying Ration; Feeding Chicks.

I have about 30 hens and only get three and four eggs a day. What would you advise me to feed them to make them lay better, and about how much feed ought a flock of hens have at once? The hens are all mixed stock. What would you advise me to feed young chicks when they are first hatched? F. G.

New Jersey.

There is no one food, or combination of foods, that will "make hens lay"; their laying is dependent upon many conditions, such as the age of the hens, the comfort of their surroundings, and their general care. All of the ordinary grains are useful though corn, wheat, and oats form the basis of all rations. Buckwheat and barley are also valuable additions to the whole grain diet. A part of the food should be given in the form of ground grain mash, fed either wet or dry, and to this mash meat food of some kind should be added. Skim-milk and buttermilk are very useful when they are to be had, and green stuff is also necessary for the best results. A flock of hens ought to have all the food that they want; they will not lay if scrimped. It is not necessary that any exact combination of foods be used but formulas for making well balanced rations are frequently given in these columns. These combinations give better results than haphazard feeding and are the result of experiment and study. Stale bread crumbs moistened with skim-milk, johnny cake made of cornmeal, rolled, or pinhead oats, and finely cracked wheat and corn are all excellent foods for young chicks, and may be fed from the start until the chicks are old enough to eat coarser grains and such ground grain mashes as are fed to mature stock.

M. B. D.

Catarrh of Crop.

Will you tell what to do for a hen that has her crop filled up with water, also what the cause of it is and what it is called? If the hen is held up by the legs the water will run out of her mouth, then she will fill up again. B. C. M.

Concord, Mass.

This is probably catarrh of the crop, or "sour crop," due to indigestion or the eating of improper food. A physic, such as a teaspoonful of castor oil, may be given the bird; after its operation the crop may be emptied by gentle pressure with the head held down and a little soda given in water to counteract the acidity of the crop contents. A few grains of subnitrate of bismuth suspended in water and given once a day will also aid. The fowl should be placed by itself and fed upon soft easily digestible food until it recovers. M. B. D.

Hot-water or Hot-air Incubator.

Is a water heated incubator better than a hot-air heated? C. L.

Pennsylvania.

It is utterly immaterial whether an incubator is heated by hot water or hot air, so far as hatching is concerned; both are successfully used. The choice, then, becomes one between some particular hot water heated incubator and another heated by hot air. So far as my observation goes, the higher priced, higher grade, machines use hot air, while the cheaper ones are heated by hot water, but the choice should be made after considering the merits of the machine as a whole, and should not be based solely upon the method of heating. M. B. D.

When you write advertisers mention The Rural New-Yorker and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : : : :

THE BEST FARM IN NEW JERSEY at $10,000, I honestly believe, is one of 136 acres just out of Washington; near trolley. House of 9 rooms, bath, furnace; excellent outbuildings, with slate roofs. Land slopes south-east; 127 acres cultivable. E. E. SLOCUM, 141 Broadway, N. Y. City

FARMER'S SECURITY BUREAU, NEW YORK
Help, Farms, Estates, Institutions. Write. Phone 6186 Cortlandt. Agency Maintained by qualifications, men placed. Have no branch. Sidney Sullivan, Expert, 99 Nassau

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References Investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

Eight Dollars an Acre for 240 acres, 4½ miles from Lee, Berkshire Co., Mass. Altitude, 1,900 ft.; ½ mile from pretty lake. 60 acres cultivable, balance, pasturage and woodland. 6-room house, 2 barns. Poor land; poor buildings; but great bargain. E. E. SLOCUM, - 141 Broadway, N. Y. City

DO YOU NEED FARM HELP
We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII. No. 4254. NEW YORK, MAY 9, 1914. WEEKLY $1.00 PER YEAR.

GROWING PRIZE STRAWBERRIES.

The Man, the Berry and the Work.

RETIRED FARMERS.—In every town or city where there is room for gardens you will find "strawberry cranks" who have learned how to produce the finest fruit. These are usually elderly men—often retired from the active business of life. Energetic and restless, they are not content to sit down and talk and wait, but they take a small piece of land and perform upon it miracles in fruit and flower production. We know of one such man—a "retired farmer." He worked his farm as long as he could do so profitably. His boys were all girls, and they married and moved away. So this farmer finally sold out and with his wife moved to town. Now this man had followed the history of many of these "retired farmers," and he observed that out of about 15 couples who had left the farm while in good general health there were now 10 widows, three rather old feeble men and two well preserved. Thirteen of these men had dropped their habits of industry when coming to town. Instead of working steadily through the day, with their minds occupied with plans for the farm, they sat about at the store or post office, or talked aimlessly with old cronies on the street. At the same time they kept on eating as freely as when they were hard at work. They lived on through a few peevish and unhappy years and then dropped away. Their wives did their own housework as they did on the farm, kept busy with fair exercise and survived their husbands. The two men who kept their health took up some light manual labor and saved their lives by keeping busy.

So this "retired farmer" was wise. He bought a house with a good-sized piece of land, started a garden and built a small greenhouse. What he did on that less than an acre was a wonder. When he came to town he had expected to live on the proceeds from the sale of his farm, using the interest and part of the principal each year. To his surprise he found that his garden and greenhouse were supporting him—actually giving him a larger income than his large farm had given during the few years before he left it. This man was a good farmer, but he had become a "gardening crank," and that is a step up the scale.

"CRANKS" AND CRANKS.—There are two kinds of cranks. One is impractical, the other is an expert who pays little attention to the rules which others lay down for him, but does what his instinct tells him to do. A "strawberry crank" does not pay much attention to printed rules in books or papers, but he "asks the strawberry plant" what it needs. As a rule the "strawberry crank" cannot tell you how he does it, and the beginner could not understand it anyway until he has watched plants develop through every growing day for several years. There is a difference between a "crank" and a crank. Some years ago a man wrote us that he had invented a sure and cheap way of killing the San José scale. We must pledge ourselves not to reveal his great secret. Then he came and said, "I never saw one of these scales—will you send me a twig carrying some of the insects?" Here was a man sure that he had a remedy for a trouble he had never seen. He was a "crank." Another man for the past 20 years has contended that the scale will finally be conquered and kept in check by parasites. I think he is a far-sighted crank, and that in the future his theory will prove true.

SOIL AND PLANTING.—If you could get the strawberry crank to talk about details he would probably tell you that the way to produce prize berries is about as follows: Get your plants started as early in the Spring as possible. Take larger plants of last season before they have made much top. You must have strong, rich soil, full of organic matter, so that it will not bake hard near fruiting time. It is better to take soil which has been well hoed and cultivated for

"THE STRAWBERRY CRANK" TURNING OUT PRIZE BERRIES. FIG. 281.

several years, so as to avoid white grubs. The cultivating destroys these nasty insects. We would rather plow or spade in pea or bean vines, or cow peas, than to put in manure, but the soil must be rich and full of some sort of organic matter if you want prize berries. An old sod is worst of all, both on account of the white grubs and the trouble in keeping the grass and weeds down. Plow or spade the ground *deep* and rake or harrow the surface down level. Get your plants as fresh from the field as possible, and do not let the roots be exposed to the sun and air for a moment. Keep them covered with damp moss or soil. Nip off about two inches of the roots, and if the stems are well grown nip them off and leave new foliage to grow from the crown. We do not plant the fruit tree exactly as it comes out of the nurseryman's box—why should we the strawberry plant?

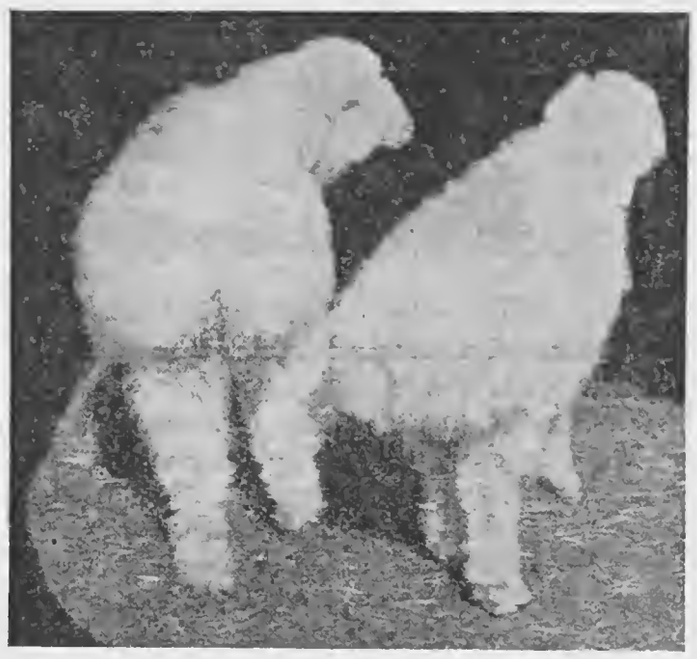
THE RIGHT KIND.—If you are after big, fancy berries you must take certain varieties which are naturally poor plant-makers and shy bearers. If you want milk testing 5% or more of fat you get a Jersey or a Guernsey cow, because it is the nature of these breeds to make that kind of milk. It might not pay to keep them if you were shipping three-cent milk to the city, but if you are after "quality" milk you know where to go after it. Much the same with strawberries. It is the nature of some varieties like Marshall, Chesapeake, Mary and the old Parker Earle to grow in hills if you help them a little, and produce a comparatively few great berries rather than many small berries and runners.

HOW TO PLANT.—Planting 2½x2 feet is good practice when you bed out the hills. In order to get the best fruit the berries should not be shaded too much, as they are in matted rows. There will be a fringe of fruit around the outer rim of the hill, and this should meet the sun. In planting we would not dig a hole, but push a flat trowel or spade into the soil and work it until there is room to put in the plant. With a quick flirt of the hand shake out the roots fan shape and put them in behind the spade. Pull this out quickly and the soil falls in around the plant. Get it down so that the crown is just above ground and firm the soil around it level. Do not under any circumstances *pinch the soil around the plant and leave the hard pinched mass there.*

FERTILIZERS.—The time to fertilize the strawberry is when it is planted. It is a close feeding plant—that is, its roots do not extend out into the row like those of corn and potatoes. Its food must be soluble and put up close to it. In properly fitted soil chemical fertilizers are best. You can use one of the ready-mixed fruit or truck fertilizers, or mix the following: One part, by weight, nitrate of soda, one part dried blood, three parts fine bone, one part sulphate of potash. From choice we should scatter this in a strip about a foot wide where the row is to be and rake or cultivate it in before planting.

NOW FOR WORK.—Thus far it has been pretty much all play—now the real work begins. These plants must be hoed or worked twice a week until August, and watched with a critical eye to know just what to do with them. The so-called lazy man's way is to put a thick mulch of clean straw all over the ground. This keeps most of the weeds from growing. A few come up through the straw and can be pulled by hand. You will have better plants and better berries if you keep the mulch off and depend on a sharp scuffle hoe to keep down the weeds. This sort of a hoe does not dig, but slices and cuts the upper soil crust without disturbing the roots. In a rich garden soil it is a good plan to sow lettuce or radishes or even dwarf peas between the strawberry rows—anything that will not shade the plants. Keeping these crops clean will help in hoeing the berries. They must be kept clean, and the soil must be kept stirred up until August at least. There will be some bloom on these plants. In commercial culture we let this bloom alone to make berries, but when you are growing fancy garden berries it will pay to nip this bloom off and prevent fruiting. Late in June runners will begin to form. Now comes the instinct or judgment which only the true crank may know. What you ought to do is to lay down or root three strong runners around each plant you set out. This is called the parent plant, and the "hill" you are after will comprise this plant and three of its strong runners rooted evenly around it. It will require judgment to select the three best ones and put them in the right places. When they are thus placed every other runner which this hill makes should be nipped off as soon as you can find it. It is in pruning off these runners that the ordinary strawberry crank falls by the wayside, for it is dull, monotonous and back-breaking work. It can be done in a garden, but would not pay in commercial culture.

JUDGMENT REQUIRED.—In August there will come a time when more instinct is required. We all know the modern theory of handling a peach orchard. The plan is to feed well in Spring and give the most thorough culture up to July or August. This produces a fine growth of wood on the trees. By the middle of July these trees usually have all the new wood they ought to carry. If they keep on growing wood they will not make strong fruit buds, and the wood they have already made will not be ripened or hardened for Winter. So the object is



THE TAILLESS RUSSIAN SHEEP. FIG. 282.
(See page 705.)

to *stop growth.* This is usually done by seeding a cover crop or letting the weeds and grass grow naturally. These living crops take the moisture and available plant food in the soil, and the tree stops growing and ripens its fruit and starts fruit buds for next year. Now in something the same way these hill-grown, rank strawberry plants should be started in August into making their buds for next year. We cannot handle them as we do the peach trees, and keen judgment is required. We may in some cases use a mixture of acid phosphate and potash. This contains no nitrogen, and will not stimulate growth, but help the formation of fruit buds. We may cover the ground with a thick mulch of chopped straw or coarse hay. This prevents weed growth and with the potash and phosphate will help the bud formation. In some cases where the leaf and stem growth is extravagant it will pay

FRUITING HABIT OF JABOTICABA. FIG. 283.

to make a thick seeding of oats and barley right among the berries. This will act much the same as a cover crop in a peach orchard. This crop should not be permitted to grow too high, and the runners should still be cut from the berries.

THE OVERCOAT.—Just before the ground freezes the entire patch should be covered with a thick mulch of coarse straw, hay or stalks. A strawberry overcoat should not fit down close to the plants. They must breathe. You do not need to prevent their freezing, but you want to prevent freeze and thaw during the early Spring, or on sunny Winter days. The next year you loosen the mulch to let the plants go through, and you have them much like those shown in the picture. The strawberry crank is completing his job by applying a little more of that fertilizer at blooming time. Then he will put back the mulch and wait for the harvest.

FITTING SOIL FOR GRASS.

I have a field of about eight acres which I would like to get seeded to grass for hay. It is rather light sandy soil; have had it in rotation of crops for the last 18 years; hay two years, pastured two years, then plowed and planted to corn one year. The next year would reseed to clover and Timothy with a cover crop of oats along with the grass seed; the grass seed would make a good start after seeding, but when the hot sun came on in July and August the grass would all burn out. I have been doing this for the last five years. I have had corn on this land now two years, and wish to reseed again this Spring or Summer to grass seed. I have thought of trying another way to get a stand of grass seeding. This land, no doubt, is run out badly as I have never put on any manure, as we have none to put back. Would you consider it wise to sow Velvet beans on this land and plow under, or Giant spurrey? Which of these two would you advise to be sown and plowed under the latter part of July or the first of August, then put in the grass seed? I intend to sow one ton of commercial fertilizer when I sow the grass seed about the first of August, or what would you advise to do better? This Giant spurrey and Velvet beans are both something new to me, as I have never had any experience with either of them. They are highly recommended in the seed catalogue to grow great crops on very poor soil. I also want to put on lime. When would be the best time to do this? Will it be all right to put on lime just before I sow grass seed and work it in first? T. M.
Michigan.

If that field were on our own farm, we should say that it needed both lime and humus, in order to make it fit for growing a large crop of grass. Natural grass land is porous enough to hold moisture well. This light soil evidently has little organic matter in it, and therefore dries out rapidly during a drought. Once get it well seeded to grass and clover, and the decaying roots of the sod will help keep up the humus supply. We should spend the earlier part of this year in filling that soil with organic matter, and then seed to grass alone next Fall. There is no use experimenting with untried cover crops just because you see them mentioned in the seed catalogue. When any seedsman booms an untried plant of this kind, and claims great things for it, you may safely conclude that he is trying to fill his pocket with money, rather than to fill your soil with humus.

The Velvet bean will do well in the South. We have seen the vines in Florida so long that they literally chased a man out of the cornfield and climbed trees along a field 15 or 20 feet high. Because they did that in Florida, there is no reason that they would do the same with you, and in your position you would far better stick to the old reliable crops which have been proved serviceable again and again. Instead of trying spurrey and Velvet beans, we should work that land up as early in the Spring as possible, and put in a heavy seeding of Canada peas and oats. Use a fair amount of a soluble fertilizer to push these crops on. In late June plow the whole mass right under, and put one ton per acre of air-slaked lime on the furrows and harrow in, rolling the land down hard so as to pack down the cover crop after plowing. Then two plans are open to you. One is to keep that ground thoroughly stirred up again and again through the later Summer until September, which is the time for seeding. The other is to sow a heavy seeding of buckwheat and rape, immediately after putting on the lime when the peas and oats are plowed under. Let the buckwheat and rape grow until the latter part of August, and then plow them under, working cross-wise from the first plowing. Then fit the soil as well as possible, and put in a heavy seeding about the middle of September. Put the grass seed in alone after fitting the soil perfectly, and grading it so as to prevent hollows or uneven places. You will find that this stuffs the soil with organic matter, and using lime freely, will make this field hold moisture better, and enable the grass to make a far better start, and give a better crop.

HERE is something of a new argument for sheep, coming from the Canadian Northwest:

Of the three hundred known Saskatchewan farm weeds, the sheep will eat and make splendid mutton of no fewer than 260, while stock and horses will merely take 60 or 70 of them. Where Summer fallows are fenced, a flock of sheep will keep down the weeds which absorb so much of the precious moisture, converting them to a fat profit in mutton.

There is no question about the weed-killing power of sheep. Many nurserymen and gardeners keep a few sheep to tidy up the lanes and fence corners by cleaning out the weeds. There should be more of them kept, and there would be—but for the cur dogs.

TRANSPLANTING ALFALFA PLANTS.

[A year ago Prof. N. E. Hansen of the South Dakota Experiment Station, wrote us about his plan of transplanting Alfalfa in the dry Northwest. The little seedling plants were started in drills, dug up somewhat like cabbage and celery plants, and put in with one of the horse power plant setting machines. We wrote some of the best Alfalfa experts in the Eastern States about this, but most of them had never heard of it. Now we have the following further statement from Prof. Hansen, in answer to a question. As you will see, he does not yet advocate this plan for general use except under some conditions in the Northwest.]

In some of the limestone sections of New York State Alfalfa does well, but in other sections it has been almost impossible to get a stand that would last. Many people (farmers) in this section have made a brave effort to grow it and most of them have given up with disgust at the results. Personally I have been studying Alfalfa for many years, but have had a farm for only three years on which to try it out. I believe that I am on the right way now, if I can get some hardy plants, and am therefore greatly interested in Prof. Hansen's plan of growing and setting plants. After reading his bulletin and circular, I am convinced that it is a very practical way, not only for seed, but for hay as well, and I certainly will give it a very thorough trial

It has been a year since the bulletin was written and I would like very much to know how the past year has affected Prof. Hansen's opinion as regards the setting of fields of Alfalfa plants for hay, and how far apart he would recommend their setting for a hay crop, with the idea of cultivating the first year or so until the crowns cover the ground. Last Summer I put in a five-acre field to Alfalfa in the usual way, sowing 20 pounds per acre. This field has good natural drainage and we limed thoroughly, inoculated the seed with the bacteria for Alfalfa, gave exceedingly thorough tillage and in short did everything according to the New York State rule. It went into Winter in fine shape, is now covered deep with snow and we are wondering how it will look in late Spring and Summer.

If you try transplanting dig your plants in the Fall, as the bark is too slippery in the Spring. Also, transplanting in the Fall after a grain crop will probably be better than in Spring: unless you have a good cellar to store the plants to keep them back till the rush of Spring seeding is over. My machine transplanting method for Alfalfa was designed primarily for the dry uplands of the Far West, wherever the soil conditions are unfavorable for getting a stand of Alfalfa, as the plants dry up before the roots get to moisture. It was also intended to be a certain method of spacing Alfalfa plants on the driest uplands where no irrigation is possible.

The old method of 20 pounds of seed per acre means 106 seeds per square foot. The experience of many farmers who are working with me on this upland problem indicates that for the driest uplands in the Far West each Alfalfa plant should have eight or nine square feet. The varieties of the Russian and Siberian Alfalfas that I am working with have very often 500 stems per plant by the second year: each crown covering one or two square feet. Such plants must certainly be given more room. In the Eastern States the largest rainfall in my opinion, will allow for a much denser plant population. That is, many more plants can be raised on the square yard. The hay will also be finer.

I shall be pleased to get your experience later. I am not ready to recommend the transplanting method to the farmer. For the uplands of the Far West, farmers have been forced into the method of raising seed in cultivated rows far enough for cultivation: usually three feet, owing to the limited moisture not permitting denser sowing. But wherever this is necessary, I believe we can give the plants more space and greater certainty by the plant method than by the seed method. They will also survive the attacks of blister beetles and other insects the first year, which are sometimes disastrous to Alfalfa plants just coming up from the seed. Yields of five to six pounds are not uncommon from transplanted plants the first year. I wish no one to believe it faster than can be shown by field demonstrations. At all events it is a quick method of raising pure seed of new varieties. In 1913 at this station 350,000 Cossack and Cherno Alfalfa plants were grown from 3½ pounds of seed on a little over an acre of land (exactly 1.13 acres). This would set 72 acres at 3x3 feet or 4860 plants per acre. The longer I work at the problem of Alfalfa for dry western uplands, the more I become convinced that transplanting one year plants into cultivated rows with suitable machinery is a safer and surer method than sowing the seed in cultivated rows, as the plants have one year's start and can stand more hardship the first year.

South Dakota Experiment Station.

FEDERAL SLAUGHTER HOUSES.

Canadian Tariffs.

I was greatly pleased at that short editorial on page 532 on the free food movement and its unsatisfactory results. Little use in removing tariff walls when the trade is absolutely controlled by trusts and monopolistic gangs. We have the food problem in Canada more acute than it ever was in the United States. We are here, today, the highest taxed country in the world. We occupy the pinnacle of the mountain in high cost of living. We look down upon the whole world. We are the top-notchers in paying high prices for food products. We pay $14 per head customs duty, or $70 per family, while you in the States pay but $3.50, or $17.50 per family. We positively can say that we pay 400 per cent. more direct customs tax than you do, and still you people complain. Besides this large tax, we pay an indirect tax to the protected manufacturer of $40 per head, or for a family of five, $200, as the yearly bill for Canadian manufactured goods more than under a free trade policy. Adding $70, annual customs tax, to $200, annual subsidy to Canadian manufacturers, the breadwinner for a family of five would appear to contribute $270 yearly on account of tariff barriers. I have drawn the attention of Premier Borden to your editorial, and the solution you suggest, viz: public owned abattoirs under federal control where cattle shall be slaughtered and sold.

NOT SPEEDY BUT RELIABLE. FIG. 284.

A friend in Nova Scotia has been advocating this scheme for months, but the middlemen and even the editors of the papers he was contributing to, came down on him like thousands of bricks. The "middlemen" would be completely put out of business in the meat line here in public slaughter houses under federal control, when the animals would be slaughtered and sold probably by auction to the highest bidder after the manner of a board of trade exchange. Undoubtedly this plan would reduce the price of beef in many cases one-half. In Ottawa, Saturday, dressed beef, good, sold at $11 per 100 pounds. The retail price of chuck was 18 cents, while roasts was 24 to 35 cents. The average retail price of the carcass was about 24 cents, first double the carcass price and two cents to the good. I trust that Premier Borden will give your suggestion the consideration it deserves. I stated that I thought it "criminal negligence" on the part of the government to stand pat, and not to act on this suggestion.

Ontario. J. C. MCDONALD.

CROWN GALL ON PECAN TREE. FIG. 285.

LIMESTONE CRUSHING CLUBS.

In my opinion the "community crusher" is the solution to the limestone problem. I found the lands of this county badly in need of lime, and so as soon as I had organized the farmers into clubs I took up the limestone proposition. In each of the clubs there is some member who is going to buy a crusher, and he will go around and crush the rock for the farmers in that district. They are going to charge $2 per ton for quarrying and crushing the rock, and I feel sure that they will reduce the price after this year, as I know that it is only costing them from 50 cents to $1 per ton to put the crushed limestone in the heap. Under this arrangement the farmer avoids a long haul, and I have figured that it costs about 25 cents every time a ton of crushed rock is moved one mile. In 1912 the farmers of this county used about 800 tons of limestone, and last year they used 4,000 tons. I expect there will be 10 or 12 crushers at work in the county this year, and I believe they will use at least 10,000 tons. I shall be glad to give you any further information you may desire.

GEOFFREY MORGAN.

Christian Co., Ky. Farm Demonstrator.

R. N.-Y.—The limestone crushing club will undoubtedly lead toward co-operative effort in other lines, and thus show the farmer how he may combine with his fellows.

TITLE TO MANURE ON FARM.

A owned two farms. Each farm was separated by a highway and not connected with each other. A sold one of these farms to B, and it appears that A lives on the place he owns at present but kept his cattle on the place he sold to B, in the barn, also with the understanding that B would allow him to keep his cattle on his place until the first of April, 1914. The title was closed in January and B moved on the place and took full possession. There were quite a number of loads of manure on the place that B bought, and when he was buying the place and taking title to it there was nothing said about it in any way. After B had the farm three weeks he started hauling out the manure and putting it on the farm he had bought. A came along and told him to leave this manure alone, as this was his property. He said, "If I sold you the farm I did not sell you the manure that was on the farm." However, B kept on hauling out the manure, thinking he had a perfect right to it. A called up the sheriff and had B arrested for theft. He was taken before a justice of the peace and had to pay the costs. B is a poor man—a Polander just come from New York City, and has no friends. I think he was in the right. Give me your version of this matter, as one-half of this little community of ours seems to think that B was in the right. J. K.

Connecticut.

As a general proposition, manure made upon a farm, from the consumption of its products, and in the ordinary manner, is regarded either as between the man who sells and the man who buys, or a mortgagor and mortgagee, or landlord and tenant, as part of the real property and passes with the farm, and this is generally true of both the manure itself and of compost formed of its mixture with hay, straw, soil or other substances, and whether it or they be found where the manure is dropped or gathered into heaps or piles or moved to different parts of the farm. The reason for the general rule is that since the substance of the land produces the manure, it should remain on the farm for its enrichment, and the soil should not be impoverished because of its removal by a vendor or outgoing tenant. So in this case if there was nothing said between A and B at the time the farm was sold, the manure would pass with the farm and become the property of B, and he had a right to spread it on the farm.

Of course manure may be sold from a farm by the owner or by a tenant, the same as the annual crops may be sold, and it may be the subject of contract; but where nothing is said between the vendor and vendee, the rule is as above stated with the exception of the States of New Jersey and North Carolina, where manure is held to be personal property and not a part of the realty.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Sowing Crimson Clover in Spring.

Would you advise us to seed land in early Spring with Crimson clover? We know all about its dying out in the Winter. Would you think Red-top and Timothy, or only Timothy would be the best for profit in seeding down? B. B.

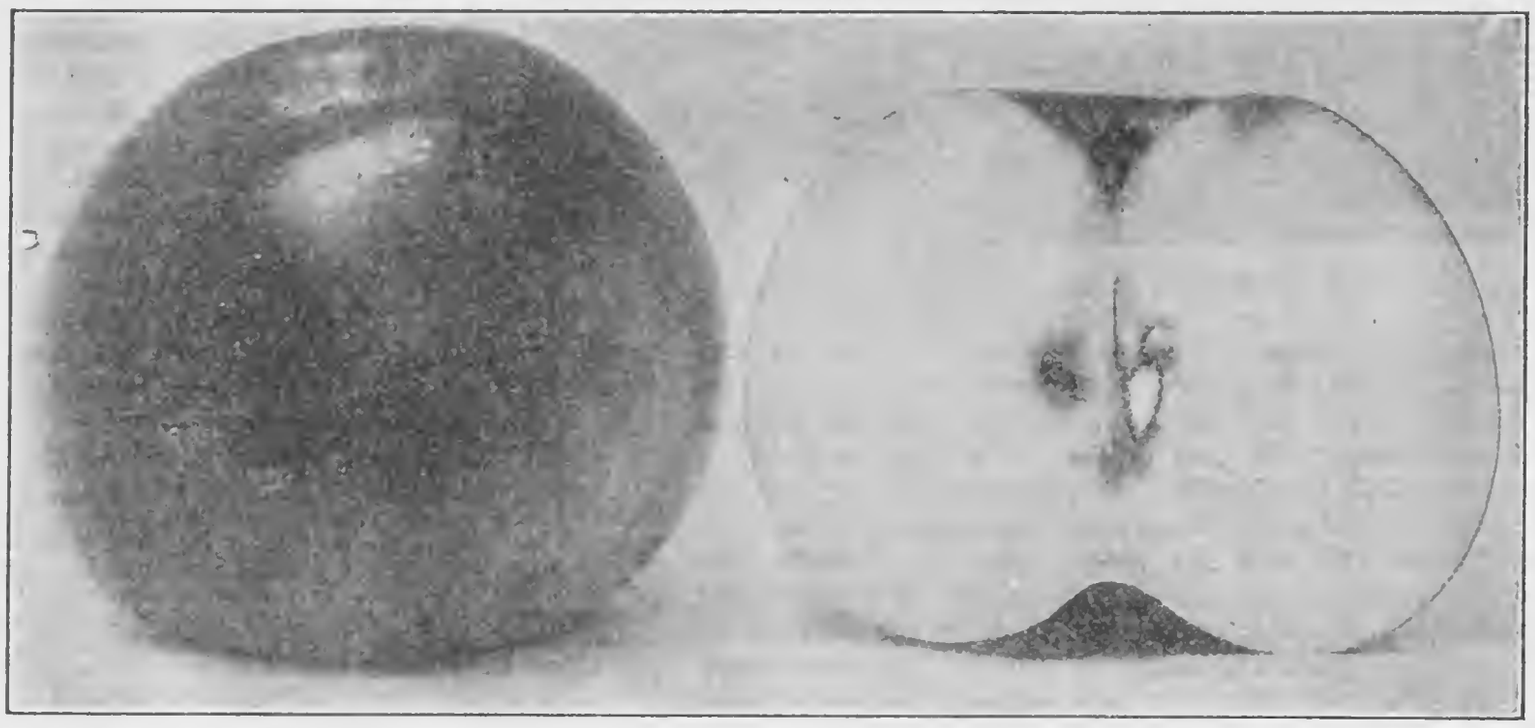
Putnam, Conn.

No. Not by any means. Crimson clover is the last thing we would seed in the Spring. It is by nature a cold weather plant and cannot endure the hot Summer sun. It is a plant for Fall seeding—to go through Fall and Winter. Alsike clover will be better for your purpose. Timothy needs an alkaline soil, which means lime. Red-top will do well on an acid soil. It is a slender grass, which grows well with the Timothy—therefore we seed them together.

The Hudson Apple.

On page 265 Mr. Wm. H. Hart of Dutchess Co., New York, tells us about the Hudson apple, which he thinks will become an excellent variety for New York growers. There have been many letters from growers regarding the Hudson, and so we print at Fig. 286 pictures of fair specimens of the apple, showing the exterior and also the core. The apple reached us out of storage in excellent condition. It is of the size shown in the picture, with firm flesh and an agreeable flavor, rather mild, and not as tart or acid as Baldwin. We judge that this will be an acquisition both from its quality and appearance, and also its ability to keep well in storage. Regarding the parentage of the Hudson, Mr. Hart now sends us the following additional note:

"Regarding the parentage of the Hudson apple, to my surprise I received a letter to-day from S. W. Underhill, the originator, who says that he grew this apple from the seed of a remarkable specimen of Newtown Pippin, which was so affected by the Spy pollen as to be plainly striped or marked with red. I had understood from Mr. Underhill years ago that he grew the Hudson from a Spy seed. I am greatly pleased to learn the true parentage, which explains much in the variety." W. H. HART.



THE HUDSON APPLE; SECTION AND SIDE VIEW. FIG. 286.

Honey Questions.

Is there such a thing as crystallized honey, and if so, how is it done? Which is the better honey, buckwheat or clover, or in other words, the dark or the light honey? E. J. A.

West Philadelphia, Pa.

Honey crystallizes naturally upon prolonged exposure to low temperatures, though the nectar from different plants seems to vary as to the length of time and degree of cold required to produce this transformation. Extracted honey crystallizes more readily also than that in the comb. If you wish to crystallize extracted honey, stir some that has already crystallized into the fluid honey and keep it in a cold place; on the other hand, if you wish to keep honey from solidifying, store it in a warm dry place. There is no difference, that I am aware of, in the wholesomeness of dark and light honey; choice between them is wholly a matter of taste. Clover, basswood, and other light-colored honeys are of more delicate flavor than that made from buckwheat and are preferred by most people; some, however, like the stronger flavor of buckwheat best and it has the advantage of being considerably cheaper in most markets. M. B. D.

Planting Vegetables.

Will you give me some information, as to growing vegetables as follows? Brussels sprouts, cauliflower, cow beets, bush beans, kale, muskmelon, watermelon.

Huntington, L. I. O. B.

In your latitude the proper time of sowing seeds of the varieties mentioned would be about as follows; Brussels sprouts should be sown in hot-bed about April 11, and treated in all respects the same as cabbage, or the sowing of seed may be deferred until May 1 to 10, and sown in the seed bed in the open ground, and transplanted to the garden soon as large enough. The first sowing of cauliflower seed should be made in the hot-bed March 1, for later use, sowings should be made in the seed bed in open ground about April 25 and May 20, transplanted to garden soon as possible. In raising plants of this vegetable care must be taken to keep them in a thrifty condition at all times; if allowed to suffer for water or food until the stems become hard and woody they will be worthless.

Mangels, (cow beets) are sown as ground is in good workable condition. Beans (bush), for a continuous supply throughout the season, should be sown first May 15, and every 15 days thereafter up to July 31.

Kale is sown in the seedbed in open ground about May 10, and transplanted to garden as soon as plants are large enough; the distance apart will depend on the variety; the dwarf sorts, two feet apart each way, the larger sorts, six inches farther apart each way. The most popular market variety is the Dwarf Curled or Dwarf German Green. This variety resembles somewhat the foliage of the rutabaga, a turnip, the leaves being a bluish green. It is grown in very large quantities South, for the markets of the North. The Dwarf Green Curled Scotch, is also largely cultivated for Winter use, and is well adapted for the gardens of our northern sections. It is very hardy and will remain over Winter in almost any place where the temperature does not go much below zero.

For muskmelons, make first planting in open ground May 15-20. A second planting may be made June 10. Plant watermelon May 20-25, or when the temperature at night does not go below 60 degrees. K.

The Mulch as Frost Protection.

I was interested in reading on page 563 Mr. Stout's experience in trying to protect his strawberries by smudging. If he had mulched he could have done it in daylight and slept peacefully at night. On Friday, Saturday and Sunday nights, May 9, 10, 11 of last year, we had very severe frosts in western Pennsylvania; Saturday and Sunday nights there being from 10 to 12 degrees of frost. It killed the strawberries and the new growths on the grapes. But one man of my acquaintance, Thomas Greenfield of Oakdale, had a good crop of strawberries. He and his hired man on Saturday afternoon, when they found it was going to be as cold as or colder than the previous night, scraped up every bit of mulching material that could be found on the place, putting it on the strawberry bed. He had enough for all except one little corner. The corner which was not mulched had no fruit last Summer, but over the remainder of the strawberry bed there was a very fair crop. The way he put it to me was: "I never made so much money in so short a time. I made three hundred dollars (for that was the price of his crop) by that one afternoon's work."

P. T. B.

Sowing Oats and Peas.

I have a sandy loam soil, somewhat run down, on which I wish to sow Canada field peas and oats. There is no manure available, but I want to spread at least 1,000 pounds of ground limestone per acre. The lime, however, cannot be delivered now. I understand the peas must be planted early and covered deep, and therefore, to gain time, would it be a good plan to sow the peas on top of ground and plow under at once, then wait till I can get the lime, possibly two weeks, work it in with the disk harrow before sowing oats which I would cover with the spike-tooth harrow? The field had corn on it last year, and is free from weeds. What is the quantity each of oats and peas usually sown per acre, to be cut for hay? T. J.

Southington, Conn.

We should not use the lime in this way after waiting two weeks. With reasonable weather these peas will have sprouted and many of the sprouts will be near the surface, and a disk harrow will chop too many of them off, and there would be trouble after this was done. Rains may set in and delay this disking, and then you will find it difficult to seed the oats. We should go ahead and put in the oats and peas together, and not use the lime unless it could be worked in when the ground is seeded. Anyway 1,000 pounds of ground limestone is too small an application to be of any particular benefit to this crop. There should be at least two tons of ground limestone, if this land is as sour as we suspect it is. Our plan would be to put in the oats nd peas without the lime. We should use some fertilizer with this crop and use the lime in larger quantity when the ground is plowed after cutting the oats and peas. The usual quantity per acre is five pecks of peas and three bushels of oats.

Wood's Seeds

Soja Beans

THE COMING FORAGE AND SOIL-IMPROVING CROP.

Farmers everywhere are enthusiastic in their praise. Contains more oil, milk and fat-producing qualities than any other forage crop; at the same, are one of the surest-cropping and largest-yielding crops grown.

Wood's 1914 Descriptive Catalog gives full descriptions and information about all the best varieties of

Soja Beans, Cow Peas, Velvet Beans, Sorghums, Ensilage Corn, Millets, and all other Seasonable Seeds.

Write for **Wood's Descriptive Catalog** and prices of any seeds in which you are interested.

Plants MUST Have Nitrogen!

It is the necessary food for Clover, Alfalfa, Peas, Beans—any legume. Where can they get it if previous crops have exhausted the supply in the soil or if the soil is naturally poor? you must STOCK YOUR SOIL WITH NITROGEN—not by costly commercial fertilizers but by means of

Ferguson's NITROGEN BACTERIA

With $2. worth you can do the work of $10. worth of commercial fertilizer. The Bacteria, gathering the Nitrogen from the air itself, store up on the roots of your crops more than they can use, producing bigger, better crops and leaving the surplus to enrich the soil for feature seasons!

Let us tell you how Ferguson's Bacteria will pay you. A postal card will bring our special booklet N, and full explanations, at no cost to you. Bacteria for ¼-acre, 50c; for one acre, $2; for five acres, $9. A big opportunity for agents, under our liberal arrangement.

HOMEWOOD NITROGEN COMPANY, 51 Liberty Street, New York City

Alfalfa Plant on left Inoculated with Ferguson's Bacteria; on the right, not Inoculated. From Gov. Bulletin No. 159

The Home Acre.

Rye Before Berries.

I have a piece of ground sown to rye last Fall on which I intend to plant raspberries and strawberries this Spring. I would like to allow the rye time to grow before turning it under. When should this ground be plowed and what is the best method of fitting such a field for the small fruits? Would an application of lime be a benefit to the raspberries? F. T. J.

You could delay planting the raspberries and strawberries if you take care of the plant properly. If you are to do this, unpack the plants promptly when they come and put them close together in drills. Strawberries may be put one inch apart and the raspberries two inches, cutting the latter back severely and seeing that the roots are covered. Water them from time to time if need be. As the rye is coming into bloom, plow it in and immediately pack down hard with a roller or heavy drag. Then fit the ground thoroughly and set out the plants, taking them from the drills a few at a time. The strawberries do not require lime. Raspberries do not respond to lime freely, but after plowing under this rye, the soil may be too sour, so that an application of limestone immediately after plowing would pay.

Notes From A Maryland Garden.

Our calendar seems to have slipped a cog. Winter did not begin till February, but once started it has held the stage, and here after the middle of April still gives us chilly mornings. I have been in the habit of planting my earliest roasting ear corn in March, but it was well into April before it was done this year. By the 20th of April I usually think about getting the early tomato plants from the frames into the garden. This year they will probably stay in the frame till May. The early peas which should be blooming now are only two or three inches above the ground, and the sweet peas that were planted in January, are but just now showing above ground. Spinach has wintered well, but has made a slow Spring growth, and the late Spring crop of lettuce, with which we generally wind up the lettuce season in May, looks as though it may be June before we get the heads.

I planted in the Fall of 1912 a lot of the so-called Dutch Roman hyacinths; really small bulbs of the regular Dutch hyacinths. They gave me a fine bloom last Spring and I ripened the bulbs, which had greatly increased in size, and replanted them last Fall. Now the bed is very showy, and the spikes are fully as large as those of the regular Dutch bulbs. I believe that it would be a good plan to import the small size bulbs and grow them one season here.

The first planting of Gladiolus corms was made the first week in April. But I do not plant all at once, but keep back some for a succession. Planted in groups among the shrubbery border plants the flowers have a better effect than standing alone.

A new tomato of any promise is always a temptation to me. Of course I do not depend on the new ones, but always try one or two novelties. This year I invested a dollar in a paper of the new John Baer, which is claimed to be the earliest and best ever. The seed certainly germinated well and I have a superabundance of plants, and hope for a new sensation.

While as a rule I do not think that it pays a gardener to save vegetable seed, there are occasional plants where it can be done to advantage. For several years I bought potted plants of eggplants from the Northern growers, and every season had diseased plants. I then bought seed of the Black Beauty, selected a fruit on one of the best plants and let it ripen, and got an abundance of seed from the one fruit, and have never had any more disease in my eggplants. But, while one can put tomato plants out in the cold frames and harden them off, I have never found this any advantage to the eggplant. I set the small plants in thumb pots in the greenhouse, shift to threes and then to fours, and get plants with leaves larger than my hand before setting them out, and never set them before the last of May. The soil is then so warm that they grow right off. A chilled eggplant takes a long time to recover.

Aside from the green onions, which we have been eating a month, the first fruits from outside in the garden was rhubarb; could have had this earlier had I used my old method of turning barrels over the hills and banking around with hot manure. But this was neglected at the right time, and we get only the natural growth. One Spring job in the rhubarb bed is the cutting out of the bloom heads that persist in trying to get up. We want all the growth in the leaf stalks, and cut out every bloom head that shows before it has time to open flowers, for we are growing rhubarb for the leaf stalks. W. F. MASSEY.

Maryland.

Late Planted Telephone Peas.

In "Brevities" you ask if anyone can report on planting mixed peas for a long continued crop. I have the long continued crop all right, but do not plant mixed peas. I use the Telephone, which planted first of July will bear continuously till killed by frost. If planted in April or May the vines die, but planted in July three or four inches deep they remain green till killed. In 1913 I had green peas into November, and when they were killed by frost there were peas in all stages from ripe peas to blossoms. E. E. S.

Skowhegan, Me.

Growing a Crop of Mulch.

I have been a small fruit grower for many years, and have made great success mulching with straw. Straw mulch saves lots of hard work; it keeps the weeds down, holds the moisture and keeps the fruits clean. With me straw is scarce, hard to find, and I have to look for some other mulch that will take the place of straw. What do you advise in its place? Small fruit growing without a mulch of some kind is a failure with a slow man behind this business, but mulch is what produces big crops in Maine. A. A. E.

Maine.

This problem is troubling many strawberry growers. Small fruit growing is coming into localities where little grain is grown. This makes a shortage of straw, and the grower can hardly afford to buy baled straw for his purpose. Usually some late planted crop is most economical. There are few crops better for this purpose than Japanese millet. A thick seeding of this millet on rich ground will give a heavy crop of coarse material, which when cut just before the seed forms will make a very good mulch. Another good mulching crop is sorghum, or ordinary field corn, broadcast thickly on rich ground late in the season. Both the millet and the sorghum can in an ordinary season be seeded on an old strawberry bed. After picking the old bed is plowed under, and the ground fitted. The millet or sorghum seeded after such a bed will have time to develop a good crop, and cut just before frost will make good mulching material quite free from weed seed. The millet or corn stubble may then be plowed, and seeded to rye if desired. Another plan followed somewhat in a wet season, is to sow barley alone, or barley and oats together, right among the strawberries in early September, after cleaning the beds up. This grain makes a thick growth during the Fall, and in Winter mats down over the berries, providing a partial mulch, and saving considerable mulch material in that way.

Corn Ear-worm.

The Kansas Experiment Station rightly states that the corn worm causes a loss of millions of dollers:

"The corn ear-worm is destructive to the sorghums, Alfalfa, cow peas, and tomatoes, as well as corn. It is able to fly long distances, and is therefore a serious pest to control. No method has been found to eliminate entirely the damage done by the ear-worm, but the individual farmer can greatly reduce the injury to his crop by planting a thoroughly prepared seed bed as early as it is possible to do so, and avoid a set-back from cold weather."

In New Jersey experiments have been made in dusting a dry poison like powdered arsenate of lead on the corn as the ears form. Machines are made for the purpose, and some very good results are reported.

Buy From The House That Pays The FREIGHT

On Almost Everything for the Farm, Home and Shop

HERE is good news for Mail Order buyers! **No Freight to Pay.** Think of the money that will save you! Nothing to pay when goods arrive. Now you can tell to a cent just what anything you buy will cost laid down at your own R. R. Station. No other Mail Order House gives you this great advantage. No other Big Mail Order House Pays The Freight.

We Pay the Freight

On all shipments of 100 pounds or more to any point in the followin States (excepting on vehicles and farm implements).

New York, Pennsylvania, Ohio, Virginia, West Virginia, Maryland, Delaware, New Jersey, Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island.

We deliver free in these Sates all Furniture, Crockery, Stoves, Fencing, Roofing, Wall Paper, Paint, Cream Separators, Harness, Gasoline Engines, Dry Goods, Clothing, Shoes, Millinery, etc., etc.

If you live anywhere outside the States named above **we will pay all delivery charges** on Dry Goods, Millinery, Wearing Apparel, Shoes and Jewelry and **a liberal partof the freight charges** on everything else excepting vehicles and farm implements. So no matter where you live you can enjoy this new Freight Paid advantage in part, if not all.

Write for This Big CATALOG FREE

No matter how many other mail order catalogs you have be sure to send for this one. It is the only big Mail Order book that **quotes freight paid prices.** When you get it, compare our free delivery prices with others. You will be surprised at the money you can save. Send foe the Free Freight Paid Book today. A postal brings it.

TILE DRAINED LAND IS MORE PRODUCTIVE

ROUND TILE

Earliest and easiest worked. Carries off surplus water; admits air to the soil. Increases the value. Acres of swampy land reclaimed and made fertile. **Jackson's Round Drain Tile** meets every requirement. We also make Sewer Pipe, Red and Fire Brick, Chimney Tops, Encaustic Side Walk Tile, etc. Write for what you want and prices. JOHN H. JACKSON, 89 Third Ave., Albany, N Y.

Get Stumps Out With Less Work

"An explosive reduces the labor of clearing land to minimum," says Minnesota Farmers' Bulletin 134. "It may be used by any intelligent man." Pulling stumps requires costly labor and machinery. You can get out stumps of any size, roots and all, and break them into pieces easily handled, by using

Atlas Farm Powder

THE SAFEST EXPLOSIVE

Atlas Farm Powder is made especially for farm use. It is easy to use—no experience needed. Just bore a hole, light a fuse, and work that would take hours or days is done instantly! There is an Atlas dealer near, to book your order.

You can make more money from your land by using Atlas Farm Powder to blast out stumps and boulders, break up hardpan in unproductive fields, do ditching, and dig holes for trees or posts. It is the cheapest farm hand.

Send Coupon for "Better Farming" Book—FREE

Our big new book, "Better Farming," tells how to improve the fertility of the soil, how to grow bigger crops, redeem waste land, improve orchards, etc., with Atlas Farm Powder. Valuable to every land owner. Sent free for the coupon—mail it before you forget it.

EVENTS OF THE WEEK.

DOMESTIC.—Fire swept the plant of the Federal Steel Company and the Harris Chemical Company on the Delaware River front at Chester, Pa., April 26, causing a loss of $500,000. Six fireman were injured, two seriously.

The plants of the Atlantic Fertilizer Company and the United States Fertilizer Company were destroyed at Baltimore, April 26, by fire, with a loss estimated at $1,350,000. The fire is thought to have originated from spontaneous combustion in the condensing chamber of the Atlantic plant.

Fighting in Fremont County, Col., between striking miners and militia, continued April 26-28, seven men being killed near Canyon City, April 28. President Wilson invoked his constitutional authority and intervened in the domestic affairs of Colorado by ordering Federal troops there to stop the warfare between mine operators and miners. In a proclamation issued from the White House he commanded all seditionists and disturbers to disperse by April 30. Governor Elias M. Ammons, of Colorado, issued a proclamation declaring the State to be in insurrection and practically declaring martial law. Fifteen more men were killed, April 29, in two battles in the Colorado strike district. One battle was fought at Forbes, near Trinidad, and the other at Walsenburg, where the fighting had already been continuous for 48 hours. Many wounded were carried away. The total casualties since the strike was began on April 20 are estimated at 47 killed and 44 wounded. At the inquest into the burning of the tent colony at Ludlow witnesses testified that militiamen set fire to the tents, which caused the terrible loss of life there, and that they fired continually at the Ranch House, where the refugees were huddled for safety.

Harry Etchells, once head steward of the White Star Line, recovered a verdict for $18,000 in the Supreme Court, April 24, from the Wells Fargo Express Company. He lost a leg when a truck owned by the company scraped him off a sidewalk and under the wheels.

Four miners are known to be dead, 59 were rescued, 38 of them severely burned and 172 others were entombed in two burning mines near Ecles, W. Va., April 28, as the result of an explosion of gas in mines Nos. 5 and 6 of the New River Collieries Company.

During a furious gale on the Great Lakes, April 28, the steamer Benjamin Noble, her crew of twenty or more and a large cargo of railroad iron were swallowed in the waters of Lake Superior off Duluth. All efforts to find the hulk of the steamer have proved fruitless. Four bodies have been recovered. The general belief is that the vessel missed the Duluth entrance and struck the Point and foundered in deep water. In addition to the high seas there was a heavy snow, and the Duluth entry light was out. The steamer was making the first trip of the season. Several other wrecks were reported.

MEXICO.—The United States accepted offer of Brazil, Argentina and Chili to act as mediators between this government and Mexico "in the conflict between the United States and Mexico." The first step of the mediators, according to the diplomatic authorities, will consist of a request of the United States for a definition of that "reparation" which it has been led to demand as essential to the preservation of the dignity of the United States. Huerta formally accepted the offer of mediation April 27. The mediators are moving now to obtain an agreement between Huerta and Carranza for the suspension of internal strife in Mexico while efforts are being made for a peaceful solution of the present crisis. The receipt of Huerta's reply followed close upon the disclosure in Washington of the fact that England, France and Germany have been exercising great pressure upon him to consent to a peaceful settlement of the present difficulties. * * * The Administration feels confident that the taking of Vera Cruz has seriously crippled Huerta. It believes that by depriving him of the customs collected at that port, which it estimates at 3,000,000 pesos, or $1,500,000 a month, which is 40 per cent. of the total customs revenue of the republic, it has achieved a giant stride toward his elimination. These receipts are now being segregated but no part of them is reaching the Huerta government. * * * More than 2,600 destitute refugees from Mexico were at Galveston, April 26. Three trainloads of Americans held at Mexico City, and 113 American farmers and their families held at Soledad, were brought away by Commander Tweedie of the British cruiser Essex, who went to the capital accompanied by his orderly and interpreter, and used such moral force upon Huerta that the captives were permitted to go.

FARM AND GARDEN.—At a recent meeting of the Agricultural Council of Cornell University two appointments were made to the staff in the Department of Floriculture. These were the appointment of David Lumsden of the New Hampshire College of Agriculture as assistant professor of floriculture, and Clark L. Thayer of the Massachusetts Agricultural College as assistant in investigation.

The Western Seedsmen's Association held its thirteenth annual meeting at Omaha, Neb., April 20. The following officers were re-elected: H. A. Johns, Sioux City, Ia., president; C. C. Massie, Minneapolis, Minn., vice-president; Henry Winheim, Omaha, Neb., treasurer; Mel L. Webster, Independence, Ia., secretary. L. L. May, H. A. Johns and C. C. Massie were made members of the grievance committee.

Reorganization of the work of the Department of Agriculture was proposed in an amendment to the agricultural appropriation bill reported to the Senate at Washington, April 17, by the agricultural committee. The committee made a half-million-dollar increase in the house bill. Under the amendment the Secretary would be instructed to submit a plan for a complete reorganization of the Department to Congress and to prepare his estimates for the fiscal year 1916 along the lines of the recommended plan. The committee struck from the bill the appropriation for Congressional distribution of free seeds.

As the result of an outbreak of rabies in the vicinity the State Department of Agriculture has established a quarantine on all dogs at Newburgh, N. Y.

COMING FARMERS' MEETINGS.

American Association of Nurserymen, Cleveland, O., June 24-26.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5-6.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

BOSTON MARKET REVIEW.

The supply of fruits in the market is none too heavy for the demand, and prices are steady or inclined upward on several things, including oranges and grapefruit. The former are nearly 50 cents per crate higher than a week ago, as Floridas are about done, and higher prices in other markets on Califoruia fruit, decreases the supply sent here which naturally stiffens prices here. Floridas bring up to $4.50 per box, and Californias up to $3.50 for navels and up to $2.50 per small box for tangerines and bloods. Florida grapefruit $3.50 to $4.50 per box; Cuban $3 to $3.75; California stock about $2.75. Good apples are also in the high-price class, bringing up to $7 per barrel for best Baldwins, with good going at $5 to $6. Russets bring $3.50 to $5 per barrel; common box fruit goes at $2 or better per box. Western box stock of good quality brings $4 to $4.50 for Winter Banana and Delicious, and about $2.50 to $3.50 for other kinds. Cranberries bring the nice figure of $15 and better per barrel. Strawberries offered are rather poor in quality, and prices correspond; fruit from Florida and Louisiana 20 to 30 cents per box. Lemons are fairly plenty and prices range from $2.50 to $4.25. California stock brings the higher figure. Bananas iu fair supply and prices reasonable. Extras bring $3.25 per bunch, good to medium bunches, fair sized fruit, go at from $2 to $2.75, and small bnnches $1 to $1.50 for yellows with reds at 50 cents to $1 per bunch higher. Pineapples are plentiful and will continue so for some time, and prices, which are reasonable to buyer, are apt to be more so; for the past few days $2.50 to $3 per crate was about the price paid.

The few Hubbard squash left bring up to $1.20 per ton; some claim to have receive even better this last week. Hothouse tomatoes are decliniug, and best prices now are 40 cents per pound, with Florida stock at $3 and $3.50 per crate of six baskets. Good lettuce sells very well at $1 per box, some not so good at 50 to 75 cents per box. Other greeu stuff is increasing in supply, and prices are dropping, cucumbers selling at $5 per box for No. 1, others $2.50 to $4. Southern spinach bring $1 per barrel; kale about the same or less. Native dandelions 50 to 65 cents per box; beet greens the same; bunch beets $1.75 per dozen; bunch carrots $1.25 per dozen; old beets, per box, $2; old carrots $1.50; parsnips $1.50 per box; bunch radish $2 per box; Southern string and wax beans $3 per basket. New Florida cabbage $2.50 per crate; old native stock has sold hard and slow, many going at $1 per barrel; a few at $1.50 if extra good. California and Southern asparagus $2.50 to $4 per dozen bunches; celery up to $2 per dozen bunches. Onions and potatoes both are stiffer in price, owing to small receipts, chiefly. Native, Conn., and New York stock now brings about $3 per 100-pound bag; foreign stock $3.50 and $4 per crate. Maine potatoes now bring $2 per bag of two bushels at the yards, or 10 cents per bag higher at wholesale houses. Many are still going south, as the southern crop is late this season owing to adverse weather conditions. Some claim 25 per cent. of the last crop is still in growers' hands and being held for higher prices. Sweets bring $1 per basket.

Eggs are slightly higher, as fewer are being received and some are putting into cold storage for the late Summer trade; the prices paid for these are said to be 20 and 22 cents per dozen. Fancy fresh eggs bring 25 and 27; others of good quality 24 and 25 cents for eastern stock; Western eggs 22 to 24. Many are being used for hatching, as young chicks are in demand at 15 cents and better each, the supply in some cases not being enough to keep up with orders.

Butter is easy, best quality not too plenty, but other grades plentiful to make it up. Best New England stock 26 to 29 cents in box and tubs; best western 26½; good, 24 and 25; cheap grades 23 and 24. Cheese just in fair supply, with no surplus; prices range from 14 to 16 for good to 17 and 20 for best.

Live poultry is in just fair demand, with prices on hens in good condition, ranging up to 19 cents per pound; others 15 and 16 with roosters down to 12. Dressed stock of fowls 18 to 21; turkeys 25 and 27.

Beef is about the same in range of price and supply; best 12 to 14; good 9 to 11; poor grades eight to 10. Live beef ranges from $3.50 to $5.50 for poor or medium grades up to $8.50 for best at Brighton. Live hogs around nine cents per pound; dressed about two cents per pound higher. Live sheep and lambs 4 to 8; dressed 10 to 14; live veals 7½ to 10; dressed 11 to 16. Cow and steer hides 13 and 14 cents per pound; calfskins 22.

Horse trade is slowing down some in demand, but prices are holding about the same as the past few weeks, but as the supply is plenty of medium and light weight common stock, prices are apt to be in buyers favor on these if they hold off a while. Heavy high-grade horses, however, are short and high. There seems to be an extra demand for farm horses this Spring, the reason for which is that prices have been for the past few years steadily increasing, and many have put off buying one year on account of thinking the limit had been reached, and next season would see a decline, and so the old team was used until one or both perhaps died and a purchase had to be made now to replace these. Some have turned to oxen, which are also way up in price for various reasons, short supply, big demand and high price of beef, being chief reasons. A light young pair readily brings $200 and hard to get at that; good teams bring $300 and better. I believe it will pay many to raise at these prices, and to prove our belief in same, are starting a good promising pair this Spring. A. E. P.

April 22. Prices at auction for good heavy draught horses $175 to $225. Cows from $75 to $125; heifers, one year old, $40 to $50; hogs $9 per cwt; pigs $3 to $4; fowls, old, 15; young 25. Eggs 16; butter 30; lard 13 to 15. Corn, per barrel three bushel in ears, $1.10. Hay $15; potatoes 85. No fruit on market, as last year we did not have any. Prospects look good so far; peaches in full bloom and spraying is over. Graiu and grass is looking fine. Farmers are a little behind on account of cold and wet weather; have not done sowing oats and planting early potatoes yet. Labor, per day, $1.50 for 10 hours' work on public work; on farm $1.25. L. E. B.

Beaver Creek, Md.

Cattle often sell for more at home than at Pittsburgh stock yards, because butcher would have freight from yard. Potatoes are quoted at 75 and 80; but home-grown are retailing from $1 to $1.25. Elgin butter retails at 29 in city, but farmers who attend market every week were selling at 35 to 40. Eggs were selling about two cents above mark, but in two or three weeks will be 10 to 15 cents above mark, as the people say all eggs are good this time of year. Chickens, if young, are far above; 2½ to three pounds nicely dressed $1; two to five pounds $1.25 to $1.50 each; old hens 25 cents per pound. Good young horses, 1,500 pounds, $500 to $700 per pair, nearly all teams are brought from the West. Our turkeys averaged 40 cents per pound Christmas and New Year, but commission men quoted good 28 to 30, so you will see that the paper quotes price, but there are plenty of people who want something fresh from the country and are willing to pay good prices for it. G. V. L.

Eighty Four, Pa.

We are at present getting 36 cents for dairy bntter, but some is selling as low as 28 cents. Milk is $1.50 per cwt. at cooling station. Calves nine cents per pound, live; fat cattle eight to nine cents, live weight; fat hogs 12, dressed weight; eggs 16; home-cured ham 20. Wheat $1; oats 50; corn 75. J. Y. H.

Elverson, Pa.

Potatoes, wholesale, 90; potatoes, retail, $1.15; corn, wholesale, 70; corn, retail, 85; oats, retail, 60; wheat, wholesale, 90; butter, retail, 36; pork, wholesale, 13; lard, retail 16; eggs, retail, 20 to 25; hay $20; fodder 2½ cents a bundle; fruits scarce. HOME SAFETY against Lightning, Fire and Storm

Lightning causes 75% of roof fires but it never damaged a roof covered with

Kanneberg Metal Shingles

"We Pay the Freight"

They are proof against fire, rain, snow, heat and cold. Need no repairs, because they will not rot, rust, crack, buckle, curl nor fall off. Can be laid on low pitch roofs and always look well. Give clean cistern water. You can save big money by using this almost indestructible roofing. Buy direct from the factory. Put it on yourself easier and quicker than wood shingles.

Send for our catalog and rock bottom prices before you buy any roofing. Kanneberg Shingles make the cheapest roof you can buy, judged by service, the real test. Come in single shingles, 8 to a sheet, or in clusters 2 feet by any length from 5 to 10 feet. Many designs and sizes. Write for catalog today. Be sure to give *dimensions of your roof* and we'll tell you how to get the best roof at lowest cost.

Leaky Tank.

W. H. M., page 447, is bothered with leaky water storage tank. Draw all water from tank and cover inside, including bottom, with metal lath or one-inch mesh poultry wire, using plug or piece of pipe to preserve opening for pipe, and plaster with three coats of cement plaster, using some hair in first coat, applying succeeding coats just as preceding one is drying. Make first and second coats rough to hold next coat better. Take one part good lime paste, three parts sand and mix thoroughly into heavy mortar; then add two parts cement with water to "temper" and apply. For first coat add hair, moistened, to lime and sand and have thoroughly worked into mixture. After dry the surface may be coated with some of the waterproofing compounds that may help make waterproof. Alum is recommended mixed with the cement. It must be remembered that cement is not waterproof, and when wet beyond saturation will filter some moisture. To make it waterproof it must have some impervious coating. But W. H. M. will find if he follows above directions he will have only an occasional drop, here and there. Fasten wire or lath securely and do not try to make the wire, if wire be used, lie too snug to staves—leave room for plaster to clinch. I have an outdoor water tank so treated, and will give a stave silo a similar lining—I believe the cheapest way to build a first-class silo. W. F. M.

Pennsylvania.

Waterproofing a Cellar.

Regarding the inquiry of A. S., on page 447, relating to waterproofing a cellar, I will say, that the sure way would be to mop over the present concrete floor with pitch, and up the wall as high as water would come in. Then lay down a thickness of tarred paper all over the cellar bottom and mop this over with pitch, as in the beginning. Then add another covering of paper and another coating of pitch. This is same as first covering for tar and gravel roof. Above this, put about two inches of concrete. If the cellar has water in it, continuously, a depression must be made, either outside the cellar or inside, at the lowest point, and the water kept pumped out until the cement is laid. I understand there are preparations made, which the manufacturers guarantee, that consist of material ground so fine that by applying it to concrete, it fills the pores so tight that water is kept out. With this I have had no experience, however.

Maine. J. H. R.

Cement Will Renew the Pails.

There are a thousand and one ways in which cement may be applied on the farm. Here is one of the simple ways which makes a sack of cement more than pay its way. A lot of us have pails which have been used either in the milk-yard or watering stock, which are useless because of holes in the bottom. Some of these may be too near the scrap heap for repair, yet by mixing a little cement and spreading it over the bottom of the pail, its life will be continued this season at least. The pail would make a good one in which to feed calves, and for such purposes as an old pail is used about the house and barn. The pail may seem a little heavier, but the use of the cement will pay. WALTER JACK.

Engine for Pumping from Well.

My two horse power kerosene engine is speeded to 650 revolutions per minute, equipped with six-inch drive pulley. I wish to belt to 16-foot line shaft and operate pump-jack, that is equipped with 12-inch pulley and geared five to one, the stroke being six, eight or 10-inch. The well is 158 feet deep and I believe 50 strokes per minute would be fast enough to run the pump. Will you advise what size pulleys to use on line shaft to operate pump at this speed?

New York. R. W. A.

The particular sizes of the pulleys you use on the countershaft must depend upon what you can get readily. As I understand it, you wish the 12-inch pulley on your pump-jack to run at 250 revolutions per minute. Then the pulleys on the countershaft would bear the ratio to each other of 650 to 250, if the engine pulley were the same size as the pump jack pulley. It is half the size, however, so the pulleys on the countershaft would be in the ratio of one-half that given, or 650 divided by 250 times one-half, which equals 13 divided by 10. The pulleys may be in this ratio, that is, one 13 inches in diameter and the other one 10 inches, or one 6½ inches and the other five or any other combination having the ratio of 13 to 10. The larger one of the two should be belted up to the engine.

Let us see how this works out. The belt running from the engine to the countershaft pulley is an endless belt. Therefore every part of it travels the same distance in the same period of time. A point on the engine pulley in one minute would travel around the circumference of the six-inch pulley 650 times. It would go, therefore, 650x6x3.1416 inches. A point on the counter shaft pulley must go the same distance but we know it will go SxDx3.1416 inches where S is the speed of the countershaft and D is the diameter of that pulley. So 650x6x3.1416 equals SxDx3.1416 and as the constant cancels out 650x6 divided by D equals S. By using the same argument in considering the belt from countershaft to pump, we find that 250x12x3.1416 equals Sxdx3.1416 where S is the speed of the countershaft and d is the diameter of the second pulley on the shaft. From this we find, by cancelling the constant, that 250x12 divided by d equals S. And in both of the cases S, the speed of the countershaft is the same so we can say that 650x6 divided by D equals 250x12 divided by d. Therefore,

$$\frac{3900}{D} = \frac{3000}{d} \text{ or } \frac{d}{D} = \frac{3000}{3906} = \frac{10}{13}$$

The smaller you make the pulleys, the faster the countershaft will rotate. I should recommend the 10 and 13-inch size, although they will cost more than the five and 6½-inch size. The difference will not be great. R. P. C.

Cement for Steps and Walls.

How can I figure out the quantities of sand, gravel and cement, required in making walks, steps, walls, etc.? The mixture would be six to one. The walks would be a three-inch base with one-inch top of two in one. The steps would be seven inches riser, eight inches tread, six inches stringer and would have a finish one inch thick of two in one.

No. Adams, Mass. G. W. J.

By a one to six mixture I presume you mean one part of cement, two parts of sand and four parts of gravel. This is called by concrete workers a one-two-four mixture. With these proportions, two bags of cement, 3½ cubic feet of sand, and seven cubic feet of gravel when mixed together will make eight cubic feet of concrete finished. I think this is altogether too good a mixture to use for the purposes you mention. I would suggest that you use a mixture of one part cement, 2½ parts sand and five parts gravel. With this mixture two bags of cement, 4⅜ cubic feet of sand and 8¾ cubic feet of gravel will make 10 cubic feet of concrete. The sand and gravel are always measured by volume. Any kind of a box will do as long as you know the contents in cubic feet. It would be best to make a box without a bottom and just large enough so that if it is laid on a mixing board and filled with sand level full once, you will have enough sand to mix with two bags of cement, while if filled with stone twice, you will have the proper amount of stone. Such a box for the last given mixture would contain 4⅜ cubic feet, so it could well be one foot deep, 21 inches wide, and 30 inches long. Shovel the box full, level it off without ramming or packing the contents, lift the box and you have the proper proportions. For the finishing or wearing course, the mixture can be one bag of cement to two cubic feet of sand or, to use the same box as above, mark off one inch down from the top on the inside, a line all around the box. Fill with sand up to this line and you will have about four cubic feet. Mix this amount with two bags of cement. The resulting mortar will have a bulk of about 4½ cubic feet.

The exact proportioning of materials and the volume of the resulting concrete or mortar has been the subject of prolonged controversy. As a result there are two reasonably good formulas for determining the amount of sand or gravel in a cubic yard of concrete.

Barrels of cement per cubic yard of concrete equals,

$$\frac{6.75}{\text{Parts of gravel to one part cement}}$$

Cubic feet of sand per cu. yd. concrete equals $27 \times \frac{\text{Parts sand to 1 part of cement}}{\text{Parts gravel to 1 part of cement}}$

These are very nearly in accordance with the calculations made by experts. For example, let us apply it to a 1-2 ½-5 mixture. There would be

$\frac{6.75}{5}$ or 1.35 barrels of cement, and

$27 \times \frac{2\frac{1}{2}}{5}$ or 13.5 cubic feet of sand and

2x13.5 or 27 cubic feet of gravel

in one cubic yard of concrete. These amounts are obviously too large by about 12 per cent. If we take 88 per cent. of the totals given, we will get much nearer the truth. That will give us 1.2 barrels of cement, 12 cubic feet of sand, and 24 cubic feet of gravel.

The above formulas are the best of the lot given and are the simplest but the results are, as shown, too large, so apply them with care, taking for most mixtures, about 88 per cent. of the total given. R. P. C.

Mrs. Smith was engaging a new servant, and sat facing the latest applicant. "I hope," said she, "that you had no angry words with your last mistress before leaving." "Oh, dear, mum; none whatever," the prospective maid replied, with a toss of her head. "While she was having her bath, I just locked the bathroom door, took all my things, and went away as quietly as possible."—Youth's Companion.

CBFR LIGHTNING ROD

The Standard of Protection Since 1849

Anyone familiar with the frightful destructiveness of lightning realizes the wisdom of securing *positive* protection.

Each year the loss of *life* by lightning runs into the hundreds; and millions of dollars damage is done to property. In 1849—65 years ago, the first

Cole Bros. Franklin Rod

was put up. From that day to this *not one penny's* damage has been done by lightning to any building properly equipped with a C B F R Rod.

Here is a **record** that should guide you in your purchase of lightning protection. Not claims, but positive **proof.** The C B F R rod is the genuine Benjamin Franklin rod, perfected by the oldest and largest rod manufacturers in the world, and guaranteed by them to wear and give perfect protection. Flimsy substitutes **cannot** offer you equal protection and equal wear.

FREE!

Here are inside facts about lightning rods, never before published. A complete, reliable treatise on the subject, brimful of illustrations in two colors. 20 pages, 9 inches by four. Don't be in the dark when you are approached about lightning rods; know what arguments are sound and what are false. Our free book tells you. Get it today. One copy free to property owners—extra copies 4c each. Write!

HUSSEY PLOW CO., Box R North Berwick, Maine

THE EARLY FRUIT SITUATION.

Genesee Co., N. Y., will have an immense crop of apples the coming season, the prospect for the largest yield in several years is good. Most of the farmers claim that Baldwins promise the best, with Greenings and Kings not far behind. A. S. Davis, an authority on fruit throughout the county, stated, April 22, that unless there are frosts between now and May 30th, "this will be the biggest apple year we have seen since 1896." That year was such a phenomenal one that there was a saying that hitching posts had apples on them. J. C.

April 24. Not one per cent. of peach buds came through Winter. Pears are fine; cherries fine; plums good, frequently irregular. Too early for telling; some apples, but many show fine where they did not bear last year. Too early for quince. Strawberries very short, due to lack of growth during dry season last Summer. As a whole prospects are for between "good" and "fine" aside from peaches. F. L. E.
Athens, Pa.

April 25. We are in the cold zone of Western New York. No blossoms yet. While the Winter was long and cold I do not think the buds of apple, pear, plum and cherry are damaged. We had a blanket of snow that was a great protection. We cannot grow peaches successfully. I have orchard heaters and oil for heating about eight acres of cherries. My experience with heaters for two seasons has been quite favorable. D. C. H.
Hornell, N. Y.

April 24. We are having a very cold backward Spring in this section, and practically everything is perfectly dormant yet. Peach buds are unquestionably destroyed, or practically so. The trees went into the Winter in poor shape, owing to the late warm Fall, and this is also true of other tree fruits and small fruits, although they seem to be in fair shape, and think there is a fair prospect for fruit of everything outside of peach. The cool weather has kept everything dormant, so far, and nothing should suffer from Spring frosts.
THE STORRS & HARRISON CO.
Lake Co., O.

April 24. I have not made a personal examination of the peach buds, but it is generally considered that the buds are nearly all killed. Prospects are good for apples. Grapes are raised quite extensively and buds and wood in good condition. Farm work of all kinds is very backward. I. C.
Penn Yan, N. Y.

April 24. Peaches have been reported entirely killed three times this Winter by all but Jay Allis, who has said all the time he had some. Now he says he has enough for a good crop, as many as last year. Apples, pears, cherries, etc., all promise a full crop. I do not look for a big crop of peaches, and if those who still say "no crop" do not have some, it will be a light crop. I am changing my system of storage over into ammonia. Will raise 30 acres bush limas for canning. Wheat, grass and Alfalfa all look well. C. A.
Medina, N. Y.

April 26. This year even good old Lake Ontario could not save our peach buds. There is very little left beside Carman and Champion. The warm weather last Fall had started the buds, and for this reason they were not able to stand the extreme cold. As to apples there is great promise now for a big crop. Some are predicting the biggest crop since 1906, and have even set the price at $2 per barrel to the grower for first-class fruit. It seems rather early to make any predictions, for it has been my experience that in four years ont of five the determining factor in the size of the crop has been the condition of the weather during blooming time. Long continued cold wet weather or hot muggy, rainy days mean serious damage. I understand that apples and cherries are in full bloom in Southern Illinois, and are very far advanced in Michigan and other Central States. This early blooming increases the danger of damage to the apple crop. F. W. CORNWALL.
Wayne Co., N. Y.

Sixty to 80 per cent. of peach buds killed—enough live buds for a light crop under continued favorable conditions. Apples promise an abundant crop. Season very late and but little of "dormant" spray applied as yet (Apr. 26).
Wayne Co., N. Y. C. E. W.

April 27. For apples I think the prospects are favorable to a good bloom; that is, trees will, I think as a rule, make a good start for a good crop if other things continue favorable. It is however early yet to determine very much about them, though I think in this section fruit has all survived the hard Winter in good shape except peaches. These I think were materially hurt in the zero weather. L. B.
Stanley, N. Y.

April 25. As to fruit buds, they are yet in a backward condition. In our own locality (the Wallingford district) the prospect for peach blossoms is good, even Elbertas showing a good percentage of live buds. In most orchard localities yellow varieties are showing next to no live buds; white varieties, a considerable per cent. alive. I believe this locality is more favored than any other peach section I know of in the eastern district. As to apples, I think there will be a heavy blossoming, yet they are not forward enough to show definitely just the situation. J. NORRIS BARNES.
Connecticut.

We have had a very backward Spring. Almost all farmers are behind with their work, some not through hauling manure yet, and scarcely anyone through plowing for corn. But few early potatoes planted, and some just seeding their Red clover on wheat ground. Most fruit growers are through spraying. Peaches and plums have just blossomed out. Some fruit growers report that they will have a full crop of peaches, while others say their crop will be very light. Many apple and peach orchards and grape vineyards have been planted out this season. Wheat $10; hay, mixed $16; corn 70; butter 30; eggs 18; pork $10. Horses from $100 to $200; cows from $50 to $100. Large quantities of cantaloupes will be planted this season. C. H.
Dover, Del.

April 23. Spring has been unusually backward and cold this year. We finished sowing oats to-day. There is a saying in this part of the country that if fruit trees do not blossom in April there will be no fruit, but the buds look so dormant that I cannot see how they will get out before May. Prices on everything are high and farm labor is scarce. Each morning they let out from 25 to 30 men from the "lockup" where they seek shelter at night, but as far as I can learn not one of them ever hunts employment in the country. M. J. K.
Hardin Co., O.

The section in which I live is undergoing a change, like the one that caused Goldsmith to write "The Deserted Village":

"A noble peasantry, its country's pride,
When once destroyed can never be supplied."

The weary plowman no longer plods his way, he has been replaced by the landscape gardener, and his plows have changed to a gas-pull lawn mower; his once fertile fields to golf links and tennis courts, and a real, genuine son of the soil is a rare article here. They are all agriculturists; they run a newspaper, a bank, or a trust company in Philadelphia, and try farming with imported cattle, attended by valets in white duck suits. Sooner or later they get tired and quit, and all they have to show for their egotism is the knowledge gained that they don't know it all. I claim that it takes a better man on the farm than it does in the bank. Plowboys have gone to the city and made good in all the professions, but I have yet to see the first back-to-the-lander with a check book and an exaggerated opinion of self importance who could make a farm pay a profit. T. L.
Chester Co., Pa.

Get Your Canadian Home
From the Canadian Pacific

WE will make you a long time loan—you can move on the land at once—your Canadian farm will *make you independent* and

We Give You 20 Years to Pay

Rich Canadian land $11 to $30 per acre—*one-twentieth down*, balance in 19 payments with interest at 6%. Long before final payment comes due your farm will have paid for itself.

We Lend You $2000
For Farm Improvements Only

No other security than the land. You are given twenty years to pay with interest at 6%. In case of approved land purchaser, we advance live stock to the value of $1,000 on a loan basis.

Or if you want a place already established, you will find one on our Ready-Made-Farm. All planned by our experts, and our service and advice is yours *free*.

This Great Offer Is Based On Good Land

Finest on earth for general mixed farming—Irrigated and non-irrigated lands. Located on or near railway. The famous Canadian West has magnificent soil, good climate, churches, public schools, good markets, good hotels, unexcelled transportation—and 20 years to pay. Time is precious. Write today.

35 BUSHELS PER ACRE was the yield of WHEAT

160 ACRE FARMS IN WESTERN CANADA FREE

on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard, is now the owner of 320 acres of land. In 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.

Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.

The crop of 1913 was an abundant one everywhere in Western Canada.

Ask for descriptive literature and reduced railway rates. Apply to Superintendent of Immigration, Ottawa, Canada, or Canadian Government Agent.

THE RURAL NEW-YORKER, 333 W. 30TH STREET, NEW YORK

Top-Working Small Trees.

I have a number of trees of about 2½ to three inches in diameter, at a distance of 18 inches from the ground. The fruit is of poor quality and the limbs forming the frame of the top are very poorly formed, making weak trees, which are liable to split when the tree is older. Would it be advisable to saw off the top, making the stock a stub of 18 inches and inserting grafts in this; or, to place grafts on stubs of main branches and to graft but few each year until the whole top was top-worked? These trees are thrifty and five or six years old. T. J. S.

Ligonier, Ind.

Wherever possible I would advise that the smaller limbs be top-worked a few at a time rather than the entire trunk of the tree. This will cause less shock to the tree, and will leave some leaf area to elaborate food and pump sap to the scions. If the scaffold limbs are so

TOP-WORKING SMALL APPLE TREES.

placed as to be a danger to the future of the tree, the main trunk should be worked at once. The above illustrates a combination of these methods. Dormant scions should be used, and the wounds thoroughly waxed for the best results.

M. W. RICHARDS.

A Sensible "Back-to-the-Lander."

One of the most interesting things connected with our work is the study of the letters from town and city people who meditate some future move to the country. Some of these back-to-the-landers are not very wise about their plans. They are enthusiastic, and somewhat carried away by the stories which are told them of the great possibilities on a farm. There are others, however, who go at their plan with a thorough investigation, and they do not make their start until they know just what they are doing. Many of these people are small business men, who have been taught by their town experience to consider things carefully. The following letter is from a candy manufacturer in a New England State. This man hopes some day to go to the country and live upon a farm, but you can see from his letter that he is not going to plunge, but study the proposition as carefully as he would if he were to sell out his present business and establish himself in another line with which he was not at all familiar. We would commend this man's view of the situation as one well worthy of imitation.

As you will note, my line of business is quite remote from the line your paper takes up. Yet in spite of the fact that I take three trade papers, THE R. N.-Y. seems to get read each week ahead of all the others, so while I may say I am a confectioner by trade, I am a farmer at heart, and I enjoy very much reading the things your paper takes up. It seems to me if I were a real farmer I could do without a plow rather than THE R. N.-Y. However, I am in hopes some day to be back on the sod breathing God's pure air and treading on something besides paving stones. I know something of farm life, being born and brought up on one, and yet I believe before a man should make a back-to-the-land move he wants to think carefully and choose wisely. Farming to-day is a big business proposition, and has to be conducted on business methods, as well as any other business enterprise, to make a success. The day is past when any fool could farm. O. S. M.

Maine.

Spraying and Bird Killing.

[On page 554 was printed a statement from a bird-lover who objected to spraying poisons for killing fruit worms. She stated that in Western New York the slaughter of birds from this spraying was "something awful," and that even cats were killed by eating the poisoned birds. We have put the question up to our practical fruit growers.]

I notice on page 554 the clipping from the "Fitchburg Sentinel" regarding spraying and birds. In this neighborhood nearly everyone sprays with lime and sulphur and arsenate of lead. Our own orchard is sprayed thoroughly each year, and I have yet to see the first bird that that has been killed or injured by such spraying. We also have two cats that roam our orchards every day hunting for mice, and a neighbor has seven cats, and I have yet to hear of the first one to be injured by eating poisoned birds. Every season we raise hundreds of chickens, and from the time they are hatched until Winter they run under these sprayed trees. A foot of our orchard is in sod, and we cut and feed to cows and horses the hay that grows under these trees. It is safe to guess that all such fool things that crop out from time to time in the magazines and dairy papers emanate from the brain of some bird crank who is blessed with more sentiment than real knowledge of the bird question.

Vermont. A. A. HALLADAY.

On page 554 is an article relative to the slaughter of birds by the use of arsenical sprays. I accept your invitation to the readers from Niagara County to tell of their experience, and in justice to the farmers of the county the unjust impression such an article would create should be corrected. I have used arsenate of lead in spraying for several years, but I have never observed any ill nor disastrous effects upon the birds from its use. I am well acquainted with the spraying conditions through the county, and I feel confident that such a condition as the article cites is most unusual, and not, by any means, a general condition in the county. HOWARD ALLEN HOPKINS.

Niagara Co., N. Y.

Unless conditions differ greatly here in Massachusetts, I should say that the letter in Park's Magazine is greatly exaggerated. On my place in Medfield in 1912 I found three birds dead from eating insects poisoned by spraying. That year I had 39 nests on my place of 14 different species of birds. The following year, 1913, I sprayed all fruit trees, but left the elms unsprayed. I found only one bird that I thought died from poison. Incidentally the elms were every bit as free from damage as the trees along the roads which were sprayed by the town. But I would not advise anyone to try the experiment of giving up spraying, unless he has the birds nesting on his place first. I made an effort to attract birds. Many birds that die undoubtedly go into thick weeds, and are never found, but I think the letter quoted is a good deal exaggerated. DAVENPORT BROWN.

Massachusetts.

The article quoted seems to be very much exaggerated, and misleading. I have sprayed our apple orchards where we keep baby chickens, and have seen no ill effects. The chickens were not confined during the spraying, and ran about at will. Naturally they were frightened at the approach of the spray team with the large horses attached, and got into their coops until the sprayers had passed. I have never seen a dead chicken or a dead bird in this orchard, or any dead birds in the orchards where the chickens are not kept. The amount of arsenate of lead used is so small—three pounds to 50 gallons of water—that there is really no danger to the birds, and the sun quickly dries up the moisture on the leaves. Such statements as the one quoted on page 554 appear every year as the season comes around, and are made up entirely from imagination in the first place, and then kept in storage until Spring is with us again, and something sensational is wanted, when the article is revamped and put on duty once more. It is then copied by our paper from another in order to fill the space, and goes in that manner from one end of the land to the other, from the Atlantic to the Pacific. Something sensational is what many papers desire. The plain facts and truth are not effective enough for numerous editors. HORACE B. PARKER.

Massachusetts.

I have over 300 plum trees, and some cherries and apples. Gooseberries and the like I spray every year at least six times in a season, and I have never found a dead bird either on or around my place. Under the trees I have Alfalfa growing, and in it run old and young chicks, and not one of them ever died, though the Alfalfa is white with spray. All kinds of birds nest and raise their young in my trees, red breasts, redbirds, bluebirds, mocking-birds and droves of sparrows. I use three pounds arsenate of lead to 50 gallons of lime-sulphur, with no bad results to any birds here.

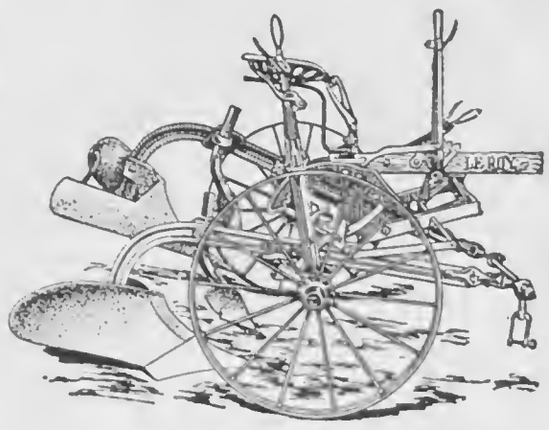
What One Farmer Says About The Light Draft Le Roy Sulky and Small Horses.

Le Roy Plow Co.,
Le Roy, N. Y. Dec. 18, 1913.

Gentlemen:—When looking for a sulky plow I watched my neighbors as they had different kinds and I made up my mind the Le Roy was the kind for small horses and as I have used your walking plows and found them all right, I bought one and am well pleased with it. I broke up four acres that never was plowed before and it worked fine.

Yours truly, William Redmore,
Cameron Mills, N. Y.

The Le Roy handles just as easily in small fields as large and will turn the same size furrow as any other with much less horse power.



MANUFACTURED BY

The Le Roy Plow Co.

LeRoy, N. Y., U. S. A.

Every Farmer likes the **LIGHT DRAFT LE ROY** because it works so easily, does such good work in a large variety of soil, is easy on the horses, pays for itself so quickly and saves waking 7 miles to the acre.

The Le Roy is guaranteed to do better work than any other reversible sulky plow made. Ask your dealer for a trial or write us.

We are not in a Trust or Combine, but are a strong Independent Co.

LE ROY PLOW CO., LE ROY, N. Y.

Hope Farm Notes

THE HOPE FARM SCRUBS.

You may call them what you like—scrubs, culls, mongrels or "hens." The score card shows that some of them would take fair place in a poultry show, but they stand as ordinary hens. What are they doing? You remember that up to March 1 these hens consumed 80.1 pounds of mash and 158 pounds of grain. Thus the eggs they had laid up to that time cost seven cents each for feed alone! A friend in Pennsylvania thinks these hens will not pay for their feed before November 1, when the contest closes. He sent a dollar for that school for colored youth in Georgia, and a backer of the hens has put up another dollar for the school. I do not wish to start any gambling or betting schemes, but I would like to help the school while we watch the hens.

DOING BETTER.—The man who has so little faith in the Hope Farm scrubs is likely to lose, for they came forward in March, and are doing even better in April. During the month of March they consumed 25.18 pounds of mash and 48.17 pounds of grain. This means a total for 150 days of 105.28 pounds of mash and 206.17 of grain. At the prices figured last month this means a total cost of $5.96. Thus the average cost for each hen is 59.6 cents, or a little short of .4 of a cent per day—each hen averaging 1.12 ounces of mash and 2.3 ounces of grain per day. To my surprise these scrubs are not such gluttons as we had been led to expect. We shall find that many other pens in the contest consumed considerably more food. Now up to the first of April these 10 hens laid 214 eggs. As the feed cost was $5.96 these eggs cost about 2.8 cents, or 33.6 cents per dozen. Thus the scrubs had not yet paid for their feed up to April 1, but I predict that on May first they will show a profit.

THEY ARE COMING.—It took these hens a long time to wake up. They all had colds to start with, and were poorly developed. In January several good judges ridiculed the folly of entering such birds, and freely predicted that several of them would never lay an egg. I stayed right by the scrubs, and they stayed by the feed hopper. In the week ending April 17 these "culls" laid 50 eggs. There are 82 pens in the contest and only 13 of them laid more eggs than my scrubs during that week. Tom Barron's famous Wyandottes laid only 36 and his Leghorns 47. Thus for this brief period the Hope Farm scrubs laid all around the champions. I think these birds have just begun. It took the turtle some time to get going, but he kept at it. You see I stay right by these hens yet. April and May will see them paying their bills.

INDIVIDUALS.—When it comes to individual records we have another one coming. Since this contest began three of my birds have laid 45, 41 and 37 eggs respectively. The best one is a mongrel showing some "Red" blood. This bird laid 45 eggs, beginning the latter part of January. At the average cost of feed she consumed 59.6 cents worth, which makes her eggs cost about 16 cents a dozen thus far. During the month of March my best bird laid 22 eggs at an average cost of 14 cents for feed. Here is another thing for the gentlemen who had so much fun laughing at my scrubs. During the month of March out of 820 birds in the contest, 105 hens and no more outlaid the best feathered Hope Farmer with her 22 eggs. There were 18 of the blue bloods that never laid an egg, seven laid one egg, nine laid two, 10 laid three, seven laid four, nine laid five, 11 laid six and so on. Those famous Tom Barron Wyandottes gave one hen laying 28, another 25, another 23, and one more with 22. The other six fell below my best hen. There are 150 purebred Reds in the contest, yet only 19 of them laid more during March than the best Hope Farmer! There are 330 White Leghorns, yet only 25 beat our best bird with 22. Not long ago one of our friends seemed a little afraid that the Hope Farm man would be bluffed or laughed out of this contest. I rather think not, when even for a week these scrubs can beat out Tom Barron's Wyandottes and show up a few individuals capable of getting near a front seat. Our birds made a very poor start, and they may dry up yet after a short spurt, but in any event we stay right by them, and will carry through the plan.

HOME HENS.—Our birds at Hope Farm are laying well. A pen of 30 R. I. Reds gives us 20 eggs a day, more or less. Of course that does not touch the feathered wonders that we hear about, but seldom see. Yet these Reds pay. The runt Leghorns are laying well, and their eggs are fertile, as little chicks attest. One of these pure Leghorn runts is gray—barred somewhat like a Plymouth Rock. The scientists tell us that the plumage of the Leghorn carries this tendency to revert to barred or gray markings under under some conditions of breeding. While the hens are doing well now I have little faith in them for Christmas eggs. The way to hatch out Christmas eggs is to set the infertile eggs in the water-glass incubator and keep them there until wanted.

COVER CROPS.—The following note came last Winter, but in some way it has been left until now:

On page 1350 the Hope Farm man states that "next Spring, when the thick mat (rye) is plowed under, it will be as if nature had hauled 10 or 12 tons of good manure * * * and spread it over each acre." Will he explain how this is reasoned out? He cannot mean that this "mat" of rye would collect and hold nitrates, phosphoric acid and potash enough to equal 10 or 12 loads of good manure, aside from the vast amount of humus supplied by the latter. The rye, if matured, would only supply approximately a ton of straw for humus to an acre. OAKWOOD FARM.

Orange Co., N. Y.

As things look now on the hill I would stand by this remark. The "mat" is not rye alone, but a combination of rye, Crimson clover and turnips. Of course a crop of rye alone would not be worth 10 tons of manure, though it would be worth very much more than one ton of straw. The clover and the turnips will add much organic matter, while the clover adds nitrogen. Remember, too, that we use lime after plowing this stuff under. This hastens decay and makes the plant food available, while the rapid fermentation is good for this tough, hard soil. The Delaware Experiment Station found the following plant food in crops from one acre:

POUNDS PER ACRE.

	Nitrogen	P. Acid	Potash
Turnips	109.1	25.9	142.7
Cr. Clover..	134.4	61.2	88.2

The plant food in the acre of turnips was worth $21.09; that in the clover $22.37.

This includes both top and root. I do not pretend to say that all this plant food is added to the soil. I think about half of the nitrogen in the Crimson clover is so added from the air. I have found that the turnips have the ability to use unavailable forms of potash and phosphoric acid, and leave them so that following crops of corn or the trees can use them. I believe that at least half of the potash and phosphoric acid in these turnips is a clear gain to that hard soil in available plant food.

Ten tons of stable manure may contain 100 pounds of nitrogen, 60 of phosphoric acid, and 120 of potash, and perhaps 5,000 pounds of organic matter. While I do not claim that my cover crop will add to the soil this amount of plant food, it *will* add more organic matter, and with the use of lime I can make this organic matter more useful to my soil than the straw in the manure. With the price of manure and the cost of hauling it up my hill, 10 tons would cost me at least $40. I think I am justified therefore in saying that Nature has just about made me a present of 10 tons of manure in the rye, clover and turnips. At least, I would rather have this crop for what it cost me than to pay for the 10 tons of manure. I do not blame people for doubting some of these statements about cover crops, lime and chemicals, but those of us who have stayed by them year after year so as to see their effect know something of their value. The same inquirer asks this:

Will you also advise regarding success of using Soy beans in corn? We hear it has not proven satisfactory owing to the corn shading beans too much.

I do not know, for the truth is that Soy beans have never been very successful with us. Cow peas pay better. Our reports indicate that Soy beans in corn do not always pay. I would rather plant the corn alone, or put sunflowers with it. I would plant the Soy beans alone and not put them in the silo, but cut and cure for dry fodder.

WORKING UP TIMBER.—I have just completed a venture that may interest readers. When I came to get bids on my new house on my farm in New Jersey I found it was going to cost so much that I was completely discouraged. When it occurred to me that I had enough standing timber on my farm, principally dead chestnuts and oaks, to do the job, I immediately set to work to find someone to bring a mill to the farm and saw the lumber for me by the thousand. I could get no one to touch it on account of there not being enough to pay. Finally I hired a sawmill, picked up my own crew, used my farm help and team to haul the logs, and finished the job. The lumber is now in the house and has been for a month, although we did not start to move the mill to my farm until January 1. I think I saved about $1,500 on the operation, not including the value of the trees on the stump. Besides I have built an ice house out of what was left, and have still enough on hand to furnish the timber for a good big barn, also a big pile of stove wood and sawdust. I presume I would not have had the nerve to have undertaken the job if I had not been brought up around my father's sawmill in North Carolina, and had had charge of a large sawmill on the Nense River in North Carolina below New Bern, just after the Civil War.

E. F. H.

That interests us, as we are in much the same situation. I have 30 acres of chestnut (dead and dying) and oak, yet it seems impossible to sell the trees on the ground. Several parties have made so-called offers which are more or less polite invitations to make them a present of the property. The only way that I can see for us to get anything out of it is to do it ourselves. I plan to buy a sawmill outfit, including an engine, locate it in the woods and work the job when other work is slack. I find there is fair sale for 2x4's and other timber when cut up to order, and we want to put up several buildings ourselves. When a man sells standing timber he does well to get 30 cents on the dollar. Cut it up yourself and you can make fair wages and a little over. H. W. C.

"GOOD gracious!" exclaimed Miss Priscilla when she saw the hired man wearily pulling a loaded wheelbarrow. "It would be easier if you pushed it." "Maybe," was the answer; "but I'm tired of the sight of the thing."—N. Y. Evening Post.

The Jaboticaba.

Bulletin 92 of the Office of Foreign Seed and Plant Introduction discusses an interesting Brazilian tree with a peculiar habit of fruiting, shown in Fig. 283, page 690. This tree, botanically Myrciaria cauliflora, belongs to the myrtle family. Says the bulletin:

Among the fruit trees cultivated in gardens about Rio de Janeiro the Jaboticaba is one of the commonest, and certainly one of the most beautiful. The largest trees are 30 to 40 feet in height and fully 40 feet in spread, with dense, umbrageous, dome-shaped heads of light green foliage. The individual leaves vary in size according to the variety, some being three inches in length while others are not more than two, oblong-lanceolate in form, glossy, light green in color, usually pink in the young stage. The trunk of the tree is oftentimes very large, one specimen that we measured being 80 inches in circumference at the base, and usually branches close to the ground. The bark is smooth, grayish-brown in color, reminding one of the bark of the guava and other myrtaceous fruits.

The name jaboticaba is a Tupi word, spelled by some authorities *jabuticaba;* this name is applied only to the fruit, the suffix "eira" being added to signify the tree, making the word "jaboticabeira," or jaboticaba-tree. The name is usually pronounced here at Rio as though spelled ja-bu-ti-ca-ba, with accent on the fourth syllable.

The tree flowers in May and June, and the fruit ripens in October and November. As signified by the specific name, *cauliflora,* the fruits are produced on the old wood, and we have seen many trees whose trunks were literally covered with fruits down to within two or three feet of the ground. The fruiting is not confined, however, to the large wood, but extends clear out to the ends of the smallest branches; the fruits are sessile or nearly so, and a tree covered with them from the ground to the ends of the small limbs presents a rather unusual appearance, to say the least.

The fruits seen in the markets here vary greatly in size, but otherwise seem to be alike. A good specimen is an inch and a half in diameter, round or nearly so, and dark maroon-purple in color, greatly resembling in appearance some of the grapes of the Rotundifolia type. This resemblance extends to the internal characteristics of the fruit as well, the texture of the flesh, its color and flavor, as well as the seeds, suggesting a grape more than any other temperate fruit. The skin is thick and very tough; it is broken by squeezing the fruit with the thumb and first finger, when the pulp slides out into the mouth and the skin is discarded. The pulp is translucent, very juicy, and of a subacid, pleasant flavor, with a rather peculiar "twang" which one is not sure to like at first, but which is very agreeable as soon as one becomes accustomed to it. The seeds, one to four in number, are rather large and adhere closely to the pulp; the boys here seem to swallow them, but this may not be a very desirable proceeding from a physiological standpoint. The Brazilians seem almost passionately fond of this fruit, especially the children, who spend hours at a time under the trees hunting for the ripe fruits and then working them off with a long pole, if they are where they cannot be reached.

Small Greenhouse.

I was very much interested in the description of a small and inexpensive greenhouse described by P. L. W., Michigan, page 517, for it is my intention to build something of the kind the coming Fall. I have 18 hotbed sash which are in good condition, and I thought that they would make all of the roof for a house about 12x30 feet by getting some small sash to be used for ventilators. There were one or two things which P. L. W. did not explain. What arrangement did he make of his smoke pipe? Was the stove set below the level of the path? About what size of stove would it require for a house the size I mentioned above? Would it not be better to have the walls lower or the benches higher, so that there would not be any bench space in the shade? I thought of having the roof six feet wide on one side and about eight on the other. My house would set very nearly the same as P. L. W.'s, but possibly not quite square with the different points of the compass.

Madrid, N. Y. W. H. B.

W. H. B. can use his hotbed sash for a greenhouse roof, but they shut off a lot more light in the Winter than regular sash bars would. In the Summer this would be an advantage. Stove pipe to my stove runs up from stove to within a foot and a half of ridge, then west to the end and up into a five-foot galvanized stack. This stack is soldered to a pane of galvanized steel and is placed in the roof just like a pane of glass. Stove sets on level of path. I doubt if one stove would heat satisfactorily over a 12x20 house, and for this size I shall use an 18-inch stove the coming Winter. I now use 14-inch. In a 12x30 house I should use two 16-inch stoves, one near each end, and fire each moderately. This would be much better than forcing one large stove in the center, and use no more fuel. We have a market gardener and plant grower near us who uses four such stoves to heat his 60-foot house, and says he uses less fuel and with better results than formerly, when he tried to heat it with two stoves. If no bench space is wanted in the shade, a row of 18-inch glass can be put in the south wall just below the plate; 32 deg. is the standard pitch of greenhouses but many uneven-span houses are being built and used satisfactorily. P. L. W.

Michigan.

Dry Bordeaux; Burbank Plum.

1. Your boys used dry Bordeaux on their potatoes. What do you think of its efficency compared with the solution? Is it practical to dust more than a single row at a time? What is the formula for making the dry powder? 2. What can be done with the Burbank plum? The consuming public does not care for it in the natural state or preserved. How about making jelly of them, or evaporating the fruit? F. W. M.

Massachusetts.

1. We have tried dry Bordeaux several times. The weather condtions have much to do with its effectiveness. The best time to apply the powder is in the early morning of the bright day, when the dew is on the vines. When the powder is dusted carefully on such a day, the moisture dries, and the powder remains. Under such conditions we have found it very effective, when Paris green was mixed with it, for destroying bugs. For preventing the blight, the powder has not been as effective with us as the liquid Bordeaux. In a very windy time, or where there are frequent showers, the powder does not appear to stick to the vines as well as the liquid. For low vines and shrubs, when the conditions are right, the powder is effective. For trees, and when a high wind is blowing, or with frequent showers, we have found the liquid more effective.

2. We shall have to pass the question of what to do with the Burbank plum. We would like to hear from Mr. Burbank himself, or from some of his admirers.

Grafting Cherry

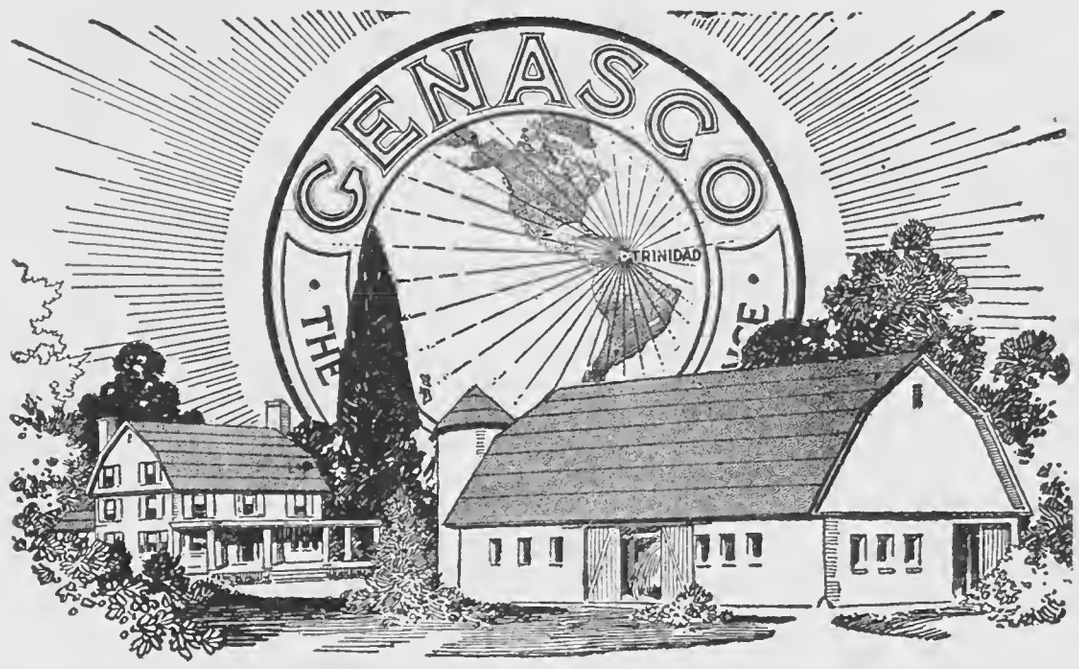
We have a sweet cherry, somewhat heart-shaped, beautiful clear red with one side of a pale amber color. Description of Rockford resembles it most nearly, except that Rockford is said to be large. Ours is about the size of Early Richmond, ripens the latter part of July and fore part of August. Can this be grafted or not? If so, on what kind of stock? Our tree is giving signs of decay. Could they be grafted on Pigeon cherry tree?

Oswego, N. Y. E. E. K.

This may be the Rockport (not "Rockford") cherry, but the name is of little consequence to the owner of this tree in view of the fact that it suits his uses well. It is not possible to name a variety certainly from meagre description. The proper way to get at the identity is to send to the pomologist of the U. S. Department of Agriculture at Washington, D. C., for boxes and franks to enable the inquirer to send on specimens for examination at the proper season, and it is possible the correct name may be given. There need be no difficulty in propagating from the tree by budding or grafting on sweet cherry or Mazzard stocks. The wild cherries are none of them suitable for this purpose. One of the very best of the late sweet cherries is Schmidt, which can be bought from the nurseries, and I would advise planting some of the trees of it also, for it is excellent for market and house use.

H. E. VAN DEMAN.

WHITEWASH AND FROST.—What is there to the advice to whitewash peach trees with lime spray in early Spring to avoid damage from frost? Whitening the trees in this way helps to some extent. The lighter color of such trees means a slower absorption of heat, and thus the buds do not start and develop as rapidly as on the darker-colored trees. Growers who have tried this agree that if they can keep the white color on the trees they can hold back the buds and often save them from a late frost. The trouble is to keep the whitewash on the trees. It is too easily washed off by Spring rains, but when it can be kept on the trees it will surely help to hold back the buds.



The roofing with real waterproofing

Choose roofing whose waterproofing is a natural product. Man cannot make waterproofing that equals asphalt made by Nature.

Genasco

THE TRINIDAD-LAKE-ASPHALT
Ready Roofing

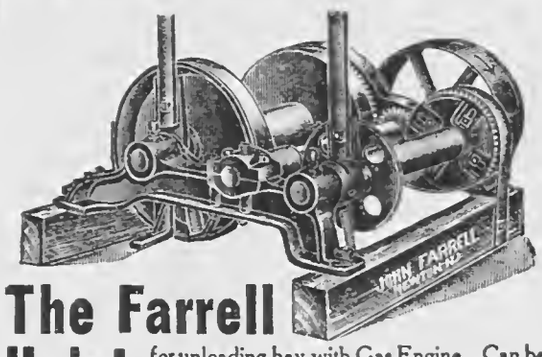
is made and waterproofed with *natural* asphalt. This Trinidad-Lake-Asphalt waterproofing goes clear through. It doesn't crack in any weather.

Get Genasco for lasting protection and true economy.

THE KANT-LEAK KLEET keeps seams watertight without cement and prevents nail-leaks—packed in rolls of smooth surface Genasco.

Ask your dealer for Genasco; smooth or mineral surface—several weights. Write us for the Good Roof Guide Book and samples.

The Barber Asphalt Paving Company
Largest producers in the world of asphalt and ready roofing
Philadelphia
New York San Francisco Chicago



The Farrell Hoist for unloading hay with Gas Engine. Can be operated from load. Has quick return drum and band brake. Price right. For Circular address JOHN FARRELL, Newton, Sussex Co., N. J.

HAY CAPS

Stack, wagon and implement covers; waterproof or plain canvas. Plant bed cloth, tents, etc. Circulars, samples.
HENRY DERBY
453 Y, St. Paul's Ave., Jersey City, N. J.

The Acre-an-Hour Sifter

beats every hand implement for killing Potato, Melon Bugs, Cabbage Worms, etc. Applies Plaster, Lime, etc., mixed with Paris Green or Arsenate of Lead. Regulates to cover big or little plants, also to apply any quantity of any kind of manufactured dry insecticides. Will operate as fast as desired. Better, easier and faster than any $5, $10 or $15 spray pump. Insist on your dealer showing you this wonderful little implement. Prepaid, 75c. Agents wanted. Circulars.
ACRE-AN-HOUR SIFTER CO.,
Dept. B, Poughkeepsie, N. Y.

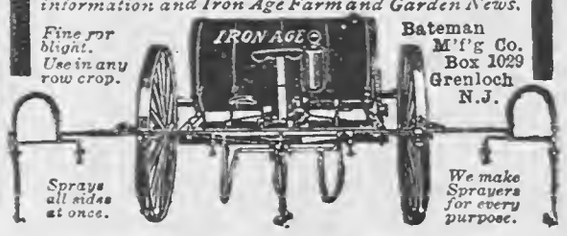
Something New In Traction Sprayers

Sprays 4 rows with 12 nozzles, 3 on each. 8 are low-down nozzles for still more thorough spraying of sides and underside of vines. Spraying saves your crop and *increases the yield.* One of a dozen

IRON AGE FOUR and SIX-ROW

Traction Sprayers, 55 or 100 gallon wood tanks, double or single acting pumps, wind shift, nozzles, strainers, thorough mixing, no corrosion. Ask your dealer about them and write us now for *new "Spray" book, spray information and Iron Age Farm and Garden News.*

Fine for blight. Use in any row crop.



Bateman M'f'g Co. Box 1029 Grenloch N.J.

Sprays all sides at once. *We make Sprayers for every purpose.*

HAVANA FARM TRUCKS.
Both Steel or Wood Wheel.
Especially adapted for farm purposes and coming into more general use every day on the roads, because of the wide tire. You will appreciate our free catalog.
HAVANA METAL WHEEL CO., Box 17 HAVANA, ILL.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

The Rural New-Yorker has, at its command, the largest and most efficient corps of correspondents and advisers ever gathered by any farm paper in the world. Thus we can obtain for you the last word on any subject relating to the soil, its cultivation or its products, or the human life of the farm. This service is yours for the asking.

*

THE present Indian Commissioner has issued instructions to superintendents which begin as follows:

I greatly desire it to be understood throughout the service that the present administration of Indian affairs is determined that every Indian shall have opportunity and encouragement to accomplish industrial betterments.

Good. Let every Indian have such opportunity, and do not stop there. Take in the white men, the black men and those of various shades of brown. Why give the Indians any special privilege? Also include the women, and particularly the children, while we are at it. "Industrial betterment" is good.

*

SINCE the first of March there has been great complaint about the poor hatching of eggs. Early in the year hatching reports were very favorable. Then came the delayed hard Winter. There were many frozen combs and the vitality of breeding stock was greatly impaired. With all this some breeders made the mistake of forcing breeding pens for high egg records. The result has been many very poor hatches. Conditions are better now, but it looks as if the early chick crop will be light. Many breeders tell us they will continue to hatch much later than usual, but from present indications good pullets will be scarce and high next Fall.

*

I am sending my milk to a coöperative creamery, where they sell by test, and do not think I get the test that I should. I think that I could get a sample from the creamery. Is there any way that I could get it tested by the State, and where should I send it. I have saved samples from my milk at home and had it tested as an individual cow, and they made it test higher than at the creamery. S.

Under the New York law the Commissioner of Agriculture is authorized to make independent tests in a case of this sort. If you think you are not receiving a fair test write quietly to Hon. Calvin J. Huson, Department of Agriculture, Albany, N. Y., and tell him what you suspect. He will send an inspector to take samples and make tests. Do not tell the creamery what you are doing. It will be an advantage to have this inspector come without warning and take samples without any preparation.

*

I WANT to express my appreciation of your views on Mexican war talk, as expressed in editorial on page 672. I am rather inclined to be hot-headed and do rash things, but I admire the man who can first take sober second thought. I believe, as you do, that this is a disreputable quarrel, and if persisted in will be terrible in its consequences. There are nobler battles to be fought, which, if not accompanied by so much of "shouting and flag-waving" have infinitely greater prospects in leading the millions of our poor, oppressed people up onto higher ground and teaching them to demand their right as citizens of this great country. E. D. P.

We are safe in saying that this note expresses the sentiments of the great majority of our readers—and thoughtful people generally. Here and there are noisy shouters and fire-eaters—who may be trusted to keep far away from any firing line. The great body of sober and sensible Americans do not want any war or any war scare. Representatives of the South American republics have offered to mediate and help settle the difficulty. We hope they will succeed, not only for the sake of honorable peace, but because a settlement arranged in this way will have a permanent effect upon the future of this continent. What are known as the Latin-American Republics have long distrusted this country and its policy toward them. The prompt acceptance of their offers to help settle this Mexican trouble will go far to give them a kindlier feeling and greater respect for us. No finer thing could have happened in this unfortunate situation, and we sincerely hope that these republics will be able to arrange for a lasting peace.

*

SOME of the real estate agents and boomers do not think much of our general advice to back-to-the-landers. It is somewhat like the famous advice about marriage—"Don't." We qualify this, however, by adding: "Until you know what you are doing, and have money enough to provide fair capital." A man may obtain the capital, but knowledge comes only through raw blisters. Here is one conclusive argument from a real estate dealer:

"What do you know about going back to the land anyway?"

Why—very little. We went back ourselves, bought a rough hillside farm and have kept quite accurate accounts. Of course that experience is a very poor qualification beside the brilliant imaginations of some of these modern writers, but it is the best we have. Then during the past 20 years, beginning with Geo. A. Cosgrove's story, THE R. N.-Y. has printed more actual true accounts of back-to-the-landing than all the other farm papers put together. We might be said to have made this a specialty, having been through the mill ourselves.

*

THE U. S. Census Bureau has made a new estimate of the country's population. This gives New York City a total of 5,333,537—a gain in four years of 786,047. The State has now a population of nearly 10,000,000, and the entire country, not including territories, is 98,731,324. Every State in the Union except Iowa has gained. All the large cities and towns show great gains. Our farmers are interested in this last fact, for upon the water-shed draining into the upper Atlantic may be found the finest markets of the world. Here are two of the world's largest cities and six averaging more than half a million each. There are 26 with more than 100,000 and averaging nearly 200,000. This vast army of consumers must be fed, and at least half a million of them never stop to ask the price of food which pleases their eye. This Atlantic coast territory is to remain the great headquarters for American shipping and manufacturing, and thus it affords the greatest market future for our farmers. Organization and coöperative work have enabled the producers in distant States to supply much of the food sent into this great section. The same agencies worked out by our own farmers will enable New England, New York, New Jersey and Pennsylvania to supply the finer and higher-priced food which these rich markets demand. That is why the young man growing up on our Eastern farms today has a better opportunity than any other section of the country can offer him.

*

THE larger this country grows the closer its corners seem to be pulled together. Twenty-five years ago the average person on the Atlantic coast had but a dim notion of the northwestern part of this country. Had anyone stated at that time that apples from Oregon and Washington would top the market in New York and be found on sale in every New England city he would have been voted a hare-brained dreamer. Yet for the past six years or more these apples have actually set the price for fruit in our Eastern markets. It is probable that the presence of this fine, graded fruit has done more than anything else to compel our eastern growers to improve their methods. Or California! Men are now alive who remember when some of our wisest statesmen argued that the State was not worth taking or occupying. These men claimed that the deserts and the mountains would forever hold the Atlantic and Pacific coasts apart. Yet this year fresh asparagus was sent from California across the continent and over the ocean to Liverpool, England, and sold at a profit. A man representing a fruit growers' association in Puyallup Valley, Washington, has just visited New York, where he took orders for many carloads of dried raspberries and blackberries. This fruit is to be grown and evaporated in a valley 4,000 miles from this market. This will be done while thousands of acres of excellent berry land lies idle within 150 miles of New York. Formerly the ends and corners of this great country were held apart by steel bars. Now they seem to be at the ends of a rubber band. What mighty force has brought these wonders about? One word tells it—coöperation. The farmers on the Pacific coast have been able to get together, standardize their products, and do their business as an organization. Individual effort could never have carried their products half way across the continent. Beyond that all profit would have been swallowed up by middlemen. No greater argument for organization and coöperation among farmers was ever given than this wiping out distance in continental trade.

*

MR. Frank A. Vanderlip, president of the National City Bank, recently addressed the cotton manufacturers. He expressed the opinion which some of our city financiers have of the farmer. It is a poorly disguised contempt and anger that the farmer will not mind his own business and go on taking his 35-cent dollar in silence. Here is a sample:

If a railroad manager is culpable and is answerable to society for anything less than 100 per cent. of efficiency, what of the farmer and planter, holding the great agency of production—land—and utilizing it with but 40 per cent. of efficiency? That is the indictment that stands against no small part of the agricultural community—a conduct of their business on a basis of 40 per cent. of efficiency.

Mr. Vanderlip forgets or does not know the simplest thing in this entire business. When the railroads are asked to be "efficient" they immediately demand the right to charge higher rates. They demand five cents more of the consumer's dollar as the price of "efficiency." That is just what the farmer demands, and he has just as much right to it as the railroads or any other interest. Give him five cents more of this dollar and "efficiency" will soon take care of itself. He cannot buy the things needed to make him efficient until he obtains his fair share. Cannot the wise Mr. Vanderlip see that the purchase of these things by the farmer would do more than anything he can mention to create markets and improve business? He suggests a national inquiry into the efficiency of farmers. Why not? The more you look into it the more the public will see that there will be no true "efficiency" until the farmers can enlarge that 35-cent dollar! Just think for a moment! "Efficiency" always costs money—for new materials and equipment. Do these bankers and statesmen expect the farmers to perform miracles? It would seem so, for they want farm efficiency on a 35-cent dollar, while all other interests are allowed a larger income in order to become "efficient."

*

HENRY Wallace, the acknowledged leader of farm journalism in this country, recently celebrated his seventy-eighth birthday. Among other things Mr. Wallace said:

I have 10 years of work planned ahead of me. I may not do it all; I may not do any of it, but I am prepared to do it and feel thoroughly able to. Old age is the best part of life. The battles of life are past and a man has little to worry him. He has more control of himself. He knows just what he is capable of doing and is less likely to go astray in his plans. His long experience gives him an advantage, and he sees the world more accurately and with a keener perspective.

Henry Wallace is a great man. Any man who can talk in this way and view life with this cheerful philosophy when close to four score has somehow managed to drink from the fountain of perpetual youth. We have seen too many men at 60, or even at 50, grow sour and cynical as the years leave them behind. The best years of life are yet to come.

"The years no charm from Nature take,
As sweet her voices call,
As beautiful her mornings break,
As fair her evenings fall."

Henry Wallace is a great man because he has found the true greatness of life. That is the power to keep faith and hope and good cheer in his heart so that the young may know the blessedness of growing old.

BREVITIES.

TRY the moth-ball treatment for repelling squash bugs this year.

THE advice to cotton mills is to burn Egyptian cotton-seed found in imported bales. This cleans out the pink boll-worm—very destructive to American cotton.

A "MODEL dairy" has been established in Paraguay—about the last civilized place one would expect to find model dairying. It is a country where even now "butter" is made by putting milk or cream into a skin bag and trailing it over the ground behind a horse.

BULLETIN No. 84 of the U. S. Department of Agriculture is entitled "Experiments with Udo, the New Japanese Vegetable." Udo is Aralia cordata, which is grown here as an ornamental plant. The blanched shoots, treated like asparagus, are highly recommended.

A SHIPMENT of 2,000 apple and pear trees was recently made from Oregon and California to Portugal. They arrived in good condition, and started growing at once. The ends of the world were formerly separated by iron bars. Now they seem to be at the end of a rubber band.

LAND BANK OF THE STATE OF NEW YORK
System of Mortgage Credits Explained.

PART II.

PREPARING FOR BUSINESS.—When the Superintendent of Banks has issued a certificate of authority and approved the by-laws, the association is then ready for business, and the first payment on shares is due. These payments are usually called dues. None of this money, which is called capital, can be paid out for expenses; and for this reason some associations think it well to require each member to pay an initial fee of from 25 cents to one dollar as required to pay organization expenses. In other cases, the necessary expenses are advanced by one or more of the members, and this is repaid later out of the earnings.

HANDLING CAPITAL.—The amount to be paid on shares may be arranged under the provisions of the law to suit local conditions and desires of members. Arrangements may be made to have "dues" paid weekly, monthly, or annually. The shares on loans may be made to mature at any time from 10 to 40 years. Installment shares in a savings and loan association are not paid up in full in one or two payments, as shares are paid in a business corporation. Heretofore the dues have usually been paid monthly, and the plan has been to mature them in about 10 to 12 years. On this plan a member subscribes for one share that will be worth $100 when it matures or "runs out." He pays 50 cents monthly or $6 per year. If loans are made at six per cent. interest, the shares will mature in a little less than 12 years. The member will have paid in in monthly cash installments a total of nearly $70. The profits are added yearly to his credits and he draws out $100, or the face value of his share. If he is a borrower, he must take one share for every $100 borrowed, and besides paying his regular installments he must also pay the annual interest on the loan. These monthly methods of payment have been popular in towns and cities where the members have a steady salary income. It was desirable to make the payments large enough to mature the shares or liquidate the mortgage in about 10 to 12 years.

METHOD OF PAYMENT.—With the advantages of the Land Bank to furnish cash as needed, there will not be the need of large payments nor of maturity of stock or liquidation of mortgages in so short a time. With farmers the monthly payments might in some cases be embarrassing, so under the new plans, payments will probably be made quarterly or semi-annually, and the shares and mortgages will mature any time short of 40 years. To do this the annual payments will be only one per cent. of the principal in addition to the interest. If the interest rate at the Land Bank is 4½ per cent. annually, then a yearly payment of 5½ per cent. of the loan will leave the farm free and clear in about 40 years. Of course, any or all of the mortgage may be paid at any time, and the payments reduced accordingly; but the payment cannot be demanded until the mortgage matures, provided the payments are made regularly. Of course, the same advantage accrues to the member who does not borrow. He or she makes the payments regularly. The amount to his or her credit including the profits from year to year, may be all withdrawn at any time. If the payments are continued to maturity, the face of the shares is all withdrawn at one time.

MEMBERSHIP.—Members of a savings and loan association are those persons to whom shares have been issued or transferred. Guardians holding shares for others have all the privileges of members except the right to vote. Juvenile shares may be issued to minors and dividends paid on same, but the owners of such shares do not have the right to vote. Members of savings and loan associations are divided into three quite distinct classes.

First we have persons who have a steady income who have no wish to borrow, but who wish to save a definite portion of their earnings as it comes in. When they subscribe for installment shares they provide to make regular payments at definite times. They have an absolutely safe investment and the money begins to draw profit as soon as deposited. The enforced payments encourage saving and thrift. In this class of members we always have a number of public-spirited men and women who are influenced neither by the profit or the privileges of making a loan, but who take shares and membership because they wish to be identified with a worthy public enterprise and desire to encourage it. They also find the investment safe and the profit satisfactory.

Second, we have persons with a small but steady income, such as clerks, farm hands and renters, who have an ambition to own a home or a farm, but who have not enough saved to make the first payment. These persons accumulate steadily on installment shares. Their saving is safe, and every dollar is earning profits as soon as paid in. When they have enough saved up to make the first payment on a home or farm, they have established a reputation for sobriety and thrift, and the association is willing to take a mortgage for the balance of the purchase money.

Third, we have the man who has enough money to make the first payment on a home or farm; or who already owns a place and wants to improve it with buildings, fences, drainage or otherwise, and wants to place a mortgage to complete the purchase price, or to meet the cost of repairs. He may already have a mortgage expiring, which he wishes to renew on better terms. He gets the advantage of a long time loan at favorable rates, and with the privilege of amortizing the loan in small annual payments.

SAVING AND ACCUMULATION SHARES.—In addition to the above classification, an association may, if it so provides to do in its by-laws, issue "saving shares" upon which payments are made from time to time as the member may elect; or it may issue "accumulation prepaid shares," on which a payment of $50 or more is made at the time of subscription. The earnings are added to this until the share matures and is worth $100; or "income shares" which are paid for in advance at face value at the time of subscription. The dividends on these shares are paid in cash. J. J. D.

A VERDICT OF SIX CENTS.
Is This the Value of "Reputation?"
"Sky Farm" Brought Down to Earth!

Last week the libel suit of Frederick O. Groesbeck, the poultry dealer, of Hartford, Conn., against THE RURAL NEW-YORKER was tried in the Federal Court in New York City. The complaint was based on an article published in the paper on Oct. 9, 1909, reading as follows:

Mr. F. O. Groesbeck, Secretary of the Hartford Show Association, of Hartford, Conn., whatever that may be, is one of the most impudent and contemptible defaulters that has yet come to our attention. One of our subscribers accepted his notes in payment of accounts that should have been paid in cash. When the notes became due they were protested for nonpayment at the bank, and protest fees added to the account. After exhausting every other peaceable means to collect on them the notes were sent to us. Mr. Groesbeck first attempted to discredit his creditor; but when finally confronted with the facts flatly refused to meet his obligations. He did not even have the decency to do it in respectable language. We believe him utterly unworthy of confidence or credit.

To justify the publication THE R. N.-Y. showed that Groesbeck conveyed his 12-acre poultry farm at Vernon, Conn., to his mother; that in the year 1908 he was being sued for debts, and at that time assigned the chattels of his Hartford store to his father; and made a bill of sale also of his poultry to a man named Trout; that two judgments were entered against him immediately afterwards; and that neither of them has been paid. One of these judgments was in favor of an employee who sued for a balance of wages after four years' service. The contention was that these conveyances were made to escape the payment of just debts. It was shown that several other claims were against him, and returned uncollectable. Lawyers in Hartford had reported that he was execution proof, and consequently that the claims could not be collected.

It was further shown that he advertised himself as the owner of farms when in truth he owned no land or farms. One source of amusement to the court and jury was his alleged ownership of "Sky Farm." After much hesitation he admitted that this was a backyard attached to the house he rented at $35 a month in the city of Hartford, and that he had some cats there. He advertised himself as the president and treasurer of the Hartford Supply Company, and solicited orders and remittances, but was forced to admit that there never was any company by that name. It was further shown that he printed several pictures of his neighbor's large poultry farm and birds and represented them to be his own. He represented his birds as bred from a special line of ancestry for 15 years, and solicited orders for birds and eggs on this basis, but the 5,000 birds that he claimed as his belonged to his neighbor; and he bought birds and eggs from farmers to fill orders. He brought several character witnesses who swore that his reputation was good; but they admitted on cross-examination that they knew nothing of the above record. Several other witnesses testified that his reputation was decidedly bad, and when questioned gave intelligent instances to prove it.

In the Spring of 1908, Groesbeck bought chicks from N. O. Ward, West Willington, Conn., to the amount of $113. He did not pay for them, and Ward sued and took an attachment on the Vernon place. A settlement was then made by Groesbeck paying $50 in cash and balance in three notes. Two of these notes went to protest, and after trying in vain to get the money on them they were sent to THE R. N.-Y. Groesbeck refused to pay and the warning followed. Then for the first time Groesbeck set up the claim that the chicks were not to be paid for unless he sold them at a profit above expense, and that the notes were not to be paid unless he made profit to do so. Ward denied this, and the Groesbeck letters corroborated Ward. The jury evidently refused to believe this absurd story.

The trial took three days and a half. The case was clearly against Groesbeck, and it was expected that the jury would not be out more than 15 to 20 minutes. Later it was rumored from the jury room that 11 jurors were in favor of a verdict for THE R. N.-Y. and one in favor of Groesbeck. The jury remained out all the afternoon. The court expressed the opinion that they should come to an agreement, if possible; and finally they came in for a verdict of six cents for Groesbeck. This is really a more humiliating result for Groesbeck than if the 11 jurors had succeeded in their demands for a verdict for THE R. N.-Y. The verdict for the paper might result because the jury did not think the libel serious enough to be of any account. Such a verdict might be entered against a man of the highest reputation and character. But as this verdict now stands the article is held to be libelous, per se, but that Groesbeck's reputation and character were such that the article could not injure his feelings, his reputation and his business in excess of six cents.

It was shown that THE R. N.-Y. acted solely in the interest of its subscribers and the public and frankly assumed the responsibility and expense of its position; that no prudent man knowing the facts would send Groesbeck a remittance by mail, and for this reason it was necessary for Groesbeck to deceive the public in order to get orders and remittances by mail. The court made it plain in the charge to the jury that a paper protecting the interests of its readers in exposing wrong doing was performing a meritorious public service.

New York State News.

NO MORE LAWS JUST NOW.—The bills passed by the last Legislature that were left in the hands of the Governor have now been disposed of, the 30-day period having expired on April 27. There were about 700 bills left with the Governor, all but 105 of which were acted upon by him. These became automatically vetoed with the expiration of the 30-day period. The Governor has used the pruning knife on the appropriation measures and the total of appropriations will not exceed $39,000,000, which is a new minimum mark for recent years. It is $11,000,000 less than was appropriated last year for similar purposes and less by $6,000,000 than the amount for 1912. This is the first time since 1909 that the appropriations for current expenses have been less than the indirect revenues. The comptroller estimates that the State's revenues to meet these expenditures of $39,000,000 will be $42,000,000. The inheritance tax from an unusually large number of estates of very wealthy men has accounted for the large revenue from indirect sources. In all 522 new laws were enacted this year, which is the lowest since 1891, when 389 laws were placed on the statute books. Last year 838 was the total number. The largest number of new laws in any one year was in 1895 when the total was 1,034.

ORGANIZED LABOR.—In a special bulletin issued by the Department of Labor a few days ago it was announced that organized labor in the State has a greater total of members than at any time in our history. The total membership on September 30, 1913 was 665,248, of which 78,522 were women. The membership increase during the year was 138,576 or 26.3 per cent. New York City has 29 per cent. of the organizations and 74 per cent of the membership. The city's total membership is 491,793.

STATE DRAINAGE LAW.—Gov. Glynn has signed the bill making radical changes in the State drainage laws. It makes practically a new law similar to the drainage laws of Michigan and Illinois. It provides for the drainage of swamp lands in two or more counties as well as in a single county. It creates drainage districts, so that the lands benefited by the drainage may all be in a district and bonds may be issued by that district, instead of the towns issuing the bonds and charging back upon the lands benefited, which has heretofore resulted in trouble and confusion.

CAYUGA FARM BUREAU.—Cayuga County falls into line with a Farm Bureau, of which W. B. Avery of Aurora has been elected president, E. B. Rounds of New Hope vice-president, and Ernest Tabor of Meridian secretary. The meeting for organization was attended by about 100 farmers, and an organization was perfected after an address by M. C. Burritt, Superintendent of Farm Bureaus of the State. J. Robert Teall is manager of the bureau and farm agent.

GOOD SUGGESTION.—"Plant a thousand trees on waste land Arbor Day instead of setting out two or three on school grounds." This sentiment was expressed recently by Dean Baker of the Syracuse School of Forestry. As an example of Arbor Day interest worth while, Dean Baker directs attention to the fact that the Jamestown high school has a tract of many acres on which it proposes to set out a young forest. He will participate in the exercises of Arbor Day there. Ten students are now setting out a tract of over 100 acres with 20,000 trees, at the Chittenango Forest Station.

HIGHWAY OFFICIALS GO FREE.—The Albany County grand jury, after a long investigation of the charges made by James W. Osborne, special graft investigator, against State Engineer Bensel, Duncan W. Peck, C. Gordon Reel and Charles F. Foley, failed to find an indictment against them, and so reported on April 28. The inquiry involved the letting of 26 contracts involving $3,000,000 by Deputy Commissioner Foley, and their approval by the entire commission, Bensel, Peck and Reel. The entire batch of contracts was said to have been approved in an hour's time, according to Commissioner Osborne.

VARY SURPRISED.—State Master W. H. Vary was tendered a surprise at his home on April 27, at Watertown, the occasion being the anniversary of his birthday. About 60 members of the Watertown Grange were present, who left with the State Master a valuable traveling bag as a memento of the occasion. Mr. Vary was assured, according to the report, that his Watertown friends confidently looked forward to his elevation to the office of National Grange Master.

$10,000,000 FOR ROADS.—Gov. Glynn has signed the bill appropriating $10,000,000 of the second referendum fund for the construction of new highways. He, however, declined to approve the companion bill appropriating $675,000 for interest on highway bonds issued under the new referendum. The attorney general has given the opinion that the appropriation did not affect the interest provision in the referendum itself and therefore this interest need not be raised at this time. The Governor's approval of the bill will make it possible to advertise all the roads for which plans and specifications have been prepared, and it will also allow the highway engineers to design, this Summer, the most important roads for the completion of a great trunk line in time for advertising the same in the Fall.

STATE FAIR FINANCES.—At the meeting of the State Fair Commission in Syracuse on April 28, it was reported that the treasury was without funds owing to the fact that the Legislature failed to pass the annual supply bill. It is believed, however, that this condition of things will be remedied when the Legislature meets in extraordinary session May 4. Among the items in the supply bill which failed to get through were these: $45,000 for premiums at the next State Fair; $12,500 for printing and advertising and $15,000 for maintenance of grounds. C. D. Porter of Albion was reappointed superintendent of the fruit department of the fair. The commission has decided to offer a special premium of $175 for the best display of roses, consisting of 500 blossoms of 12 varieties.

Woman and the Home

From Day to Day

WHEN THE CANNON BOOMS!

When the cannon booms,
When the snare drums rattle fiercely
And the feet of men in khaki hammer time out on the pave,
It is easy to be brave;
It is easy to believe God is angry with the other Man, our brother,
And has left the sword of Gideon in our wayward human hand
When the cannon booms.

When the cannon booms,
When the battle flags are fluttering and men are going mad
With the blind desire for glory,
Filled with visions grand and gory,
It is easy to assent
To the Corsican blasphemer's scoffing creed;
It is easy to believe God is with the big battalions,
Whether cherubim or hellions,
When the cannon booms.

When the cannon booms,
When the primal love of fighting stirs the tiger in our blood,
And the fascinating smell
Of the sulphur fumes of hell
Rouses memories of the pit from which our human nature rose,
It is easy to forget,
God was not found in the earthquake, in the strong wind or the fire;
It is easy to forget how at last the prophet heard Him
As a still, small voice,
When the cannon booms.

When the cannon booms,
When the war lords strut and swagger
And the battleships are plowing for the bitter crop of death,
While the shouting rends the ear
Echoing from the empyrean,
It is difficult to hear
Through the din the Galilean
With His calm voice preaching peace on earth to men!
'Twill be easier to claim,
If we will, the Christian name,
To become as little children and be men of gentle will,
When the cannon booms, the cannon booms no more.

—William Herbert Carruth.

*

BELGIUM has conferred the cross of the Order of Agriculture upon Mrs. Belle Van Dorn Harbert of Colorado, president of the International Congress of Farm Women. This is, we are told, the first time this order has been conferred upon a woman.

*

THE girl with a delicate skin should remember that a reddish brown chiffon veil worn when driving, motoring or walking, is an excellent protection against sunburn and freckles, while the white veil is no protection. With the brisk winds and strong sun of Spring a sensitive skin suffers very quickly.

*

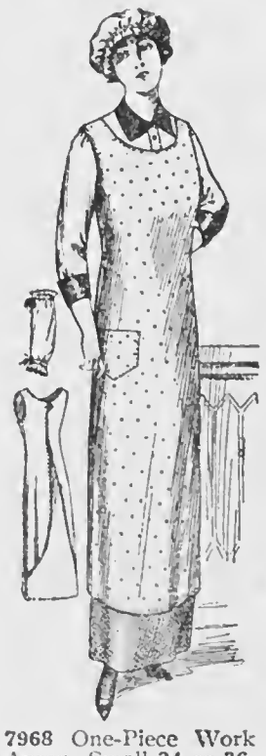
WISCONSIN has an anti-gossip law. The newspapers recently reported the conviction, under this law, of a person who made slanderous statements about another, and who thus became liable to a fine of $250, with the alternative of a year in jail. It was quite a shock to discover that the gossip thus convicted was a man, because we have been taught, from the time of Solomon at least, that talking about one's acquaintances was such a purely feminine failing.

*

THE newspapers recently noted the fact that a very wealthy young woman had entered a New England hospital to take a nurse's course. Later it was announced that she had given up her course and the newspapers quote her as saying: "I thought training in a hospital meant taking care of patients. I find it is three-fourths housework and drudgery." Newspaper stories are not always accurate, and the quotation given may be entirely incorrect in this case, but there is no doubt that many young probationers get their first shock of disillusion in a hospital when they find that wearing a becoming uniform and bathing a patient's fevered brow form a very small part of the duties required. It is hard for them to realize that a woman who is not willing to scrub a floor well is not fit to be trusted with a hospital patient. If we would take all the hard, or tiring, or unpleasant duties that must be done when nursing some member of the family at home, and then multiply them by the dozen or the hundred, we may get an idea of what professional nursing means. Out of the first drudgery, however, arises the passion for service, which puts the work of a nurse on a plane by itself. It was not until Florence Nightingale took the light of her lamp through wretched hospitals at Scutari that people realized nursing was an occupation for educated women. When we contrast the trained nurse of to-day with Sairey Gamp and Betsy Brig, who certainly represented the ignorant mercenary of their period, or with the degraded women who used to be given this work in city hospitals, we may be very grateful for our altered ideals of service. Perhaps, in the course of time, the same solution will be applied to domestic service, and we shall realize that this too is essentially the work of refined women. English papers contain many advertisements of "lady helps," "lady cooks," "lady nurses," "lady gardeners," these awkward terms meaning educated or refined women trained to manual work. Surely it is not unreasonable to suggest that trained mind and character is quite as necessary in one whose work forms part of the home as in the outside helper who is only with us in sickness.

The Rural Patterns.

When ordering patterns always give number of patterns and measurements desired. Price of each pattern 10 cents.



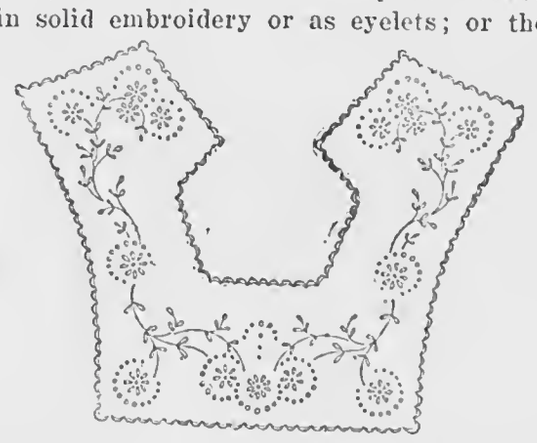
7968 One-Piece Work Apron, Small 34 or 36, Medium 38 or 40, Large 42 or 44 bust.

8205 Short Coat, 34 to 42 bust.

8111 Boy's Shirt, 6 to 12 years.

7608 House Jacket with Fitted Back, 34 to 44 bust.

No. 514 is a design for embroidering a square collar. The scallops on the edges are to be padded and buttonholed, the dots, flowers and leaves may be worked in solid embroidery or as eyelets; or the



leaves can be worked solidly with the flowers and dots as eyelets; or the dots only can be worked as eyelets. The stems are to be outlined. Stamped on pure Irish linen with mercerized floss to work, 25 cents.

A Farmers' Club.

Macomb is a township of large dairy farms in Northern New York. It has no railroad, no trolley line, no village of any size. When the children complete their eighth grade work in school they go 10 to 15 miles to a high school in an adjoining town.

These farmers felt the need of some social life to break up the monotony of their workaday world, and to attract the young people to the farm. The old-time huskings, quiltings, and apple parings are only memories of the older inhabitant. Rainy day visits are seldom indulged in, and the church attracts but few. The social need became so urgent that a call was sent to each home asking every member of the family, from the youngest to the oldest, to meet at the hall over the corner grocery on a certain Saturday evening. About 35 responded to the call. A chairman was chosen and the purpose of the meeting was stated. Permanent officers were elected, a committee was appointed to draw up a constitution and by-laws, and the Macomb Farmers' Club became a factor of importance in the community. It is now successfully launched on the fourth year of its existence. Meetings are held once in two weeks, on Saturday evening.

A program is presented at each meeting consisting of music, recitations, current events and discussions of farm or timely topics. After the program the young people play games or dance until 12 o'clock. There is a club picnic in August and several banquets and socials are held during the year. Some attention is given to dramatic work, and a play is presented each Winter. Last year prizes were given the boys for growing corn and potatoes, the girls for the making of bread and cake. The club has purchased a piano, song books, silverware and dishes.

While the president has general supervision of the club, the programs are made out by committees, thus keeping up the interest by giving each one in turn a share in the work. A kindlier spirit has grown in the community, feuds have been forgotten, and best of all, the club members have learned to work together for the common good. MRS. NETTIE C. ROYCE.

A Wise Woman Says:

"Neighbors are like members of your own household once removed, that is if they are the genuine article," remarked Mrs. Sage, when a question of rights and duties came up. "You can, of course, live next door to people for years, in the country as well as in the city, and not know their tastes in garden stuff or in wallpaper. You can bow and say good morning as you pass in the highway, always speak of them as excellent sort of folks, and never see the inside of each other's houses, or exchange opinions or views. That is a very safe way of dealing with the man and woman over the boundary fence; by avoiding all dealings with them you steer clear of chances for disagreement as much as possible. There are people as well taken on these terms; some have a little more money or breeding, and do not care for the simple, old-fashioned country demoeraey; others have so few brains and such crude ideas of manners as to make it impossible to admit an equality of footing. We are bound to meet reserve with good-humored letting alone, and we suspect that the keep-to-themselves people miss more than all their gains amount to.

"I am a firm believer in neighborliness, myself. That is a miserably narrow life where there is nothing to give and no desire to take. It does us all good to broaden out in sympathy, to laugh because another laughs, and to keep still because another wants to talk. There is some grist in almost every man's talk if our millstones are dressed to crack the kernel of his talk.

"When I urge that neighborly relations exact almost as much from us as do ties of blood I have in mind the patience, forbearance and charity necessary if we are to enjoy the people Heaven has given us to live among. We must take them for better or for worse, and we must not be surprised or discouraged when, now and then, there seems less of the better than we could wish. Take all things together, year in and year out, there is a surprising sum of good in even the neighbors who try our patience and make us wish sometimes that some one else might live next them. If we resolutely put annoyance and resentment far from us, and bravely endeavor to follow St. Paul's receipt as to whatsoever things are of good report, I believe there will gradually grow up in us that patience and charity that blesses him that gives and him that takes." A. T. S.

Seen in New York Shops.

Capes have come into style again and are to be the fashionable Summer wraps. They are half or three-quarters length, and very full, rippling all around the wearer; some are made so as to permit one end to be thrown over the shoulder. They have flaring stand-up collars, and some are made with an inner waistcoat of contrasting silk; others have inner straps like the golf capes worn so much a dozen years ago. With the small hats with high quills or pompons, swathing cloak thrown over one shoulder, and tight skirt below, the wearer's outline suggests an Italian army officer. These capes are made in broadcloth, silk and satin; some are cut quite low at the neck, with the flaring or falling collar, while others have high collars.

For outing and general wear the coats modeled after the Scotch and English Balmacaan waterproofs are in great favor, both for men and women. They are quite rippling at the bottom, with raglan sleeves; originally made in homespun or waterproof cloth they are now seen in a great variety of materials. This is a good model for a coat to slip over Summer dresses, like a sport coat, and may be made of heavy cotton or linen materials, such as brocaded ratine, golfine, cotton corduroy or duvetyne. We have a pattern for this style of coat, No. 8266, sizes from 34 to 44 bust.

Among inexpensive and durable petticoats for girls are those made of halcyon cloth, which cost $1; they are made in blue, green, brown and black, length 32, 34 and 36 inches. They are specially made for school wear. Among women's silk petticoats charming ones are made of what is called pussy willow taffeta, which is much softer than ordinary taffeta, and very lustrous. These petticoats, which cost $6.75 each, come in all fashionable shades, as well as black and white.

Wing-collar blouses of white lawn, which cost $2, had mannish little white lawn ties to hold up the collar. Vestettes of organdie or net looked like a pleated "dicky" coming down to the waist, with a stand-up collar and linen buttons. Some have a turn-down flaring collar, which lies over the coat collar; these are very pretty in pique. A black and white check jacket suit looks very smart with a white pique vestette and collar.

We have just become accustomed to the short flaring peplum or overskirt brought in by Oriental styles when something new appears—the Cossack overdress. This is a plain slightly flared tunic reaching to the knees or below, and is modeled on the long full-skirted overcoat, worn by Russian soldiers. With some of the excessively tight skirts worn below this full tunic, it requires a second glance to be sure that it is a skirt, and not a more masculine garment that is worn. In one very stylish model the skirt and little bolero jacket were of striped material, while the Cossack tunic was a solid color. It came below the knee, and was buttoned all down the front.

Tangerine is a vivid shade of deep orange that is greatly worn, not only in trimmings and millinery, but even in gowns and street suits. A tailored suit of tangerine crape cloth, made after an extreme and elaborate model, is rather startling in the bright sunlight of a crowded New York street. However, a little of this vivid color in millinery is very attractive, and is often seen on hats of dark myrtle green straw, which are plentiful, but not always becoming.

A Talk About Rolls.

When your dough has been kneaded down, and has become light the second time, rolled and drawn out into a long thin strip (see "Small Stuff," page 455) you may cut these strips into small even pieces of suitable size, and you are ready to make any of the various styles of rolls. Vienna rolls are made by rolling the small pieces into balls; these balls are allowed to stand until they become somewhat soft. When they are placed on the board they are rolled with the hands until about five inches long, about one inch thick in the centre, and the size of a lead pencil on the ends. Roll the ball of dough back and forth under the hand until it becomes the right thickness for the largest part of the roll. Then with the closed fingers of both hands start in the centre, roll the ends. As you roll gradually draw the dough lengthwise. Be sure that the taper is gradual, and that there are no broad bunches in the dough. Place the rolls on a tin far enough apart so that they will not touch each other when light. Just before putting in the oven wash them with milk and the yolk of an egg, and make three slantwise slashes across the top with a very sharp knife. In making this dough use half milk and half water with plenty of shortening.

In making finger rolls, which are nice for soups, make the balls about one-third the size of other rolls, and roll out into straight sticks about the size of a lead pencil. Do not allow these to touch each other on the tin, and bake well.

A bun dough is made in the same way as a roll dough, with the addition of currants, which are rolled thoroughly in flour and put into the sponge when light. There are two, or maybe more, ways of making up buns. Probably the method most likely to give satisfaction to the housewife, the way I make them, is to cut the dough, when light, into small pieces about the same size as for rolls. Roll these pieces on the board into long sticks about half an inch thick. Roll each of these sticks into a coil and place on tins. Place them on the tin rather closely with the end of the coil touching the side of the pan or the next roll in such a manner that they will not uncoil in raising. Bake in hot oven. If a frosting is desired they may be wetted slightly when taken from the oven and dusted with powdered sugar. Bakers us a syrup made from sugar and water, which is applied before going into the oven. But I have found this somewhat difficult to make.

Hot cross buns are made from the same kind of dough, with the addition of spices [currants and citron are also added. Eds.]. The dough is divided as for rolls, and simply rolled in round balls which are placed on the tins to raise. They should be well flattened down with the palms. The cross may be made with a sharp knife after they have been washed with milk and egg, just before going into the oven. If you would have good rolls or bread never wash your dough before it becomes light.

A BAKER'S WIFE.

Stale Bread and Cake.

There is never any stale bread or cake to go to waste in our household. Milk toast is our favorite way of using old bread, and I never allow a lot to accumulate, but make toast for supper or breakfast often. Left-over graham or whole wheat muffins can well be utilized also. Cut in small slices and brown thoroughly in the oven any time when there is a hot fire, care being taken that it does not scorch. The gravy may be made and set aside to be reheated. I often do these things while about the forenoon's baking. At supper time it is only a moment's work to heat the gravy, dip the toast in warm (not hot) water, arrange neatly on warmed individual plates, pour over the hot gravy, dot with bits of butter and serve at once. This is far more attractive than when served from one large dish.

Left-over cake, no matter what kinds or how many, if not too stale, makes a most delicious pudding. Cut in small slices. Make a filling as follows: One pint milk heated near boiling, beat yolks of one or two eggs with two heaping tablespoonfuls sugar, one heaping tablespoonful of cornstarch and a teaspoonful of water and pinch of salt; add to the hot milk and boil two minutes, stirring constantly. Cool and flavor with vanilla. Place a layer of the cake in individual dessert dishes (preferably of glass) cover with a layer of the filling followed by cake and more filling. Beat white of egg stiff, sweeten and flavor and spread over the tops. Dot with bits of bright jelly.

MRS. J.

NOVELS are sweets. All people with healthy literary appetites love them—almost all women; a vast number of clear, hard-headed men, judges, bishops, chancellors, mathematicians, are notorious novel readers, as well as young boys and sweet girls, and their kind, tender mothers.—William Makepeace Thackeray.

REGISTRY FOR PERCHERON HORSES.

I am located in Connecticut and desire information as to registry associations for Percheron horses. There are horses in Connecticut that appear to be recorded in an Ohio association known as the American Breeders' and Importers' Percheron Registry Company, John A. Forney, secretary. There are also some horses in this community registered in an association called the American Percheron Registry Association of La Grange, Illinois. There are also some horses here that are recorded in the Percheron Society of America. The last I know to be correct, as it is the Association that is recognized throughout the United States for Percheron horses, but I want to know what these other associations are, especially this association at La Grange. Can this association register a Percheron horse? Can they record a horse of Nivernais breeding as a Percheron? S. D. W.

There is but one association in the United States that is universally recognized for Percheron horses. This is the Percheron Society of America, located at Chicago, Ill. It is capitalized for $100,000, has more than 6,000 members, has registered also 100,000 animals, and has been in existence since 1876, and possesses all of the original books, records and documents back to that time.

The so-called Forney Association of Ohio has existed since 1905. They do not possess original books or records dating back of 1904. They recorded, until some time in 1906 at least, top-cross or graded-up Percheron horses. They are not recognized by leading stallion boards, by breeders generally, nor by foreign governments for purposes of export.

The so-called American Percheron Registry Association of La Grange, Illinois, was organized in 1905 for the express purpose of recording grade Percheron horses having three or more top-crosses of purebred sires. They have never been recognized for any other purpose other than for the registration of grade horses, have always been outlawed by all stallion boards, have no standing with breeders of Percheron horses, and, it is needless to add, have never been recognized by foreign governments for purposes of export.

There is probably no objection to the existence of a record for grade horses, but there is nothing in the certificates of pedigree issued by the so-called La Grange Association which would indicate to an uninformed party that the pedigree was for a grade horse, and because of this fact many such horses have been disposed of to unsuspecting purchasers as purebred, whereas they are not, and cannot be expected to breed with the same degree of prepotency that purebred horses do. Men who are unscrupulous enough to sell animals recorded in the so-called La Grange Association to men who believe they are buying purebreds are usually cunning enough to represent the animals, not as purebreds, but simply as registered horses, and in such cases the buyers have no recourse in law, for they are "registered" in an association which exists for the registration of grades.

New York and the New England States and some of the Southern States, have been particularly injured by the operations of persons handling such animals. Horsemen throughout the Central West are sufficiently well informed now not to be caught by stuff of this kind, but the men in the East and South, not so well informed, are frequently caught in some such manner. Within the past 10 days I have had a letter from a prominent business man in one of the Southern States who advises me that a horse recorded in the so-called La Grange Association has been sold in his town for a sum in excess of $1000. From information given by him relative to the case, I am satisfied that the horse was picked up in some of the communities where good draft horses are being bred, probably for $250 or $300, and taken south by some speculator who had first had him recorded in the so-called La Grange Association.

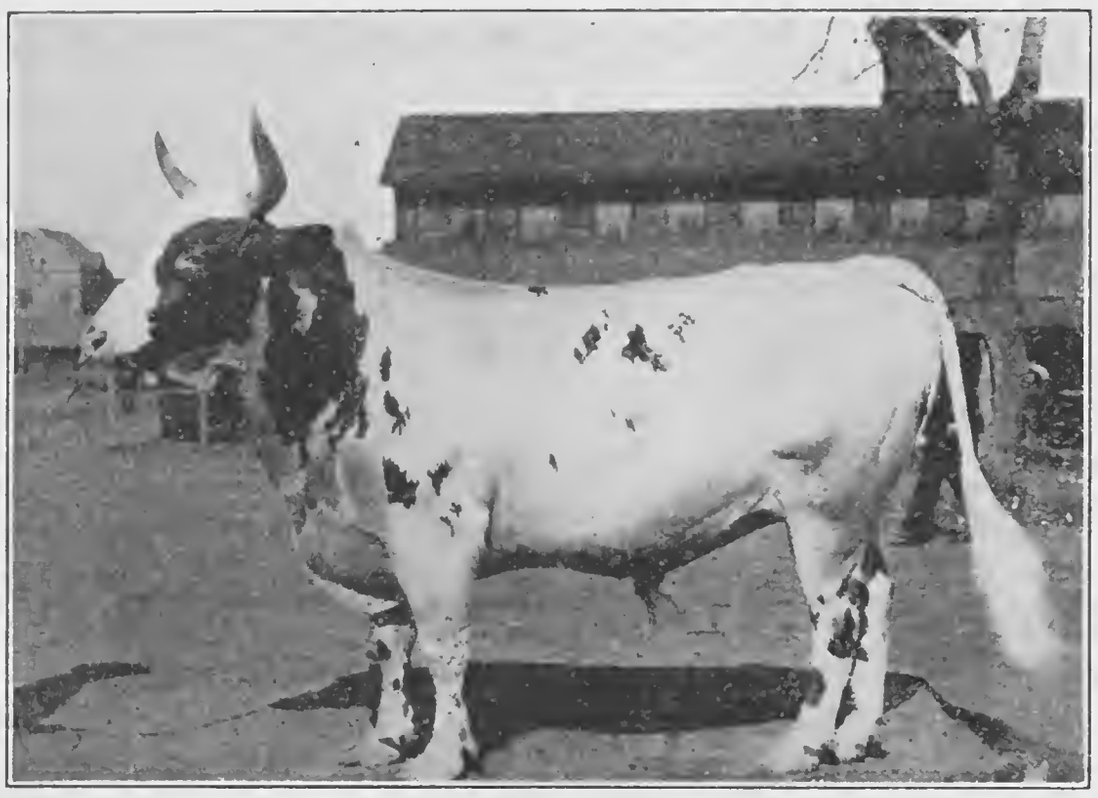
Summarizing the case for the protection of horsemen in the East, I may make this brief statement. Certificates of pedigree issued by the American Percheron Horse Breeders' Association, *numbered under No. 35912*, signed by S. D. Thompson, secretary, are valid. Certificates of pedigree issued by the Percheron Registry Company, Charles C. Glenn, secretary, are valid, but it is necessary to have the latter pedigrees rewritten or renumbered by the Percheron Society of America before produce from such animals can be recorded. This is because the Percheron Registry Company was taken over bodily by the Percheron Society of American in 1911. Certificates of pedigree of any number issued by the American Percheron Horse Breeders' Association or by the Percheron Society of America, signed by George W. Stubblefield or the undersigned, are valid.

WAYNE DINSMORE.
Secretary Percheron Society
of America, Chicago, Ill.

"LINE-BREEDING" AND "INBREEDING."

On page 505, a writer makes it appear that breeding a fowl "to his daughter would be called inbreeding; to a cousin, line-breeding." This is an error, and is exactly wrong as a comparison. Breeding sire to daughter is *line-breeding* as well as *inbreeding*. It is line-breeding with reference to the perpetuation of the male line. Breeding to a cousin is not line-breeding unless both parents contain the same blood upon one side, and that being the blood that it is desired to perpetuate. Generally the first step in line-breeding is breeding the male to daughter if it is the sire's line that is to be carried down the line. Of course if the mother's side is the one we wish to perpetuate the proposition can be reversed by mating mother with son. This would be line-breeding with reference to the mother. Any system of inbreeding that perpetuates the blood of a certain sire or dam for several generations is line-breeding. In line-breeding, if desired, the blood of sire can be made more and more predominant in succeeding generations while in other forms of inbreeding the original stock can be almost obliterated. To illustrate: An animal called "Sultan" is bred to an animal called "Fantine." The calf, a male, is mated with a heifer from a sister of Fantine, and sired by an animal named "Jumbo." This cousin mating would not be much like line-breeding. Now if this second calf was mated with another cousin not closely related to either "Sultan" or "Fantine" and so on for several generations, there would be very little of "Sultan's" blood in the progeny. So the breeder would not be line-breeding to "Sultan," nor would it be line-breeding to "Fantine," and yet it would be close inbreeding. Line-breeding to "Sultan" means keeping the progeny stron; in the blood of "Sultan," that is, line-breeding with reference to the male line. Line-breeding to "Fantine" means keeping the progeny strong in the blood of "Fantine." In line breeding the blood of one animal is infused more or less in every generation. Inbreeding does not necessarily do this. While line-breeding may include some new blood, it always carries a predominance of the blood of the animal whose line we are perpetuating. In one case the farther down the line we go the stronger the blood of that animal; in the other case, even by close inbreeding, the less of the blood of that animal will we have in the progeny. It is an interesting problem to note the number of combinations that can be made in line-breeding, and also in inbreeding without line-breeding. The reader will find out that we can breed the blood of "Old Sultan" into a strain in a few generations, or we can breed it almost out in the same number of generations and be inbreeding all the time. If the blood of "Old Sultan" predominates in your breeding stock you are line-breeding to him, otherwise, although you are inbreeding every mating your work may not be line-breeding. There are many ways of perpetnating a line of descent. Sometimes several yards or flocks are started from the same sire. These yards or families are line-bred with reference to the blood of that sire. Generations later an animal can be taken from one of these yards and used upon one of the other line-bred yards. This will avoid close inbreeding, yet it may be intensive line-breeding. W.
Michigan.

The distinction between inbreeding and line-breeding, as I have several times said, is one that is not clearly made by many writers using these terms; that made by W. is one that I prefer, but it is one that is not uniformly made by authorities, and is, in fact, quite contrary to some of the best. As evidence of this, I quote from "Principles of Breeding" by Davenport, as follows: "By line-breeding is meant the restriction of selection and mating to individuals of a single line of descent." * * * "It not only combines animals very similar in their characters, but it narrows the pedigree to *few and closely related lines of descent*. Line-breeding carried to its limits involves the breeding together of individuals closely related. When it involves the breeding together of sire and offspring, or dam and offspring, or of brother and sister, it becomes inbreeding, or breeding in and in. It is line-breeding carried to its limits. Three forms of *inbreeding* are possible among animals, namely, breeding the sire upon his daughters, breeding the dam to her own son or sons successively, breeding together of brother and sister. Nobody claims advantages in *inbreeding*, per se, but it is the acme of line-breeding, and when superior individuals are at hand it is the most powerful method known of making the most of their excellence. It is the method by which the highest possible percentage of the blood of an exceptional individual, or of a particularly fortunate nick, can be preserved, fused into and ultimately made to characterize an entire line of descent on both sides." Space will not permit further quotations but enough has been given to show that the statement criticised, viz., "Breeding a fowl to his daughter would be called inbreeding; to a cousin, line-breeding" is correct, even though not in accordance with some writer's use of these terms. M. B. D.



A GOOD SPECIMEN OF THE AYRSHIRE BREED.

CREONOID
Cow Spray
And Lice Destroyer
As the cows go out to pasture, spray them with *Creonoid* and they will bring back more milk, because they will not be tormented by flies.
Spray Creonoid in the hen-house and the hens will fatten, because they will no longer be irritated by lice. You can't expect profits from nervous cows or scrawny, irritated hens. Creonoid is very cheap and powerful.

Tailless Russian Sheep.

The lambs shown at Fig. 282 represent a breed of Russian sheep which Prof. Hanson and the South Dakota Agricultural College has imported. Prof. Hanson went to Siberia last Summer gathering a supply of the seed of Alfalfa varieties which seemed suited to our Western plains. On former trips he had frequently noted curious breeds of sheep, some of which appeared fairly well adapted to the cold dry sections of this country. Thus he brought back several specimens of the breed which is shown in the picture. They were first reported as being of the fat-tailed variety. This is a mistake, for these sheep have no tails whatever, and thus are different from Persian fat-tailed sheep, which are being bred in Texas and Kansas for fur-producing purposes. The sheep here shown, however, have the ability to lay on a great quantity of fat on the rear of the body. In time of drought or when food is short, they live upon this accumulation of fat. Prof. Hanson and the South Dakota Experiment people believe that this breed of sheep will find a place in this country, where it will prove useful when it has become adapted to local conditions. It is said that there are several other breeds of sheep in Russia which ought to be bred here for experiment purposes.

Inbred Horses.

Would it be advisable to breed a half-blood Percheron mare to her sire who has got uniformly good colts out of a mixed lot of mares, mostly of light weight? What are the drawbacks to breeding in that way? G. W. S.

Vermont.

Incestuous breeding is resorted to when it is desired to fix definitely certain characteristics that have accumulated as result of systematic mating. It is not recommended under conditions as suggested by G. W. S., and in my judgment it would be much better to mate this mare to an unrelated draft stallion in the county, rather than breed her to her sire. Inbreeding or incestuous breeding often times results in producing undersized animals, individuals with weakened constitutional vigor and vitality, and animals whose genitive system is often impaired. Deformed as well as undersized animals result, and it is not safe to breed as is suggested by your correspondent. Only the very hardiest and strongest individuals should be inbred, and then only when there is some one or more definite characteristics that it is intended to establish more permanently. Often with swine inbreeding can be practiced, since the bulk of the animals are marketed as carcasses when young, but for horses, particularly draft horses, the practice is to be discouraged. I think G. W. S. will get much better results if he takes this mare to the best unrelated draft stallion in his community, and that he should avoid the dangerous practice of mating a sire to his daughter. F. C. MINKLER.

Cribbing.

I have a young mare that I wish to breed this Spring. She cribs; will her colts be likely to learn it from her?

Pennsylvania. H. P.

Many hold that cribbing may be learned by imitation, and some even consider the tendency hereditary. We have never seen anything in practice to corroborate either belief. Breed the mare if she is in good health. A. S. A.

Lameness.

A mare has gone lame in front leg; it seems to be in fetlock. She is all right when standing in stable, but after a little drive she is very lame the next morning. After two or three days she is all right. She is 20 years old. She eats well and is in a good condition. J. L.

New York.

As often stated here, it is impossible for anyone to diagnose mysterious cases of lameness without making a personal examination and for that reason you should at once employ the local graduate veterinarian. A. S. A.

Garget.

What can I do for my Jersey cow? Her milk has pieces of yellow matter which seems to come from only one teat. She is hard to milk, teats are bloated and her flow is very irregular. These pieces seem like light colored butter, and when touched are of a slimy nature. Some go through the strainer of milk pail while some clog it and cheesecloth strainer on can seems covered with this matter. It does not affect the milk in any way, tastes natural, looks natural and stays natural. What would you suggest? I am selling the milk retail and have had no complaint and we use the milk for ourselves. X. Y. Z.

New York.

Such milk is absolutely unfit for use and the seller would be subject to prosecution under dairy inspection laws. It is quite possible that the udder is tuberculous and if so the milk is deadly for infants or young animals. The cow should be tested with tuberculin. If she is free from tuberculosis the affected quarter should be dried off and the milk from the other quarters only used if found to be perfectly normal in every way. Milk three times a day and then rub in a mixture of half an ounce each of gum camphor and solid extract of belladonna leaves rubbed up in half a cupful of lard. A. S. A.

Lameness.

Can anyone tell me what to do for a horse that has a sprained shoulder? I had a rowel in her, blistered her twice and is still lame. W. D.

Without making an examination we are unable to give a confident opinion in a mysterious case of lameness, but we think it quite likely that shoulder lameness is not present. Foot lameness is far more common. If the foot is thrust out in front (pointed) when the horse stands at rest the lameness is in the foot, and we would clip the hair from the hoof-head and blister it with cerate of cantharides twice a month until relieved. A. S. A.

BROWN SWISS CATTLE.—My attention has been called to an article on page 500 regarding Brown Swiss cattle. We have been breeding these cattle since 1877, and were interested with Mr. Scott of Worcester, Mass., in the importation of the second and third lot of these animals, which came to this country from their home in Switzerland. We have cows now being tested; one finished her year's test in March with a record of 14,145 pounds of milk to her credit. On page 501, near the close of the article on boarder cows, the writer says "it takes an immense amount of feed and excellent care to induce a *good cow* to produce 6,000 pounds of milk in a year." Our Brown Swiss have been giving us year in and year out at the rate of 10,000 pounds of milk per year with only ordinary care.

Connecticut. GEO. W. HARRIS.

PORK PRODUCTION FOR THE EAST.

How to Make Hogs Pay.

PART III.

GRAIN RATIONS. — The following named feeds are standard when it comes to feeding hogs. Corn, barley, Alfalfa hay, digester tankage, red dog flour, wheat bran and oil meal. This does not include waste products, but suggests feeds that may be used as a basis for successful feeding. The following rations are useful:

For brood sows before and after farrowing, cornmeal 100 pounds, digester tankage 12 pounds, wheat bran 10 pounds, oil meal four pounds, bone meal two pounds. To be fed in such quantities as would maintain a vigorous active appearance. A safe rule is to permit the brood sows to gain one-half pound daily from the time they are bred until farrowing time, gradually increasing the feed after farrowing, as the pigs demand more milk, until the brood sow is on full feed, all she will eat with relish.

For young pigs before weaning: Red dog flour 100 pounds, crushed seed oats 100 pounds, digester tankage 10 pounds. Fed in such quantities as the pigs will clean up readily at three feedings periods. This may be supplemented with a small amount of soaked shelled corn.

For pigs weaned until weighing 50 pounds: Soaked shelled corn or ear corn 100 pounds, red dog flour 50 pounds, wheat bran 15 pounds, digester tankage 10 pounds, skim-milk, four pounds of milk for each one pound of grain fed.

For market pigs, first period, three to six months of age: Cornmeal 120 pounds, red dog flour 25 pounds, digester tankage 10 pounds. Second period, six months to one year: Ear corn 100 pounds, digester tankage five pounds. This mixture should be fed to the animals intended for fattening purposes in such quantities as they will eat and clean up with relish. There is no advantage in grinding corn for swine. The tankage or red dog flour can be mixed with water or skim-milk, and fed as a thin slop. The use of Alfalfa, rape or clover pasture will materially cheapen grains during early growing and fattening periods. Soaked shelled corn and 5% of tankage added makes a fine feed for suckling pigs when fed in small quantities.

ALFALFA FOR SWINE.—The use of Alfalfa has practically revolutionized the swine industry, and it can be fed either as a green forage after it is two years old, or fed in the form of Alfalfa hay to growing animals, and especially to brood sows. The following precautions, however, should guide its use:

1. Alfalfa can safely be pastured with a limited number of swine, provided the animals are not allowed to crop the plants closely.

2. At least two cuttings for hay should be made during the season; the appearance of the crown shoots and blossoms suggesting the appropriate time.

3. The animals should be turned in at the outset, when the plants are from seven to nine inches high, and never allowed to make the field look like a regular pastured area.

4. Four brood sows with average litters may be allowed per acre at the outset, provided they are liberally fed a grain mixture and the number reduced as unfavorable conditions appear.

5. The period from May 1 to October 1 suggests the safe limits of the pasturing season; however, with due regard to season conditions, Fall sows with litters may be turned in for part days up to November 1st. The crop winters stronger if the plants are left about seven inches high.

6. If shotes intended for fattening or gilts for breeding purposes are utilized, a safe guide is suggested of one ton of live weight per acre. With ear corn and tankage, supplementing the forage, gains and growth will be most economical.

7. Based upon value of the pork produced, the labor saved, the amount of fertility added and distributed, and the health and type of the Alfalfa pastured pig, this practically supplies the means of obtaining by far the greatest income from an acre of this famous forage and hay crop.

Swine may be used to harvest the corn crop to advantage, provided the following points are given attention:

1. Enough animals should be turned into a field to clean up all corn in about 20 days, or approximately 20 125-pound shotes per acre.

2. Rape, clover or a combination mixture should be seeded in the corn at time of last cultivation to furnish variety and supply needed protein. Four pounds of rape and eight pounds of clover make a good mixture.

3. In case no green forage is available, a small amount of tankage should be fed in the form of a thin slop; five per cent. of estimated corn consumed.

4. The pigs should gradually be accustomed to green corn by cutting and feeding small amounts while in dry yards or pasture, else let in field for part days only at the outset.

5. The ears should be well glazed, and the stalks show evidence of partial maturity before the animals are let into the field; furthermore, the pigs should be taken out of the corn field on wet days and during muddy weather.

6. The hogs will gather the corn as clean as the average man at much less cost. Shotes weighing about 125 pounds are best suited for such feeding. Old sows are more wasteful.

FREDERICK C. MINKLER.

CO-OPERATIVE SOCIETY NOTES.

The most unique coöperative association recently organized in this State is the Newlots Coöperative Pasteurizing Company. Samuel Fish is president of this Company, and B. M. Gordon secretary and treasurer. They have subscribed and paid in on account of stock $3,500 of their $10,000 capitalization. This creamery is located in Greater New York, and it has seven original members, who have purchased this stock, and are building this pasteurizing plant; they own 629 cows. That men are engaged in the dairy business within Greater New York is in itself a remarkable fact. These men are all foreigners, and are making money; in fact they seem to be making more money than are the dairymen located in the most fertile valleys of this State. The coöperative form of organization appeals to these men very strongly, and they are anxious to take advantage of the new coöperative laws recently enacted.

At Hurleyville, the Jewish farmers of that neighborhood have organized a cooperative creamery. This creamery is financed entirely by the Jewish farmers of that locality. They have purchased a site and built a model creamery in all respects; Louis Billowitz is the manager. It is making a high-class, unsalted butter, and is making sales directly to the consumers in New York City. One of the newest features of their selling campaign is the division of the net profits of the creamery with the purchasers of their product. Each eight-ounce package of butter is wrapped in a paper, which at the end of the year is computed by the managers of the creamery to entitle the purchaser to share in the profits of the creamery. The stock-holders and members of this coöperative creamery receive 50 per cent. of the net profit; the employees 25 per cent. and the consumers of the butter 25 per cent.

A very enthusiastic meeting of farmers in the town of Whitehall was held April 10, at the Grange Hall in that village, where final steps were taken for the organization of the Whitehall Cooperative Company. Fully one-half of the farmers of the town were present at this meeting. Officers were elected; articles of incorporation were drawn up and signed, and the book for stock subscriptions was opened. This company will be incorporated with $1,000 capital stock, and $500 was paid in to the treasurer during this meeting. All of the subscribers have agreed to take five shares of stock at $5 each in this company, so that it may have ample capital with which to do a purchasing business. These farmers are almost all engaged in dairying, and through this new coöperative company i tend to buy all of their farm supplies. The local prices of the commercial kinds of feeds in Whitehall are extremely high, and by combining their orders these farmers are assured at the start of a saving of from $3 to $7 a ton on the feeds they use. For the first year the secretary, Edward D. Adams, is to perform the services of manager.

The South Shore Growers' and Shippers' Association, located at Dunkirk, N. Y., which has a membership of 700, the Chautauqua and Erie Grape Company (a company which markets about one-fourth of the Chautauqua County grape belt crop) and, the Keystone Grape Company of North East, Penna. are about to organize a large coöperative company. Nearly all of the farmers in this locality, bankers, and merchants in general, are deeply interested in this movement. The Bureau of Coöperation in the Department of Agriculture has received several letters from bankers and business men in this locality urging the formation of some such large coöperative company to assist in marketing more directly not only the grapes of the Chautauqua and Erie fruit belt, but all sorts of farm produce. A large meeting was called at Westfield on April 11 at which the tentative by-laws were carefully gone over with the assistance of the Superintendent of Coöperation and a committee was appointed with one member from each township whose duty was to solicit stock subscriptions. George E. Pierce, of North East, Penna., L. R. Dean, of Brockton, S. J. Cook, of Sheridan, Mr. W. N. Slauson, of Silver Creek and Fred Johnson of Westfield are members of this committee. It is hoped that before the next meeting, which is called on April 25, this committee will be able to secure the necessary stock subscriptions, and the membership in the company of at least 50 per cent. of the entire number of grape growers in the Chautauqua grape belt.

CRAINE SILO

IT CAN'T COLLAPSE

The Craine Patent Triple Wall Silo has thick vertical wooden staves, inside; horizontal patent wooden covering thoroughly nailed, outside; and water-proof felt-like rubber roofing between. This makes a perfect non-conductor of heat. SCIENTIFIC in every feature of its construction.

IT'S FROST-PROOF
AIR-TIGHT PERMANENT

No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

Feed Ensilage This Summer When Pastures Get Low

To secure the maximum results, stock should be fed green feed all the year round. Its succulence produces rapid growth and a heavy flow of milk. No other feed equals ensilage in succulence. It is as valuable and economical to feed in summer as in winter. It pays, then, to fill a silo for summer feeding. You will keep ensilage succulent and palatable all-the-year-round as the day the corn was cut, if you have a

Natco Imperishable Silo
(Patented)

Built of non-porous vitrified-clay hollow blocks; its glazed surface excludes air and moisture. The two dead air spaces protect contents from heat and cold. Each layer of blocks is reinforced by continuous steel bands.

Weather Proof — Decay Proof — Vermin Proof — Fireproof

The Natco Imperishable Silo will last for generations — any mason can erect it — never needs painting — walls will not warp or shrink — no hoops to tighten — no continual repair bills — the first cost is practically the only cost. The Natco Imperishable Silo has a survival value unequalled.

FREE SILO BOOK. Full of information about ensilage and summer feeding. Describes completely the Natco Imperishable Silo. Write today. Ask for catalog "L."

Products, Prices and Trade.

PRODUCE RECEIPTS AT NEW YORK.
Week ending April 30.

Butter, lbs.	2,541,160
Eggs, doz.	4,433,640
Apples, bushels	74,775
Potatoes, bushels	255,790
Hay, tons	7,278
Wheat, bushels	539,560
Corn, bushels	23,000
Oats, bushels	530,800

Wholesale Prices at New York,
Week Ending May 1, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high-scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 5¼ to 5½ cents per quart. Two or three large milk concerns in New York are working up new restaurant trade on the basis of $1.85 per 40-quart can.

BUTTER.

An advance of one-fourth cent has been made on the better grades of fresh creamery, though trade is light at this figure and buyers very critical as to quality. The proportion of high scoring creamery is smaller than usual. Packing stock is rather scarce, and there is a fairly active market for factory and process.

Creamery, extra, lb	25½@ 26
Good to Choice	22 @ 25
Lower Grades	19 @ 21
Storage	17 @ 22
State Dairy, best	24 @ 25

*

About 3,000 carloads of Bermuda onions will be shipped from Texas this year. The cabbage and lettuce marketed thus far amounts to 2,000 cars, and there will be at least 4,000 cars of new potatoes.

*

Two interesting definitions were recently given by eminent authorities. The N. Y. health board describes sausage as, "a comminuted meat from cattle or swine, or a mixture of such meats, either fresh, salted, pickled or smoked, with or without added salt and spices, and with or without the addition of edible animal fats, blood and sugar."

The other definition concerns the stringless bean canned, which, according to the Government agricultural authorities, is "any young bean processed so young as to have escaped having its strings get tough."

*

In a New York restaurant of the type where the customer gives his order at a counter, the counter man shouting it through a window to the chef and his assistants, is a man of all work called Tony. Counter men, assistant managers, etc., are frequently changed, for reasons satisfactory to them or the boss, but through all these various dispensations Tony stays on the job. He can scrub the floor, wash dishes, clear the tables, dress the window and wait on customers, and he is an artist at making two-story shortcake, with the strawberries set like little steeples on the ground work of beaten egg and sugar. In addition to all of this adaptability he has the rare accomplishment of not talking much, which adds materially to his value in a job where deeds, rather than words, are needed. W. W. H.

Fistula of the Milk Duct.

1. We have a young cow four years old which had one of her teats scratched in the pasture fence last Fall, when she had her calf by her side, and we never paid any attention to it. It healed up and now the milk leaks out of that one teat steadily. Is there any way that we could cure it? 2. We bought a city mare which had been driven without any shoes on and now she has the points of her hoofs from her hind feet all worn off. We had her shod and now she goes lame, but the hind ones worst. Could you give us any advice about this case?
New Jersey. J. L.

1. When the cow is dry have the fistulous opening closed by operation, or by cauterizing with a red hot knitting needle or other instrument. Better have a qualified veterinarian do the work. Meanwhile bind a strip of surgeons' tape around the part. 2. As soon as the ground is soft remove the shoes and turn the mare to pasture for the Summer. Once a month blister the hoof-heads with cerate of cantharides, after removal of the hair. This will stimulate growth of new sound horn. A. S. A.

NO GRAIN IN THE STRAW

The famous Farquhar principle of separation gets all the grain. No salable seed lost in the straw. The E. W. Ross Co., Box 113, Springfield, O.

Stop Your Cream Separator Losses

DAY after day you are leaving cream in the milk that goes to the hogs—because you are not turning the crank of your separator at the right speed. The Stewart Speed Indicator makes you crank properly and saves all this cream. (You can feed your hogs better on food that costs less than 30 cents a pound.)

The cream you are now throwing away amounts to many dollars a month. If you don't think so, listen to this:

Actual tests at Purdue Experiment Station proved that one dairyman with 20 cows lost $524.10 in one year by "guessing" at the speed he turned the crank.

Another dairyman owning 8 cows says he lost $18.50 *in one month* because he "guessed." The

Stewart Speed Indicator for Cream Separators

goes on the crankshaft of your separator and shows the exact speed you are cranking. Just tell us the name of your separator, its number, and what year it was made. We furnish the Stewart Speed Indicator on a new crankshaft that will fit. (If yours is a De Laval, then no extra crankshaft is necessary.)

Price $10—30 Days' Trial

Order from your dealer or direct from us. The price—complete—is $10 only. If it does not increase your cream production within 30 days return it and get your money back.

THOUSANDS of farmers now own International cream separators. They separate the milk at milking time when it separates best. Once or twice a week they have only the cream to take to the creamery and the fresh, warm skim milk builds up fat, healthy pigs and calves. They save slow and wasteful skimming by hand and save many creamery trips.

Buy an International cream separator—Lily, Bluebell, or Dairymaid, and get longest wear and best service. Experts design and build International separators. They build them strong, perfectly adjusted, and easy to operate. Note for example the low supply can, the high skim milk spout, the strong sanitary open-base frame, and such interior perfections as the tool steel spindles, the bronze bushings, the spiral gears, etc.

If you will write us we will send you illustrated catalogues telling all about International cream separators. If you do not know who sells them we will tell you where they may be seen.

Lousy Poultry Can't Pay

Lice-infested poultry are a constant loss to the poultryman. Lice suck the rich lifeblood from poultry, stunt the growth of young chicks and rob you of your well earned dollars. These pests reduce the hens' laying ability. Buy an effective louse killer and use it liberally.

DR. HESS
INSTANT LOUSE KILLER

Kills Lice Instantly. Sprinkle it thoroughly on lousy hens, rub it well under the wings and neck, put it in the dust bath, in the nests, roosts and cracks. Instant Louse Killer also kills lice on farm stock, bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes. Comes in handy, sifting-top cans.

1 lb. 25c; 3 lbs. 60. Except in Canada and far West.

If not at your dealer's, write—

CALEB BOGGS & SON, - Cheswold, Delaware

The Henyard.

Two-story Henhouse; Family Churn.

I have a two-story building 16x26, which I would like to utilize as a brooder and laying house. Can you recommend any suggestion? Also do you know anything about the Ott system of poultry "flats." Is it practical? 2. Can you recommend any family churn? F. W.
New York.

1. Two-story houses for poultry do not seem to have met with permanent favor, and are seldom built now, I think. You can doubtless utilize yours by arranging it so that the fowls may have access to the upper story for roosting quarters, and leave so much of the lower floor as is needed clear for the brooders. I am not acquainted with the system of poultry "flats" that you mention but have never known of any other than a one-story building being permanently adopted as the proper type for a poultry house.

2. A simple churn of either the dash or barrel type is to be recommended. My own preference, where the cream from only one or two cows is to be churned, is the old-fashioned dash churn of proper size. A barrel churn works much more easily, but requires considerably more time in churning, at least, in my experience. If this type is chosen, it is well to get one somewhat larger than the rated "cow" capacity. This will give more room for concussion of the cream in churning and will hasten the operation. M. B. D.

Dry Brewers' Grains for Poultry.

What is your opinion of dried brewers' grains vs. wheat bran in making up dry mash for poultry? I know a farmer in this vicinity who keeps a flock of mixed fowls and during this season feeds considerable "beer grains" (not dried) with the result that his egg yield is exceptional. I have given close attention to the various mash formulas, wet and dry, but do not recall any instance where brewers' grains have been used or recommended. Have you any data of interest or can you see any harmful results in the use of this feed? If not I am inclined to experiment a little and will later let you know the effect. A. C. T.
New Jersey.

I have never known of dried brewers' grains being used in a mash for poultry; neither do I know of any reason why they should not be if hens will eat them without waste. I doubt if hens would take kindly to them in dry mash, because of their light hull-like character, but trial would soon settle that. They rank considerably higher in protein than wheat bran, and I am now using them with considerable satisfaction to lighten up my horse and cow feed of cornmeal and oil meal. If hens like them they should prove a valuable source of protein in their rations. M. B. D.

Lice on Poultry.

Can you tell me of a remedy to rid poultry of body lice? I have read that they do no harm, and the poultry, if given a chance, will keep them down. My houses are perfectly sanitary, droppings removed daily, litter frequently changed, entire house and nest boxes sprayed often, and as often as once in two weeks I dust them with powder. I have used all the different brands, but they are all alike, merely check the pests. Recently on 100 hens I have used three pounds; result the same. This treatment, to say nothing of the labor expended, is becoming expensive at 25 cents per pound, and I am afraid it will soon exceed my feed bill. W.
Maine.

The effort required to keep poultry entirely free from body lice would probably not be profitably expended, even if it were possible to do so. If nests, perches, etc., are kept from becoming the hiding and breeding places of vermin by occasional applications of insecticides like kerosene and crude carbolic acid, and the hens themselves are given opportunity for frequent dust baths, vermin will be kept within bounds and will do no appreciable harm. The Lawry lice powder, made according to the following directions, is cheap and efficient: Spread 2½ pounds of plaster of paris in a shallow pan; pour one-quarter pint of crude carbolic acid into a cup, and add three-quarters pint of gasolene. Pour this mixture over the plaster of paris, mixing thoroughly. Rub through wire window screen; allow it to stand for several hours until entirely dry, but away from a stove or light. Keep in a closed can or jar, and apply through a sifter or with the fingers, working it well into the feathers, especially about the vent. A very little of the powder is sufficient for a fowl.

M. B. D.

Day Old Chicks
and
Six to Eight Weeks Old Pullets

6 weeks old 60 cents
8 weeks old 70 cents

Kirkup's Strain S. C. White Leghorns bred for size, vigor, and large white market eggs—$15 per 100—$62.50 per 500—$125 per 1000—Safe delivery guaranteed. **Order Today.**

THE EGG-LAYING CONTEST.

The twenty-fifth week of the contest, ending April 24, shows a gain over last week of 92 eggs; the total being 3,682. The S. C. Reds of A. B. Brundage, President of the Connecticut Poultry Association, tie with the White Leghorns of pen 41 from Storrs Agricultural Station, for first place for the week; each pen laying 56. Five pens compete for second place, with scores of 55 each. They are Frank L. Tuttle's Barred Rocks, Waveny Farms Barred Rocks, the Columbian Wyandottes from the National Columbian Wyandotte Club, Francis F. Lincoln's White Leghorns and Chas. Heigl's White Leghorns.

A. B. Hall's pen of Barred Rocks ties with pen No. 42, Storrs Station's White Leghorns, for third place, each scoring 54. The weekly score and the totals are given below:

The Hawk and the Hen.

I am greatly harassed by hawks preying on my poultry. Will you give me any plans to counteract them? I have tried traps on poles and tried scaring them by shotgun, which seems to have very little effect on them. I intend to put strychnine on the necks of one-day chicks. I lose about two-thirds of all my poultry every year by these pests. I am the only one about the farm to handle a gun, and I cannot watch them for days as some do. W. H. D.

Maryland.

I am afraid that you will have to work your problem out for yourself, for there is no good sure way so far as I am aware, by which you can rid yourself of these pests. Assuming that the small growing chicks are the ones caught, you might combat the hawks by some if not all of the following means. Raise the chicks near buildings where they can be watched. Use a gun on hawks prowling about the yards whenever you can. Clean away all the hiding places so that the hawks can't slip up on the chicks so slyly. Train a dog to watch and drive them away. Keep guineas, which are very alert and will give an alarm. Destroy the nests of hawks if they can be located. Keep chicks in covered runs when small, if necessary. Certain breeds like the Leghorn are very alert and learn very quickly to make themselves scarce when any of the larger birds come around, and you may wish to use these. Some breeds are protectively colored, and some such breed should be kept where hawks are bothersom. White birds make a fine target for any of these enemies.

It is claimed by some that quite large doses of nux vomica, which is strychnine in crude form, will not kill fowl on account of the arrangement of their digestive systems, but smaller doses will kill hawks. They also claim that one of the first parts of a bird that the hawk eats is the crop, and that if a dose of nux vomica is given in the feed of the birds any hawk that catches one soon after gets a fatal dose. You might try the poison with one and stake him out where Mr. Hawk will get him.

ROY H. WAITE.

Maryland Experiment Station.

Sickly Chicks.

What is it that is usually responsible for the abnormal development of most chickens raised in brooders indoors before it is possible to get them on the ground? It is a common experience to observe such chickens, as they approach the age of three or four weeks, give way to "leg weakness," unnatural feather growth, indications of vertigo, etc. Under like conditions of feed and care, with the exception that the chickens have access to the ground and the open air, development is satisfactory. What is the cause?

New York. E. W. B.

I do not know that any other explanation of the lack of thrift and vitality in house-reared chicks, as shown by leg weakness, etc., can be given than that such confinement deprives them of the natural conditions which are essential to growth and strength. It has been found that human babies do better out of doors, and many have to be kept there to save their lives. It is not strange, then, that young chicks whose immediate ancestors have not been made house-proof by generations of close confinement cannot endure such artificial conditions. I have no doubt that a race of fowls might be produced by generations of life and breeding in confinement that would thrive indoors and wither out, but with those we have, the natural life is the outdoor one.

M. B. D.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

The General says:-

There is no *beforehand test* by which you can know how long a roof will last.

But when you buy

Certain-teed

ROOFING

you *also* buy the responsibility of the three biggest roofing mills in the world—to make that roofing *make good* for 15 years at least.

See that *Certain-teed* label is on every roll or crate.

Your dealer can furnish *Certain-teed* Roofing in rolls and shingles—made by the General Roofing Mfg. Co., *world's largest roofing manufacturers*, East St. Louis, Ill., Marseilles, Ill., York, Pa.

Cheap Roofing a Bad Bargain at Any Price

A roofing not much more expensive than tar paper is *not much* better—a cheap price means a cheap roof, no matter what the "eager" salesman tells you; he is looking out for his pocket, not yours.

"RAIN-TIGHT" Rubber Roofing

is composed of **Trinidad Lake Asphalt**—The Standard asphalt of the world—no other "Secret combinations" that sound "big" but mean little. Nature made it, and took her time about it. That's why it lasts. Our brand of **"Perfect Roofing"** is the same as **"Rain-Tight"** with mica flakes added to the surface which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof.

PERFECT ROSIN SIZED SHEATHING AND PERFECT TARRED FELT ARE BEST FOR SHEATHING PURPOSES

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us today.

MAURICE O'MEARA CO., 448 Pearl Street, New York City

RHODE ISLAND REDS

The famous Vibert flock of beautiful, brilliant, glowing cherry to mahogany red-to-the-skin rose and single comb thoroughbreds. Not uncertain layers mated to males from uncertain layers, but specially selected, long backed, low tailed, certified trapnested record layers, scientifically line bred along Government lines for heaviest winter egg production, with yearly trapnest laying rates of 211 to 267 eggs; bred away from broodiness, and mated to large, vigorous, brilliant red males out of heaviest trapnest record layers. Heaviest winter laying, large, hardy Reds in America, hen hatched and raised, on absolutely free range, in wide-open front colony houses, on a scientific plant absolutely free from roup and white diarrhoea. Highly fertile, clean, well shaped, unblemished eggs, gathered hourly, shipped daily, delivered when wanted, guaranteed unbroken. Vibert Vitality Day Old Chicks. Splendid breeding cockerels from trapnested hens, trios, mated breeding pens for sale. Prompt shipment, safe delivery all over North and South America, courteous, strictly upright dealings. Mating booklet upon receipt of stamp.

VIBERT RED FARM, Box 1, Weston, New Jersey

GERMOZONE'S Big Value

is not so much in its great efficiency as a remedy for roup, canker, chicken pox and other diseases of poultry, but it is the greatest bowel regulator in the world for either poultry or stock (including pet stock), counteracting, especially, bowel troubles due to musty, spoiled or improper food. With man, fowls or animals, regular bowels means health. Continued irregularity means some sickness, difficult to cure if not fatal. Thousands give Germozone regularly twice a week to chickens, young and old, at the same time having it ever handy as a ready remedy for other diseases. Sold by dealers or postpaid. One size only, 50 cents.

GEO. H. LEE CO., OMAHA, NEBR.

PUBLISHER'S DESK

My mother, Mrs. M. J. Warren, who is now 84 years of age, was induced by representations through the mail, and by agents, to pay in to the E. G. Lewis concern of University City, Mo., sums of money covering a period of five or six years. A payment of $52 was made, which payment was completed in 1910; this sum of money was obtained from my mother by representations that if she joined the American Woman's League she would be entitled to a home as long as she lived; the home was to be completed in three years from the time of her final payment of the membership fee.

Lewis induced my mother to return to his institution all papers and correspondence that had passed between his concern and her, even to the money-order receipts that she had saved. All my mother has to show for the money she paid into the "American Woman's League" is the inclosed certificate No. 21648, and a letter dated June 21st, 1911. I am in poor circumstances myself, and my mother needs a great deal of care and attention. If there is any possible way that this man can be made return this money to my mother, I will greatly appreciate the same. M. D. S.

Michigan.

The women of the country sent Lewis over a million and a half dollars of money on this scheme. It is in evidence that during the time he was receiving it, he was losing $50,000 a month trying to publish cheap papers. He had to keep the papers going in order to keep the scheme going, and the money flowing in. In all his schemes he got ten or twelve millions, and it is all lost to the victims. Just now he has another scheme somewhere in California. If you have any money you want to put out on promises, Lewis will accommodate you any time.

A manual for quack doctors, telling them how to get the greatest possible amount of money from the largest possible number of patients, was found by United States Postoffice Inspectors today in a raid on the office of the Meyer Medical Company, whose proprietors were arrested on charges of using the mails to defraud. The manual tells how to hypnotize a patient and how to diagnose his physical and more particularly his financial condition. The instructions are devoted almost entirely to methods of getting money quickly and certainly. Much of the contents of the manual relating to diagnosis of the cases usually treated by concerns of this class is unprintable under the postal laws.

This description of the quack doctor manual reminds us of the Strout "Buggy-Seat Conferences," addressed to the local agents for the sale of farms. This Meyer Medical Company has another significant suggestion. E. G. Lewis was at one time connected with it in some way, and always referred to Mr. Meyer as one of the first-class citizens of St. Louis, who took stock in the Lewis companies and who went on the stand readily to testify to Lewis' good character, ability and good faith in separating women from their money. In other words, Meyer was one of the business men of St. Louis who confirmed Congressman Ashbrook and Secretary Redfield in the belief that Lewis might have been a millionaire if the postoffice had permitted Lewis to go on robbing women and children. After hearing the Meyer testimony, or maybe it was before hearing it, Mr. Redfield expressed regret that he was not in on the Lewis deals. Lewis will now no doubt testify to the good character of Meyer, and Secretary Redfield will have another opportunity to keep a promoter out of jail.

George F. Cole, engaged in the commission business at 131 South Market St., in this city, was arrested this morning by Deputy United States Marshal Ruhl on a warrant charging him with using the United States mails in a scheme to defraud. He was arraigned before United States Commissioner Hayes at the Federal Building this forenoon and held in the sum of $2,500. Cole, the Government alleges, sent letters to farmers throughout the New England States and particularly New Hampshire, stating that he was ready to buy poultry, butter and eggs as well as other produce, promising good prices. By this means, the Government contends, he was enabled to get shipped to his basement in the market district large quantities of produce, butter, poultry and eggs for which the Government asserts in its complaint he never intended to pay.—Local Paper.

Mr. Cole has had experience with the courts before. His trouble this time, it seems, grew out of a representation that a fire caused losses which made it impossible for him to pay farmers for goods consigned to him. His previous trouble grew out of an allegation that he caused notices to be sent farmers, who had shipped goods to him, that Mr. Cole was dead. We had many complaints against him some years back, mostly from Maine farmers; and we thought after the show-up of these complaints and the court record, that he would find few farmers again willing to ship goods to him. But this time he seems to have operated in another State. He says he might have made $100,000 if he had been dishonest. This would indicate that he found no difficulty in inducing producers to consign goods to him. He occupied a basement room in the market district.

I shipped 10 bags of beans to J. F. Wygant, Washington Street, New York, upon representation that he would pay $1 per bag for them. I have never heard from him. I do not expect you to recover but just give the experience for what it is worth. W. C.

The commission house claimed it lost 40 cents on this shipment, but as the report was not made until a year after the transaction, we could not work up much sympathy for the loss. The case was reported to the Commissioner of Agriculture, who now has authority to issue licenses or revoke them, and his view may be inferred from this later letter from the shipper:

On January 21 I received money order for $6.60 for the beans according to my claim, deducting for bags and expressage. Now I blame it all on you, for when I presented my claim I said I did not expect you to recover, but you went and did it, and you see the outcome. I am in $6.60. Many thanks to you. W. C.

The produce commission law and the Department of Agriculture were the principal factors in this settlement.

We do not know who is engineering the promotion scheme under the title of The Luther Burbank Society, Santa Rosa, Cal., but he is a star performer. He is certainly capitalizing the Burbank notoriety for all it is worth. The scheme was first worked on the life membership dodge, each subscriber pledging himself to pay a handsome fee for a set of books. Then an honorary membershhip was skillfully provided in ways to give no suspicion of what was coming, but now these "honorary" members begin to cry, so we are told, for recognition, and a plan is proposed to permit them to contribute $81 to the success of the scheme. What will be next we do not know, but opportunities for further contributions are not improbable. Indeed, we think them quite certain.

In the drugstores and other shops of New York alleged Burbank seeds are sold at $1 a bunch, containing 12 packages. Inquiry at reliable seeds stores reveals the fact that with one exception these 12 packets contain about one-half the amount of seed put up by responsible houses in each packet. In the Burbank collection you get 12 packets for $1. These seed packets usually retail for 10 cents each, but when put up by the reliable houses the packets contain about double the amount of seed. Besides, from the reliable houses you are sure to get carefully grown and tested varieties of seeds. From a concern with a scheme you are always guessing. I would not take chances on them if the seeds were a gift.

Dr. Julian P. Thomas, head of the J. P. Thomas Natural Food Company, of 522 West 37th St., who calls himself the inventor of the only sure remedy to cut the high cost of living, was arraigned yesterday before United States Commissioner Houghton and held in $5,000 bail on a charge of using the mails to defraud. Edmund Honvery, a postoffice inspector, complained that Dr. Thomas wrote to him urging his treatment for an ailment after the inspector had feigned symptoms. The doctor said he had brought himself to such a state of physical perfection on a diet of one raw onion, half a tomato and one of his raw wheat biscuits that he could lift 2,000 pounds, and the diet, he said, cost him less than 5 cents a day. The inspectors said Dr. Thomas's gross revenue from his "factory" was $100 a day for the last five years.—Daily Paper.

It is alleged that Dr. Thomas received letters describing the ills of patients, and prescribed for them without seeing the patients. It is said that people describing normal conditions were also advised that they needed treatment, and that the fee was as high as $40. However this may be, the trade in raw biscuits seemed profitable. J. J. D.

UNITED STATES
Cream Separators
LEAD
Under Any Conditions

For the reason that:

There is as much difference in efficiency between U. S. Skimming Sections and all other skimming devices as between the Twentieth Century Limited (20 hours between Chicago and New York), and the average passenger train (25 hours).

The U. S. Bowl is a marvel of perfection because of its ability in the average dairy to save in closer skimming from $50.00 to $100.00 each year (15c to 30c each day) over all other separators, and because it can be cleaned in about one-half the time of other separators, and easily kept perfectly sanitary always.

The U. S. Separator is the only Separator having the non-rusting Nickel Silver Metal which is non-adhesive like glass or ivory, easier than other devices to clean by ordinary methods and immensely easier by the Mechanical Washer.

The 1914 Sanitary Liner for bowl chamber supplies the most sanitary equipment. Iron is quick to rust when milk touches it. This is why other separators become insanitary. Milk cannot touch the iron bowl chamber of the U. S. for the liner prevents.

The U. S. Separator separates thick cream when desired, and at the same time **skims clean.** This is a hard test, and under it all other separators skim poorly, and some clog. The advantages of thick cream are many.

There are many cream separators outside the class of so-called "cheap separators" which in reality, like poor cows, are "star boarders" because they have not the ability as has the U. S. to meet perfectly the variations found in every day conditions in the average dairy.

The U. S. Cream Separator is in a class by itself.

It holds the World's Record in the longest and hardest fought world's contests. This statement cannot be successfully denied for the proofs are on record.

100 LBS. The Many Uses of UNION CARBIDE and ACETYLENE

The Union Carbide Company is the largest user of industrial horse-power in the world. UNION CARBIDE is the granite-like material that yields acetylene gas. In the process of manufacture the power of Niagara Falls and the great rapids at Sault Ste. Marie is transformed into electric current, which in turn is changed into heat. This heat is used to maintain the highest temperature known to science in the hundreds of huge electric furnaces which turn out the Carbide.

The process of making Acetylene from Carbide is so simple it has brought this gas into world-wide use. Today tens of thousands of mine workers are wearing acetylene mine lamps on their caps—thousands of acetylene torches are illuminating big outdoor construction projects—tens of thousands of automobiles are equipped with acetylene headlights—thousands of factories and machine shops are using oxy-acetylene metal cutting and welding torches—thousands of acetylene lighthouse buoys illuminate our sea coast. Others light the whole course of the Panama Canal. And hundreds of thousands of country home families are using HOME MADE ACETYLENE for both lighting and cooking. The thousands of tons of UNION CARBIDE used to make this acetylene is purchased direct from the Union Carbide Company's warehouses located at shipping points all over the country. In the hundred pound drums in which it is packed UNION CARBIDE is as safe to ship, store and handle as coal. It won't burn and can't explode.

Marking Laying Hens.

If I use paint on white hens, one color for each month I see them laying, what would be the limit in number of colors to weed out in the end of 12 months? What do the laying contests show by trap-nesting, the hens that lay four or six months, lay as many eggs as those that lay eight or 10 months, or what is the average? L. E. S.

Lyndonville, Vt.

Of all the questions THE R. N.-Y. ever sent me to be answered, I think the above "takes the cake." If L. E. S.'s plan was carried out for a year, I would like to see the hens. They would be a lot of walking rainbows sure. I knew a man in Massachusetts who built fences across his henyard and kept his Barred Rocks from getting too fat by feeding in the farthest yard. When a hen got so fat she couldn't fly over the fence, she had to go hungry until she thinned down enough to fly over and get to the feed. But L. E. S.'s scheme is not quite clear to me. If he is going to paint a streak on a hen only once a month, how is he going to tell that the hen has laid all that month or not? As to weeding out those with the fewest colors on, that would depend on how close he wanted to cull.

L. E. S. asks "What do the laying contests show by trap-nesting? That hens that lay four or six months, lay as many as those that lay eight or 10 months, or what is the average?" Trap-nesting shows each day what hens in the pen have laid; each hen when taken out of the nest has her number marked on the egg, also a mark is made under her number on a sheet of paper; the number of these marks showing how many eggs she has laid in the month or year. Trap-nesting makes it necessary to go around about once an hour to release the hens that have laid, so that other hens can use the nests. If one has as many trap-nests as he has hens, it would not be necessary to go so often.

GEO. A. COSGROVE.

Disinfecting Incubator.

Will you please inform me what you think is best to use to disinfect an incubator? O. N.

Connecticut.

Obtain from your druggist or physician one or two tablets of corrosive sublimate each of which when dissolved in two quarts of water will make a 1 to 4,000 solution. Dissolve in an earthen or wooden vessel and wash the interior of the incubator with the solution. This is the strongest disinfectant available, but is a powerful poison and neither tablets nor solution should be left where children or animals might swallow them. A 5% solution of carbolic acid in water will answer the same purpose. This is also a poison but its odor makes its accidental ingestion less likely. A still more convenient method of disinfecting an incubator would be to purchase a small sized formaldehyde candle, such as is used to disinfect rooms, and burn that in the closed incubator. The interior should first be cleaned, however. M. B. D.

Poor Hatch.

I have about 100 pullets, in fine condition, are laying very well, but it seems their eggs do not hatch. I had two hens coming off, one got two chicks the other none. The eggs were all fertile and a full-grown chick in every egg. What can be the trouble? I started the incubator with 350 eggs before the hens were due. They are White Orpingtons. The shell does not come off the egg when boiled.

New York. E. H.

There is evidently a lack of vigor in your flock somewhere which prevents your eggs from hatching, though fertile. This may be due to the heavy laying of the pullets through the Winter, or, possibly to an excessive number of pullets with the males in the breeding pen; or the males, themselves, may be at fault. Close confinement of the flock and heavy feeding through the Winter also tends to lack of vigorous fertility in the Spring. As the season advances, particularly after you have turned your fowls out, this condition will probably improve, and you may get a better hatch from the eggs in the incubator than from those set earlier under hens. If it can well be avoided, eggs from fowls that have been closely confined through the Winter, and fed for egg production, should not be depended upon for hatching in the Spring. They may be fertile, but are apt to contain weak germs which can never develop into vigorous chicks.

M. B. D.

Stiffness in Hogs.

Fall pigs fat and doing well, all at once stiffen up and stop eating, grow poor and cannot walk. They were on cement floors with lots of straw, and are all of good registered Berkshire stock. Old brood sow that I showed at fairs last Fall lost all hair from her back; she has no vermin but is very smooth on the back, without a hair. I have fed prepared salt.

New York. O. F. C.

It is a mistake to give much salt, of any kind, to hogs. A pound of salt to each hundred pounds of ground feed used in making slop is enough in most instances. We have known of a number of cases where harm has been done by oversalting hogs, especially in pig. There is no need of such doping. Overfeeding and lack of exercise is the cause of stiffening and lameness in pigs and sows. Rickets is induced. Worms are a complication. Turn the pigs and sows out on green feed as soon as possible and in addition feed very light, laxative slop, if it is needed in addition to green feed. The sow may regain her coat if so treated. Fevered condition from heavy feeding caused the loss of hair, or you may have used too much kerosene to "slick" her coat at the fairs. A. S. A.

Lymphangitis.

Could you tell me what is the matter with my horse? I bought a mare about a month ago, she is nine or ten years old and she seems to eat all right. I fed her ground oats and Timothy mixed with clover, but as soon as she stands in the barn a day or so her hind legs swell in the joints. Her udder gets big and hard and there is a hardening of the veins of abdomen. She will eat all her feed, but eats slowly and when I use the curry comb seems in pain. S. F. N.

Ohio.

Have her teeth put in order by a veterinarian and then feed whole oats. Allow her a box stall in stable, but work or exercise her every day. Each time she comes in rub her legs dry and bandage them from feet to hocks. The swelling has resulted from attacks of lymphangitis (milk leg) and will not altogether disappear. A. S. A.

Feeding Brood Mare.

I have an 11-year-old road mare due to foal for first time about June 1. How should she be fed, driven and cared for both now and after foaling? C. B. T.

Maine.

Use the mare for light work to within a week of foaling. Let her occupy a roomy box stall in the stable, but never let her stand a single day without work or exercise. Feed whole oats, wheat bran and mixed hay. Do not feed grass if she is to work. If she has no work to do turn her on grass when it is ready, for an hour or so a day at first, and gradually accustom her to living on grass without other feed. Reduce the oats and increase bran as foaling time approaches. For foaling have the box stall cleaned out, disinfected and whitewashed and put in fresh, clean bedding on foaling day. Saturate the stump of the navel with tincture of iodine at birth and then keep it well coated with boric acid. Feed the mare lightly after foaling, and in a week she and the foal can go on grass. If she is to work she may return to it in three weeks, but must be worked only a part of a day for the first week, as she will be weak and soft. Each time she comes in hot and tired feed her a pound or two of hay in an ordinary stall while she is cooling off, and milk her almost dry before the foal is allowed to suck. Let the foal have access to cool fresh water at will, and as soon as possible allow it to eat oatmeal. Add wheat bran gradually, and allow grass and hay as soon as the foal cares to eat such feed.

A. S. A.

Milkless Sows.

What was the matter with this sow? She farrowed at proper time, 10 nice pigs, which tried to suck, but could get no milk. She looked as though she had plenty of milk. She farrowed with ease, was not sick, did not have milk fever or caked teats, and acted naturally in every way. She had been fed on oats and wheat; was not fat nor poor, but in good condition and had plenty of exercise until a week before farrowing, when I put her in a small pen by herself.

Alberta. A. R. M.

We take it that these were her first pigs, and if that is so it must be that the teats are "blind" (without milk ducts). Such cases have been met with, and in some instances may be remedied by operation. Garget may also lead to suppression of milk. Do not breed this sow again. A. S. A.

Garget.

I have a Jersey heifer that freshened February 21. Her udder was caked but by putting on hot or cold water and massaging the cake was nearly gone. The calf was chilled so we had to feed it and keep it where it was warm for a few days. Shortly after putting the calf with the mother (about three times a day) her udder in one quarter became discolored and swollen very badly. We had milked her partly out in the morning a few times. We tried rubbing again and got medicine from a veterinarian with the result that the quarter is still swollen some and thick. The skin is loose, though it does not seem to be sore, and the fever has subsided for about two weeks. Her milk has continued good. We have been rubbing it night and morning lately with sweet oil. Though I massage it well for 15 minutes it does not seem to improve it. What do you advise? G. W. M.

New York.

Massage three times a day with lanolin and each night with a mixture of one part of mercurial ointment and two parts of soft soap. If the enlargement is not due to tuberculosis, this treatment may do some good. It is well to test such cows with tuberculin. A. S. A.

Scratches.

I have a western horse nine years old, purchased last Spring. He had a scar in his left forward foot, where they told me he had been cut in barbed wire. Last Fall he ran a nail or dirt in the crack of his hoof in the same foot, below fetlock. I put carbolic acid on it, and the acid ran over this old scar; it cracked open and became sore, and he became lame. I took him to a veterinarian and he pronounced it scratches. He gave me salve to apply twice a day. I did so, and a week later the other foot became the same way. I applied the salve on both feet all Winter. He is much better just now; is not lame but a little stiff when he first comes out. The same disease is now starting in his hind feet. He is in good health. Would you advise me what to do for him? L. M. D.

Poultice the affected parts for three days with hot flaxseed meal changed night and morning. Then wash clean once, but do not afterward wash the parts. Washing aggravates scratches. After discontinuing the poultices apply twice daily an ointment composed of two drams of sulphur and one dram each of spirits of camphor and compound tincture of benzoin to the ounce of unsalted lard or lanolin. Keep the horse from standing in a cold draft in the stable. If the legs stock up when the horse stands over night bandage them snugly with flannel each time he comes into the stable and if possible allow a roomy box stall, in place of an ordinary stall.

A. S. A.

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. **THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.**

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

FARM SACRIFICE—Otsego Co., N. Y. 128 acres; artistic house, bath, furnace; farmer's cottage; numerous outbuildings; 18 high-grade cattle, pair fine horses, complete farm machinery. Appraised value over $10,600. Price, complete, $6,750. E. E. SLOCUM, 141 Broadway, N. Y. City

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

FARM FOREMAN, practical, life experience, married, references. E., Brewster, New York.

WANTED—Position on dairy or stock farm. 5 years experience. A-1 references. Address H. S. 125 Monmouth St., Red Bank, N. J.

WANTED—Partner on fruit, vegetable and stock farm. Excellent Summer home or boarding place. Address D. D. KNAPP, R. F. D. 20, Danbury, Conn.

YOUNG MAN wants position on high-class farm for Summer beginning June 12. One year in Conn. Agr. College. PERRY YOUNG, Agricultural College, Storrs, Conn.

FARM HELP—The New York State School of Agriculture at Morrisville, N. Y., can recommend several trained, practical young men. F. G. HELYAR, Director, Morrisville, N. Y.

WANTED—Married man as active farmer and assistant foreman; farm and orchard cultivation; state experience, qualifications and salary expected; give references. Address THE ORCHARDS, Bennington, Vt.

YOUNG MAN, 19, well bred, strong, good health, with already little experience, desires work on farm with good family, preferable around New York State. CHARLES MICHEL, 113 W. 111, N. Y.

WANTED—FARM GIRL for general housework, good wages, no washing. House of professor in College of Agriculture, Cornell University. State full particulars when applying. 408 Dryden Road, Ithaca, N. Y.

WANTED—Dairy hand, single, under 35. First class dry hand milker; able to run separators. $35 per month and board. Give particulars, age, experience; no booze or cigarettes. GLENFREW FARM, Sewickley, Pa.

HERDSMAN—Wanted (for Jerseys) also teamster. Good permanent position for first-class temperate, men. Non smokers preferred. For Sale—New John Deere Manure Spreader, bargain. E. R. DUNN, Southington, Conn.

WANTED—By small shooting and fishing club in Massachusetts, a young man to act as guide, take care of dogs and raise a few ducks and pheasants. No drinking men need apply. State age, experience, salary, etc. C. H. B., care R. N.-Y., 333 W. 30th St., New York.

POSITION wanted on farm by man willing to invest some money in farm or farm machinery. Good mechanic, experienced with tractors and gas engines. Would like opportunity to take a run down place and put it on a paying basis. B. C. E., care of R. N.-Y., 333 W. 30th St., New York.

FOR SALE—White potatoes, direct from farm, 80 cents bushel. WILLARD B. KILLE, Swedesboro, N. J.

WANTED—Used Prairie State Incubator, good condition. Address, ROBT. LAMATSCH, Carriers' Dept., Main Postoffice, New York City.

FOR SALE—A four and one-half and a thirteen and one-half horse power gasoline engine. Will sell for seventy-five and two hundred dollars respectively. ONEIDA COMMUNITY, LIMITED, Oneida, N. Y.

FOR SALE—Farm of 70 acres, well watered, good buildings, good wood lot, one mile from Railroad, stores, church, blacksmith, on mail route. L. L. SMITH, Westdale, N. Y.

FOR SALE—Chautauqua grape farm, 90 acres; splendidly situated; fine buildings; $2,000 down; liberal terms balance; description, photographs upon request. HARRY STANBURY, Forestville, N. Y.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

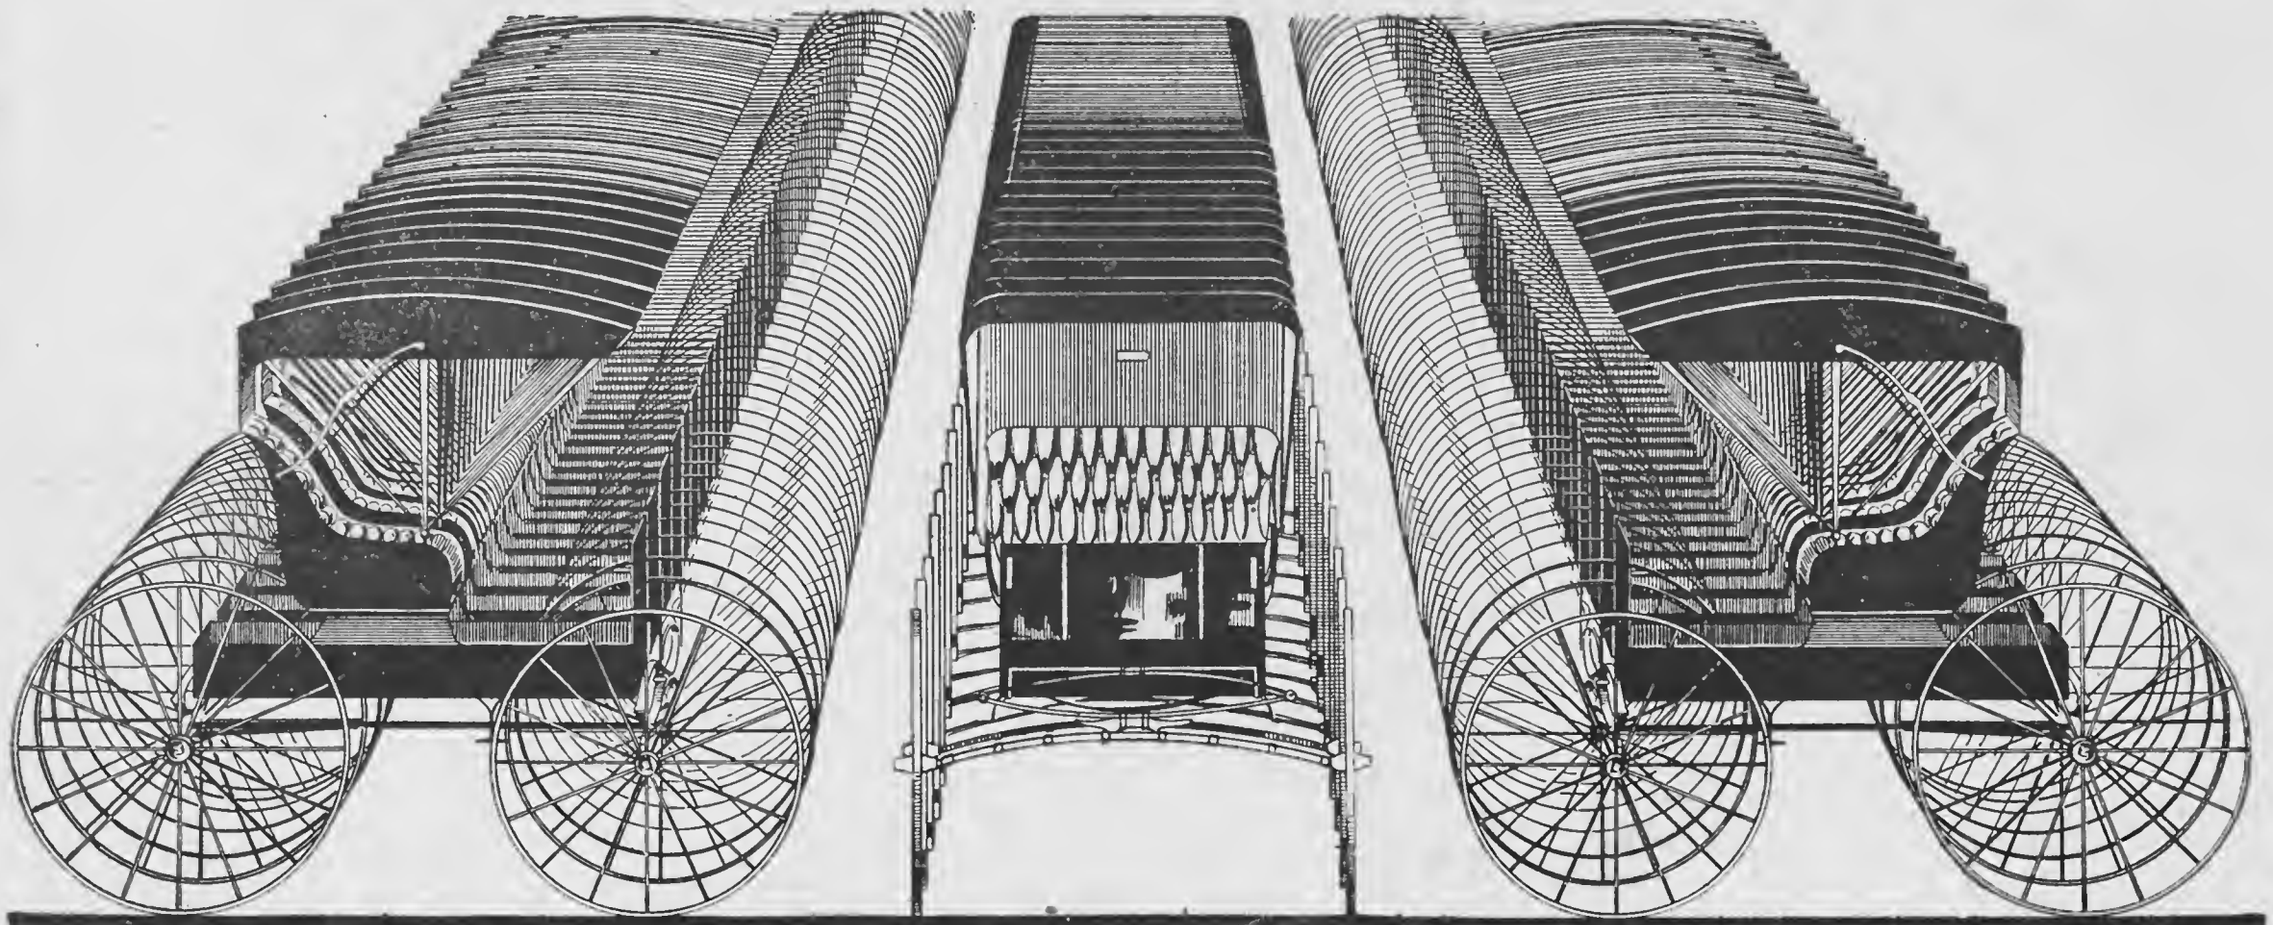
MODEL POULTRY FARM—Successful business proposition, fully equipped with thoroughbred stock; 35 acres; capacity 3,000; large dwelling, mile from railroad; profits will return 20 per cent. on investment; $15,000, part cash. BOX 256, Beverly, N. J.

FRUIT FARM FOR SALE—50 acres, near Bound Brook, N. J.; commercial plantings of peach, apple, grapes, berries, etc.; stone dwelling; furnace; tenant house; poultry plant, stock and implements; fine views; good roads and markets. Price $12,000. Address owner, T. W. AYRES, Fort Payne, Ala.

48 ACRES; 7 room dwelling, barn, 6 poultry houses; young orchard, 6 acres apples, 2 acres peaches and other fruits; good well and running water; one-half cleared, balance nice timber. Richmond, 11 miles. Store, station, postoffice ¾ mile. $3,000. $2,000 cash. HERMAN BOEHME, Meadow, Va.

FOR SALE—In most popular Summer boarding district. House with running water and all improvements, chicken house 60 by 14, capacity 300, four acres on Delaware River, good bathing, bathing and fishing, price $3,000; cash $1,500, balance ten year mortgage; fine opportunity. CHARLES EBERLIN, Parkers Glen, Pa.

FARM FOR SALE—Farm of 160 acres, 2 miles from McDonough Village, an excellent dairy farm; good market for milk; land lays level and is easy to till, and under good cultivation; buildings and fences are first-class and in good repair; 150 thousand feet of sawing lumber on the place, mostly hemlock. Owner wishes to sell on account of ill health. For price and terms call or address GEO. A. PURDY, Oxford, N. Y., or ALBERT BECKWITH, McDonough,



Want A Buggy?

Let Me Show You Bigger Bargains and Finer Buggies Than You Can Find In 40 Small-Town Carriage Shops Rolled Into One

LET me show you the immense array of superfine buggies—all splendid styles. Let me do this right away. All you need to do is to clip—fill out—and send in the coupon. That won't take 5 seconds. It will cost you merely a 2 cent stamp. And it *may* cost you $25.00 to $40.00 if you don't grasp this great chance to get posted on genuine, rock-bottom buggy *value!*

It makes no difference whether you want a buggy, surrey, runabout, carriage, phaeton, spring wagon or a set of harness—your duty to your pocketbook is to get this book—and *get posted!*

It makes no difference whether you're going to buy from me or anyone else—*get the book!*

Give yourself the treat of inspecting these 140 pages filled to the brim with 125 wonderful offers in the finest vehicles man can make—the most stylish, easiest running carriages money can buy.

This Book Will Tell You ALL

Let Me Save You $25.00 to $40.00

On The BUGGY You Buy! Nearly 200,000 Others will assure you that I can do this for you

Doubtless, scores who know *by actual experience* that I can save you that much hard cash *live right in your neighborhood!* Nearly 200,000 customers testify to that as fact. Nearly 200,000 men just like you know that I do save them the fat profits of the small-town dealer—whose buggy price must cover and include traveling men's expenses and salary, middleman's commission and carriage maker's profits. They got my book—and thus saved $25.00 to $40.00 on every buggy they bought. And you can do the same. And get

Split Hickory Vehicles

—the finest carriages that ever rolled over a road. Made of genuine Second Growth Hickory—*split*, not sawed. Constructed for service. Built for solid lasting *comfort*. Designed in the very latest 1914 styles. And *Guaranteed Absolutely For 2 Full Years!* And sent to you on an offer of **30 Days' FREE Trial On Your Own Roads!**

Nearly 200,000 men—farmers—merchants—horsemen—assure you that they have benefited by getting my book—and taking advantage of my plan. What they have done—you should do. Where they have profited—you will profit. And remember every Split Hickory Vehicle is

Sold On My Ironclad Guarantee For Two Years!

NOW—while you have a moment to spare—before you forget it—just clip off the coupon—fill it out with your name and address—and mail it to me. *GET THE BOOK!*

H. C. PHELPS, *Pres.*, The Ohio Carriage Mfg. Co. Station 290

Vol. LXXIII. No. 4255. NEW YORK, MAY 16, 1914. WEEKLY $1.00 PER YEAR.

CARBON DIOXIDE IN INCUBATION.

Bad Air in the Incubator.

[Bulletin 76 of the Connecticut Experiment Station contains a report of very long and patient work by Prof G. H. Lamson, Jr., in studying the presence of carbonic acid gas formed in incubators. There has been much discussion concerning the functions and the effect of this gas, and we may say that Prof. Lamson's work has solved the problem. The bulletin is a technical discussion of a chemical question, but Prof. Lamson has prepared for us a more practical statement—which follows.]

HEN VS. INCUBATOR.—The problem of artificial incubation has been the question of how we can hatch as many and as strong chickens in the incubator as under the hen. Some hold that the same per cent. and as strong chickens can be hatched in the incubator as under the hen, but this is not substantiated by those who have carefully experimented with artificial and natural incubation, and even the incubator manufacturers claim that their machines only approximate the old hen's ability to bring off good hatches and produce vigorous chicks. What the differences are between natural and artificial incubation and what the factor or factors that produce the different results are problems well worthy of considerable study, for great is the economic importance to the country if even a small increase can be made in the hatching efficiency of the incubator.

THE WOODEN HEN.—A temperature of 102½ degrees Fhr. during the first half of the period of incubation and 103½ degrees Fhr. during the last half of that period closely approximates the temperature found under the average hen. So with a level incubator, a reliable thermometer and a reasonable amount of care in looking after the lamp and thermostat, the temperature need not worry the incubator operator. By turning the eggs twice each day this function of the hen is taken care of as well as is necessary. If cooling is practiced according to the suggestion of the incubator manufacturers no harm will be done, at least, and the operator will approximate the hen's "out to lunch" periods. If these conditions are essentially the same as those found under the hen the factor making the difference between natural and artificial incubation must then be elsewhere. The next question comes: Is it in the moisture of the air or the chemical composition of the air?

MOISTURE.—Just what amount of moisture is necessary for the most successful incubation the writer does not profess to know. In most of the work on moisture the ordinary incubator hygrometers have been used to measure this factor, and these instruments are a delusion and snare as far as an accurate measurement of the humidity is concerned. There are as strong adherents of the moisture as non-moisture, and while some have had better results with one than with the other it is known that the chick embryo is able to withstand a wide variation of moisture and hatch. That there is an opportunity to get more light on the subject of moisture in incubation by the use of accurate methods is evident to anyone who has given this problem much thought.

"BAD AIR."—It is known that there is in fresh air a small amount (.03 per cent.) of a combination of gases called carbon dioxide or carbonic acid gas, and that this is breathed out by animals, the hen included, in large amounts from the lungs. It was believed by some that carbon dioxide was the factor that made the difference between the hen and the wooden hen, for the incubator could not breathe, but the fumes from the lamp were known to contain carbon dioxide and the question others raised was as to the possibility of there being more carbon dioxide in the incubator than in under the hen. To determine the truth about this question it was necessary to construct an apparatus that would have a ventilation that was entirely free from any fumes of the incubator lamp and at the same time have the temperature and moisture controlled. This necessitated various attachments which would not be practical in ordinary incubation or in the commercial incubator, for the aim was not to design a new incubator for the market, but to study these factors accurately and keep them under control. These incubators were sealed during the progress of incubation, except for a few minutes to test and weigh the eggs. The eggs were turned by a curved device on a circular tray, and the air was pumped into the incubator at the same rate during each hour through the process of incubation, and the air surrounding the eggs was tested by a chemist, Mr. H. D. Edmond, by whose ingenuity the construction of the apparatus was made a success. The work was carried on through the hatching season of five years and nearly 10,000 eggs were incubated.

THE CELEBRATED TOM BARRON WHITE WYANDOTTES AT THE STORRS EGG-LAYING CONTEST. Fig. 290.

AIR UNDER THE HEN.—The results showed early in the experiments that the chief source of the carbon dioxide was the chick embryo. With a hen sitting on boiled or china eggs the carbon dioxide under her was found to be small in amount. With fertile eggs in an incubator or under a hen the carbon dioxide increased slowly at first, and rapidly after the ninth day of incubation until it reached the maximum a little before the chickens hatched. This increase closely approximates the increase in the weight of the chick embryo. If the ventilation was slow and sluggish then the carbon dioxide increased more rapidly and reached a high figure compared with the incubator supplied with a rapid circulation from one quarter of a cubic foot to 15 cubic feet each hour during incubation, in other words by cutting down the amount of fresh air we allowed the carbon dioxide given off from the eggs to ac-

cumulate in large quantities and noted the effects upon hatching by increasing the rate of ventilation, but small quantities were present in the incubator.

THE LIMIT.—Possibly the easiest method of explaining the effect of carbon dioxide is to say that the normal fresh air contains three parts of carbon dioxide in 10,000 parts of air. When the ventilation was cut down to a slow rate the carbon dioxide reached over 500 parts in 10,000 and only about 12 per cent. of the fertile eggs hatched and half of these were crippled chicks, showing that amount was not good for the chicks. To find out how much carbon dioxide there was in under the hens during incubation the air was drawn through a wooden egg placed in the center of a nest (see Fig. 291) and the carbon dioxide usually reached 55 parts as a maximum. In order to duplicate this ventilation, the experimental incubators were run with five cubic feet each hour, and the results each time closely approximated the percentage hatched under the hen. It was found, however, that good hatches were had when the carbon dioxide went higher than this, but that they were reduced after the amount exceeded 150 parts. In the commercial incubators tested the carbon dioxide seldom exceeded 50 parts or closely approximated the conditions under the hen. The chicks hatched well in air varying in amount of carbon dioxide from 30 to 150 parts in 10,000 within the experimental incubators. The hen and the commercial incubators tested did not exceed these limits in any case. It was proved conclusively that the normal commercial incubator is not faulty in the amount of carbon dioxide. Mammoth machines were not tested. Carbon dioxide was added artificially, and it did not produce bad results until it occurred in large amounts.

DON'T WORRY.—Incubator operators need not worry about the carbon dioxide factor. If more was beneficial all that would be necessary would be to reduce the speed of ventilation. In case the operator has had very poor results with eggs from hens that are hatching well in other incubators and are known to be strong then he might do well to inspect his heater to find if any part had been bent in shipment and in case there was a defect have another supplied. Heretofore, the value of carbon dioxide in incubation has been a much debated point, some holding that it was beneficial to the developing embryo and others feeling that its presence in the fumes of the lamp was the reason for poor hatches. Incubator manufacturers not knowing its value or danger have experimented on the public by changing the amount of ventilation in their incubators and have even sought to increase carbon dioxide artificially, so that while the value of these experiments does not come directly to the poultryman it is hoped that they may in a measure protect him from being a future object for experiment.

Without holding any brief for the incubators or incubator manufacturers, experiments have shown that there is more liability of poor results in hatching from weak germed eggs than from any other source, and that it will be easier to hatch more chickens from eggs containing strong germs under poor incubating conditions than it will be to hatch from the weak germs under the most ideal incubating conditions of temperature, moisture and ventilation. G. H. LAMSON, JR.

ARE TOM BARRON'S HENS WYANDOTTES?

As it was a very serious question in my mind whether any "Standard" Wyandottes could make the unusual egg records which the "Barron" birds have made at both Storrs and Mountain Grove, I wrote to both Prof. Quisenberry and to Prof. Kirkpatrick, and asked to have an opinion on the "type" of these birds. Prof. Kirkpatrick sent me a photograph of the cockerel, stating: "I think as I see them they are considerably different from our American type of Wyandotte. *They are longer in body.*" I submitted this photograph to Mr. W. B. Atherton, the editor of the American Fancier and Stockkeeper, who said, "The bird is a Rhode Island Red shape and type, white, with a rose comb and poor carriage." Prof. Kirkpatrick wrote to me as follows:

I am pleased to advise that Judge W. H. Card visited us a few days ago, and I took the liberty of asking him to pass on Mr. Barron's Wyandottes, and am at liberty to give his opinion. I felt that perhaps as a judge his summary of the case might be a little more trustworthy than my own.

Unless I am in error, Card does not think Barron's Wyandottes would score 75 in the Boston show. He says they correspond more nearly with, and in fact, are almost typical Rhode Island Whites with their long horizontal back and body, that they are not true Wyandotte shape by any means. Card thinks furthermore that the little white in their ear lobes probably indicates Mediterranean blood, and they are also off in leg color. This may, however, be due to their excessive egg production. Card adds, however, that these birds are the most energetic, "snappiest" bunch of hens he has seen for a long while. They go for their food not exactly as if they were starved, but as if they were enjoying it and meant business.

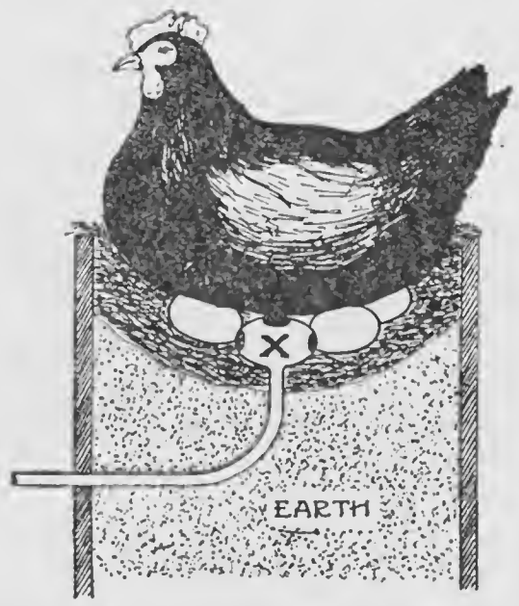
Mr. Barron deserves great credit for making a Wyandotte-Leghorn cross that will lay well, but what about the hundreds of innocent purchasers of this hybrid stock, who believe they have standard Wyandotte type?

I notice that Mr. Cosgrove and others report that the "Barron" Leghorns lay an off-colored egg. This would indicate the same White Indian Game blood that was crossed on Leghorn some years ago to correct the whitish legs coming from the Minorca blood used to give the old Leghorn size. Anyone who handled large flocks of Leghorns for commercial egg production, say 10 years ago, knows how hard it was to eradicate the off-colored egg layer, and as off-colored eggs cut the price on "fancy selected white" grades, some of the best looking and laying hens had to be disposed of. These off-colored eggs were never hatched and finally a white egg strain was established. There are several strains in the East that have been brought to as high an average as the Barron birds, but they lay a clear white egg.

New Jersey. BUCHANAN BURR, M. D.

Well, What Of It?

It will require the strongest evidence to convince us that Tom Barron has entered any "mongrel" or hybrid birds in this contest. There is no question about the ability of these Barron hens to lay eggs, and the sensible poultry keeper can easily forgive a hen which lays 200 eggs a year if her shape and clothes are not cut after the exact pattern. In order to get at the facts we wrote Judge W. H. Card for his real opinion—here it is. We see no evidence in it to justify any criticism of Mr. Barron. If



TESTING AIR UNDER THE HEN. FIG. 291.

there are breeders who have the birds which can beat these champions, what are they doing up on the fence crowing about it? Let them get down into the contest pen.

We have also obtained special permission from President Thompson of the American Poultry Association to reproduce from the Standard of Perfection the ideal picture of a White Wyandotte. It is found on page 725. Compare this with the Barron Wyandottes and read what is said on page 724.

Poor Exhibition Birds, But Mighty Layers!

As regards the Barron Wyandottes, from the show room standpoint they are poor exhibition Wyandottes; we can't say that they are not Wyandottes at all, but surely have the shape of the Rhode Island Whites or Reds, which is the antithesis of true Wyandotte shape. They have a little white in ear lobes, which might indicate Leghorn or Mediterranean blood; their legs are not a bright yellow, in fact nearly a White Orpington color, yet this may also indicates excessive laying, which often causes the leg color to fade.

In so far as they have a rose comb, and are white, with what might be called yellow legs and beak, and are also a good-sized fowl, they could be called White Wyandottes of a pronounced utility type, similar to the fowls found on many White Wyandotte utility plants; which generally have a long body and back almost horizontal. Many White Wyandotte show birds have white in lobes, and it is not counted a disqualification in the Standard.

This bunch of birds (Barron's Wyandottes at Storrs) are certainly the liveliest, snappiest lot of hens I have ever seen together. When feeding they pick up their grain, etc., in a very decisive manner, not as though they were starved, but as though they relished it, and wanted the world to know it; for example, just as an energetic person goes about his work with a snap, a know-how and a vim; in short they acted as though they thoroughly enjoyed living.

One point which seems to me not exactly according to Hoyle is the fact that every Wyandotte breeder hails the Wyandotte as the breed with the right shape for a layer just because of these big egg records made by these utility hens, which have not in any particular the true Wyandotte shape, when it is a well-known fact that the show Wyandotte type is a very poor layer; it is really booming the breed under false pretenses. The 1915 new Standard will call for a shape more like utility type, although far from the extreme type seen in Barron's birds. Understand me, I have only my observation of these birds to say they are hybrids; but they look the part all right.

Utility White Wyandottes are not show birds, and White Wyandotte show birds are about as good layers as the Game. There are two sides to this question. Much credit should be given any breeder or breeders who can evolve a breed into such laying wonders as are these Barron hens; further than that, all utility Wyandotte breeders have come to know that the longer bodied type are great layers, which is along the same plane as Barron's ideas; therefore I have nothing to criticise except the attitude of show bird breeders claiming all the thunder of the utility people without having the goods that produce said "thunder." For my part I would like to see the Wyandotte come into its own. As roasters and broilers they are unequaled; yet this is show stock that have these qualifications; a bird modified from both types would be the thing, and that is what the standard makers are striving for.

W. H. CARD.

HAY FROM CRIMSON CLOVER.

Is it wise to cut Crimson clover for hay? At what condition of growth is it best to cut it? How late can it be used for hay before it is dangerous for stock? I have a young orchard under my care which was sown to Crimson clover last year for green manuring. It has made such a rapid and thick growth that it will be impossible to turn it under without plowing very deep. The orchard had been neglected and the roots are therefore near the surface. The orchard is now bearing. I would like to cut this Crimson clover for hay and then plow under the stubble. Is it wise to do so? W. S. F.

Gunston, Va.

Here comes this yearly question. We have it from at least a dozen people. Crimson clover makes excellent hay for cattle. We consider it superior to Red clover for hay, when cut early. There has been some trouble from late-cut Crimson clover when fed to horses. After the bloom heads turn brown you will find upon examination, hard little spines or hooks—quite perceptible as you pull these dry heads through your fingers. There have been cases where these little spines formed lumps or balls in the stomachs of horses so that they died of colic. Many horses fed on this kind of hay never suffer, but some have done so, and it is safe advice never to feed this late-cut hay to horses. Cut early in bloom there will be no trouble, and cattle eat the hay safely in any event. We should by all means cut this clover, as it shows the red bloom freely and make hay of it. If you have other hay we should feed it to the horses or mules and feed the Crimson to cattle. Plow the stubble under as green manure. At Fig. 293 are pictures of two of these balls found in the stomach of a horse. This picture is re-engraved from a government bulletin on Crimson clover.

RAW PHOSPHATE ROCK AND MANURE.

On page 598, H. W. C. asks J. A. V. for his authority that stable manure will convert the phosphoric compounds in raw rock (phosphate) into more available forms. I can quote E. E. Miller, in "Fertilizing for Profits," page 25, last paragraph: "When (raw rock or floats) mixed with stable manure or with any considerable quantity of decaying vegetable matter it will, however, gradually be changed into forms that plants can use."

And why not? The phosphate compounds of floats ground finely are readily broken up anyway, and why should not acids formed in decaying vegetation be used to break up into more available forms of phosphate, as well as sulphuric acid? While doing so the acid which some claim sours land when decaying vegetation is plowed under, is used up in its work on the floats, and is then no longer an acid to sour land. Therefore the floats is then a "sweetener" of souring manure, and used in this way lessens the necessity of lime.

Many times I have seen in THE R. N.-Y. advice to use acid phosphate to soak up urine in stables and as a dust on droppings boards of henhouses. "Floats" is cheaper, will work better owing to the action of acids in droppings acting on floats. Then too you run the risk of liberating the ammonia of the droppings by acid phosphate. I should prefer the use of land plaster on hen manure (droppings boards) also in stable, for the ammonia will readily unite with land plaster, forming sulphate of ammonia, a now-volatile compound, and this can be then applied to the soil and plants get ammonia,

rather than the air, where it surely goes when liberated and has half a chance. F. L. ADAMS.

Florida.

R. N.-Y.—All we ask is that you state the case fairly. What J. A. V. said was that the action of the manure pile would be about the same as that of sulphuric acid on the phosphate rock. The powerful acid "cuts" or dissolves the rock, and makes the phosphoric acid available. There is no such action as this in the manure. We stated that the experiment station had been unable to find any such action. As proof of this statement we offer the following, dated May 1:

So far as I am aware there is no experimental evidence published by any of the stations to warrant the statement that manure makes the phosphoric acid of phosphate rock available to any appreciable extent. We tried for a number of years by both laboratory and field experiments to determine the effect of manure on phosphate rock mixed with it. We came to the conclusion that the effect at best was inappreciable.

Tennessee Exp. Station. C. A. MOOERS,
Chemist and Agronomist.

There have been some good reports from our readers regarding the results from the use of ground rock phosphates with manure but most of them do not show positively whether the gains were due to the phosphoric acid or to some action of the rock phosphate in preventing the escape of ammonia as land plaster would do.

ARSENATE OF LEAD AND SEED CORN.

Is there any solution that can be put on seed corn to keep the crows from pulling it, besides coal tar? I have used coal tar for a number of years with good success, but it cannot be used in any kind of plantings. I would like to plant a field of silage corn on a farm about a mile from where I live. I have never raised corn there before, but it is in between two woods, and I think that crows would make short work of it. Is there a law that prevents sowing corn saturated with strychnine on the field, broadcast for the crows to eat? E. S.

For many years farmers, in New England at least, have been treating their seed corn with tar to protect it from crows. To accomplish this the tar must be thinned until it does not form a waterproof coating over the seed, or germination would be impossible. In course of time the crows seem to have learned to attack corn thus treated, making this method less successful, and an opportunity for experiments has offered itself. The Massachusetts Agricultural Experiment Station took up this subject several years ago, first applying tar to the seed as usual, and following this, while the tar was fresh, with a mixture of Paris green and road dust. The seed thus treated was planted with an ordinary planter, and was entirely unmolested both by crows and wireworms. The results were so satisfactory that they were published, and apparently tested by many, for many reports, both favorable and unfavorable, were received. Most of the unfavorable reports were to the effect that the seed failed to germinate, which was evidently due to applying the tar improperly.

One real defect in this method, however, is that two treatments of the seed are necessary: one with the tar, the other with the Paris green and dust. Accordingly, arsenate of lead paste was diluted to a thick paint and the seeds were thoroughly covered with this, and were then allowed to dry before planting. None of the corn thus planted was touched by crows, though adjoining untreated fields were attacked. Wireworms were found around the seed in the ground but did not touch it until the plants were two inches or more high. At this time they were found inside the seed, but the plants were no longer dependent upon this, so that no harm was done. It should be noted that in some tests of this material in the West, it was found that the wireworms entered the seed after sprouting, at the point where the sprout left the seed, thus escaping the poison and destroying the plants. This was not the case in the Station tests. H. T. FERNALD.

Massachusetts Exp. Station.

MEDIUM RED CLOVER SEEDING.

Medium Red, the most common and most valuable of Ohio's family of clovers, is a biennial plant that thrives in every county of our State. When the conditions necessary for its growth are complied with, these conditions are a well-drained soil with abundance of organic matter and plant food, including lime. The usual method of seeding is with wheat or oats as a nurse crop. When sown with wheat the seed can be sown any time from the middle of February until the first of May with fair success. In the early seeding, a time when the ground is frozen and more or less honeycombed should be selected, as then many of the seeds will fall into crevices and become covered by the soil later on. This covering of the seed is greatly to be desired. The late seeding should be done when the surface of the ground dries and is full of small cracks, into which the seed may fall and become covered. Thus we find that both early and late seeding has the same end in view—the covering of the seed. Very often the seed that is not covered starts to grow the first warm day, and then perishes either by freezing or by drying out before it has sufficient root to carry it through even a few days of early dry weather. At best the present method of sowing the seed on top of the ground is a wasteful one, resulting in the loss of from one-half to two-thirds of the seed used annually. When

COMMON MUSHROOM. AGARICUS CAMPESTRIS. Fig. 292.

the seed is sown late and the ground is dry a thorough harrowing with spike-tooth harrow is of great value in covering the seed and will not injure the wheat, but is often a benefit to it. Before many years a machine that will sow and cover the seed and not damage the wheat will be used for seeding on wheat ground, and at least half the seed be saved by so doing. Seeding with oats is very much more successful if a very early oat is used and a somewhat lighter seeding of the oats; also if the soil is well firmed and a good seed bed prepared,

HAIR BALLS FROM CRIMSON CLOVER HAY. Fig. 293.

as the young clover will suffer less from dry weather if these directions are followed. After the nurse crop, especially the wheat, has been removed the clover begins to grow rapidly, and if left alone will bloom considerably and ripen some seed the first year, and that is what we want to prevent, as the plant is weakened for the next year by allowing it to do so. To prevent this we clip it about a month after wheat harvest if the growth is fairly good, cultivating it about four inches from the ground. By doing this we get rid of the annual

A SCREEN FOR PROTECTING MELON PLANTS. Fig. 294.

weeds and prevent the clover blooming and cause it to make a stockier growth. However, this clipping must be done early enough to have a good growth for Winter protection. With a full stand treated in this way on fairly good soil at least 2½ tons of hay per acre should be cut, instead of the present average crop of 1 1-3 tons per acre for the State. We believe the present low average is largely due to an imperfect stand, due to bad method of seeding and lack of care the first year. If after cutting the nurse crop the growth is not vigorous the application of five tons of manure per acre, put on with spreader, will do wonders for it. If two crops, one of hay and one of seed, are to be cut the next year it is imperative that the hay crop be taken off as early as possible, for if allowed to become fairly mature the chances for seed crop are greatly reduced. If a large crop of seed is desired, and the hay not needed, pasture the clover through May and then clip about two weeks before the usual time for cutting for hay, thus giving the seed crop an earlier start. By so doing a large crop of seed is almost assured. HORATIO MARKLEY.

COVER CROPS, LIME AND FERTILIZER.

We have been dairy farmers. A few years ago we built a nice sanitary stable with cement floor, sanitary fixtures and three large silos. We had 75 cows and the new stable was for 100 with 50 on either side. Before we could get well started and get in the new stock intended, the cattle were not found just right, and in the end we sold off all the stock and the part of farm where we built the new stable, and went out of the dairy business. The cows were sold in other dairies. All our trouble came from a Borden inspector's call, and the news somehow spread that he condemned our stock, which was not the case, but it put us out all the same and sickened us of the dairy. But without the stock we cannot have the manure. We have quite a start with poultry and some hogs. Last Fall some Crimson clover was sown with buckwheat in an oat field. It was put in with a cutaway harrow. The buckwheat did not do well, as the drought kept it back at the start. But a fine crop of oats came in, and the clover looked well at beginning of Winter. This is our first trial with Crimson clover, and it was put in to turn under this Spring. Can we break up the sod this Spring, put in corn and at the last cultivation put in buckwheat and Crimson clover, plow under in Spring and put in oats or barley for the grain? In Fall sow to rye to plow under in Spring, and then go over again with the corn and others as before in a two-year rotation. Can we do this without manure, and how shall we come out in the end? Will our soil keep up and grow better, or must we use manure in some shape. Land is naturally well drained, I think, and mostly up-land and rolling, but not very high. We could have the manure from the poultry, keeping a large number, and also hogs and some cows. I. B.

New York.

There is no question whatever about the possibility of producing good crops of corn year after year without manure. We are doing this very thing on our own farm, and have continued it for six years or more. We plant a flint corn which gives a short season of growth, so that planting may be delayed in order to obtain the largest growth in the cover crop. At the last cultivation of this corn, which with us comes in early August, we seed about 20 pounds of Hairy vetch, and three pecks of rye to the acre. In a season of sufficient moisture we should add to this one pound of Cow-horn turnip seed, and about eight pounds of Crimson clover. This is scattered on top of the ground through the corn, and then gone over with a shallow cultivator. It pays to rake over the spaces between the hills left uncovered by the cultivator with a rake. With a fair amount of moisture this crop properly starts, and grows in the corn. Cutting the corn crop tramples it down somewhat, but does very little permanent injury. The following Spring the rye and the vetch are usually shoulder high early in May. The Cow-horn turnips do not live over Winter, and the Crimson clover is thrown out of the soil during March about six times out of ten. The rye and vetch are plowed under by dragging a heavy chain at the front of the plow. As soon as possible after plowing under, we broadcast each year 500 to 600 pounds of slaked lime, which is at once harrowed into the soil. In plowing under cover crops of this sort in Spring, when the winds are high, packing with a roller or heavy drag, and a prompt harrowing is necessary.

The corn is planted at the usual time and fertilized in the hill with a mixture of chemicals, or crushed hen manure re-enforced with these chemicals, as we have often advised. Again in August the cover crop is put in as before, and year after year this plan follows. Our crops of corn have been heavy, both stalk and ear. They increase from year to year, and the soil itself is growing more mellow, and is in better condition generally. This plan of cover crops, lime and fertilizer, with corn following corn, could be kept up indefinitely, but for the trouble with corn smut and corn insects. After a number of years in many localities corn smut becomes so bad that in order to kill out the disease a rotation is necessary. The same becomes true of the corn worm, but except for these troubles the system may be kept up year after year in a very satisfactory manner. Your plan of corn two years followed by small grain is practical.

The southern part of New York is too far north to be sure of Crimson clover. We should not depend on it for a Winter legume, but should substitute Hairy vetch, using a small quantity of Crimson clover and Cow-horn turnips as indicated above.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

The Mushroom of the Fields.

The common mushroom, Agaricus campestris, so generally grown for market in cellars and caves may be found, usually in October, growing in old pastures in large numbers. Fig. 292 shows how these mushrooms look at the right stage for eating. They have a creamy white, smooth cap, a white, smooth stem, excepting for a slight ring where the cap breaks loose as the mushroom expands, and pinkish or brown gills. The gills produce the spores, which are brown in this case, and the flesh of both stem and cap is white. There is no cup at base of stem, nor warts on the cap, and the stem is not bulbous nor scaly. This mushroom is thus described so that in gathering them in the field no mistake need be made, and one of the poisonous Amanitas picked instead. The Agaricus campestris usually appears in the Fall, and in the open fields. Nothing need be said about the preparation of mushrooms for the table nor of their culture in cellars, which most people know about. The picture shows the mushrooms at about one-half natural size and at an immature stage; when ripe ready to shed the spores the mushrooms are nearly flat on top, are much darker and have a dry appearance. The spores fall to the ground, are carried about by wind and water, and produce the mycelium or spawn which in turn again produces a mushroom.

Ohio. W. E. DUCKWALL.

Mixing Ashes and Hen Manure.

As you stand for the open mind, permit me to disagree with you in agricultural practice. Because going over the ground twice doubles the toil, I mix ashes and fine hen manure and immediately sow them. The material lies so thin upon the ground, especially if harrowed in, that there is no chance for any active chemical union, with loss of nitrogen. I think I have proved this time and again, and think the job is done better, and the surface covered more evenly when the mixture is well combined beforehand.

Maine. G. S. P.

We have often stated that if the ashes and hen manure are immediately worked underground after mixing no particular harm will result. To mix fresh manure with ashes or to use the ashes on the manure as we do plaster or road dust is about the worst farm practice one can mention. We know dozens of farmers who did both things and gave as their authority just such statements as are made above. When we come to analyze such statements we find that there was no advice to mix ashes and leave the manure to expel its ammonia, but these farmers did not analyze and did not stop to reason out the difference. In such cases we think it wiser to print positive advice one way or the other, and let the farmer reason out the shades of difference.

Fighting the Strawberry Weevil.

What about spraying strawberries to drive away the weevil in blossom time?

Browns Mills, N. J. S. J. S.

As the larvæ feed upon the pollen of the buds of staminate varieties, the staminate varieties are most injured, and injury may be avoided by growing as few rows of staminate varieties as are necessary for fertilizing the rest of the bed. Indeed, the very early staminate varieties might be used as a trap crop for attracting the weevils, which might be destroyed by covering the rows with straw and burning, or possibly by spraying with arsenicals. By planting rows of early varieties which flower freely and produce an abundance of pollen near woods and fence-rows where the beetles have hibernated and appear first, they might be effectively trapped, and then destroyed. Although the larvæ cannot be reached with any insecticide, the beetles feed more or less on the buds and foliage, and further experiments should be made in spraying for them with arsenicals. In view of the recent success in the use of arsenate of lead against the plum curculio, we would suggest the thorough spraying of badly infested beds with arsenate of lead three to five pounds per barrel, applying it with an under-spray nozzle so as thoroughly to cover every bit of foliage. This should be applied as soon as the buds commence to form, and probably a week later, before they blossom, as it is then that the beetles are feeding. Spraying at that season can do no possible harm to the berries, and to spray after the buds are injured is useless. The destruction of all trash and rubbish in and around the fields during the Winter will destroy some of the hibernating weevils, and it will be well to avoid mulching the beds where the beetle is troublesome, if the mulch is not absolutely necessary, as it furnishes them the best hibernating quarters. J. T. H.

Dry Earth Vault.

Can you or any of your readers tell me if it is possible to build a fairly sanitary privy, for use for four or five months in the Summer? I can not put in bath room and septic tank until water system is put in, and in the meantime I would like to build the next best thing.

New York. F. H. H.

The ordinary country privy need not be unsanitary if properly built and cared for. For convenience, particularly for that of the women of the household, it should adjoin some rear room of the house, usually the woodshed, and it should be built with a tight vault which flies cannot enter. Aside from the possibility of polluting nearby wells, usually a rather remote possibility, the danger from a privy vault lies in the entrance of flies which later visit the house and leave some of the filth sticking to their legs and feet upon human food. A tight plank box on skids to which a horse may be hitched facilitates the removal of the contents of the privy at necessary intervals, and a box or barrel of road dust or dry loam kept where a little can be thrown frequently over the contents of the vault will keep them dry and inoffensive. There are few better deodorizers than dry loam and the natural instinct which some animals display in covering their excreta with it may, perhaps, indicate Nature's desire that it should be used for this purpose.

M. B. D.

Orchard on Low Land.

I set out an orchard three years ago this Spring, plowing under an old sod, which in the low places was moss grown. Part of the field is high and part low, soil dark in color but sandy, water settles in the low places. I set the field to Wealthy apples, filling with currants and gooseberries. The latter nearly all died within a year. The trees are all alive but have made practically no growth and currants the same. Last Spring I set black raspberries where the gooseberries died. What does the soil need? I have several barrels of droppings from the henhouse, and that is all, as what fertilizer I have from the barnyard I wish to use in a young cherry orchard where I intend to put corn. G. W. N.

Michigan.

It is very evident that at least the lower part of the ground set to orchard is too low for any of the fruits planted on it. My advice is to put it to meadow, especially Red-top grass and Alsike clover, and plant the fruits desired on higher land. Ground that moss grows on is almost sure to be unsuitable for ordinary fruits, and the fact that water stands on it is very good evidence of its unsuitability. If it is practicable to drain the land it might be made fit for orchard trees and bush fruits. Even in that case it may be sour, and need an application of lime to "sweeten" it.

H. E. VAN DEMAN.

Lime on Corn Ground.

1. We have a piece of land that was planted last year to potatoes and this year we wish to plant it to corn and also break up land adjoining it for corn. Next Spring we shall probably sow grass seed with oats on it. Would it be better to apply lime this year or next? And would you advise sowing Winter rye when the last cultivation is given the corn? Our land is a light sandy soil and quickly runs out. Cows have the run of the field for several weeks in the Fall, so would tread down and eat off whatever was sown in the corn. 2. Do you ever sow Canada field peas with oats when you sow grass seed? 3. Would acid phosphate sprinkled on horse manure be likely to injure pigs in any way where they are on the manure? A. S.

York Co., Maine.

On the land where potatoes were grown last year we should plant corn without lime. On sod ground we would use the lime this year. On open ground we would hold the lime until grass seeding. Corn does not respond to lime as grass does, and we would rather use it when the seed is put in. On sod ground, however, the lime will help break up the sod, and make it more available. We have some cases reported where grass seed put in with oats and peas made a fair stand, when the conditions were right. Generally, however, the oats and peas make such a rank, heavy growth that they are likely to smother out the young grass. In such quantities as we have advised it would be safe enough to use the acid phosphate in the manure. There would be no injury to the pigs.

Fertilizer Bluff from Oregon.

A fertilizer is being sold here at the rate of $2 per ton that has the following guarantee printed on the bag: "Nitrogen 7¼; phosphoric acid available 5%; phosphoric acid, total, 12%; potash 6%. Derived from whale guano, ground whale bone and sulphate of potash." Isn't that about the average of any good fertilizer? The manufacturers claim a 25-pound bag of this is equal to seven tons of the best stable manure.

Roseburg, Ore. S. D. E.

Such a fertilizer would contain 140 pounds of nitrogen, 100 of available phosphoric acid and 120 of potash. On the Atlantic coast 250 pounds sulphate of potash would give the potash, 250 pounds sulphate of ammonia and 600 pounds nitrate of soda would give more than the nitrogen and 200 pounds fine bone and 400 of acid phosphate would give more phosphoric acid. Thus the 1700 pounds of chemicals would give more plant food at less than one quarter the cost. The claim that a 25 pound bag of this fertilizer is equal to seven tons of manure is nonsense; a ton of good manure contains 10 pounds of nitrogen, 12 of potash and six of phosphoric acid, while 25 pounds of this mixture will contain less than two pounds of nitrogen, less than two of phosphoric acid and not much more of potash. This fertilizer agent can show an analysis of 200 per cent. wind.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

"Fine Peas and Beans on Poor, Sandy Soil"
A user of Ferguson's Nitrogen Bacteria (name on request) writes with enthusiasm of his excellent crop under very unfavorable conditions. "The Nodules were large and full," he says, "and I am satisfied the land is very much improved."
Ferguson's NITROGEN BACTERIA
used to inoculate the seeds of legumes—peas, beans, alfalfa, clover, vetch—almost invariably gives wonderful results—bigger, better crops. It does more than that: it
Enriches the Soil for Future Crops
Nitrogen, the food that plants must have, is the thing most likely to be lacking in the soil. Ferguson's Bacteria make use of the great supply of Nitrogen in the air, storing it upon the roots of the plants in such quantities that the crop cannot use it all and a big surplus is left for the future. The same bottle contains all the varieties of Bacteria required for inoculation of any legume.
Quarter-acre quantity, 50c.; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—Free. We want agents—a very liberal offer.
HOMEWOOD NITROGEN CO., 51 Liberty Street, New York City

Killing the Peach Borer.

Hardly a day passes without a question about using some paste or smear upon the trunks of peach trees to kill off the borers. The papers are full of so-called cures for this hateful insect which will avoid the time and labor required in cutting or worming them out. Many of these preparations are sold at a high figure, others claim to have a patent on their peculiar method or some secret process of killing this pest. A large number who apply to us have heard that tar or asphaltum painted around the base of the tree will thoroughly clean out the borer. It is often hard to know what to say to these people, since they know of some one who had tried the tar and obtained what they call excellent results. From our own experience we should discourage the use of such materials. They may kill out a few of the borers, but with us it has always been necessary to go over the trees by hand, and make sure that all the insects have been destroyed. At one time we used quantities of hot lye, apparently with excellent results. It became evident, however, that a good many of the borers escaped. Still the work of cleaning off the gum so that the hot lye could operate properly meant about as much work as digging out the borers.

The most effective thing we know of is a strong coating of lime-sulphur mixture of about the strength that would be used for Winter spraying. This could be painted on the lower part of the tree, or sprayed upon the trunk, driving the spray down to the base. This coating of lime-sulphur should be kept upon the tree all the time, and while this remedy is the best we know of as a wash or smear, we would not recommend it as a total substitute for hand digging. We believe that more or less of the latter will be necessary anyway in sections where the borer is very bad. As for tar and asphalt, our advice is to go very slowly with them. The tar we know varies considerably in composition and some of it would we believe prove injurious. We would not pay any large price for a smear or wash which was guaranteed to take the place of digging, because we do not believe it is possible for any coating of this kind to thoroughly clean out the borer.

Apple Aphis.

The apple aphis or louse has received very little attention from the average farmer. The aphids are so small that it is hard to realize the damage they cause is so great. They make up for their lack of size by their persistence and numbers. There is much technical information that could be given, but such can be best obtained from the bulletins of the Bureau of Entomology at Washington. The object now is to call attention to the presence of this insect in time to check his work of destruction. As soon as the apple buds begin to swell in the Spring these little pests begin to hatch from the eggs that were laid on the twigs in the previous Fall. As soon as hatched they commence sucking the sap from the tender fruit buds as the buds begin to grow. This produces the clusters of small misshapen fruit which many growers have been unable to account for, as they had sprayed with both Winter and Summer sprays for ordinary insects. The aphis once established and allowed to go unmolested will increase with great rapidity. They not only cause misshapen fruit, but poorly developed and distorted wood growth results. Many young trees can be formed where the unchecked aphis has so weakened the tree that it will not recover for several years.

As the season advances the aphis will leave the fruit buds and attack the growing shoots, often in such numbers as completely to cover the bark. The young leaves are also affected, causing them to curl, and preventing them from fully developing. There is only one practical method of combating the aphis in an apple orchard, and that is to spray with tobacco extracts, several brands of which are on the market. This extract may be added to any of the usual Summer or Winter sprays, and so save the cost of the extra application. Treatment should not be delayed if good results are desired. It should be given not later than the first Codling moth spraying. If the treatment is delayed longer there will be difficulty in checking the insect as the curled leaves protect the aphis from the spray. Examine the young buds for signs of these pests, and if any are found, spray as directed. Do not let the small numbers in the Spring fool you, as they will increase to many thousands in one season if they are not checked.

R. B. G.

Action of Lime on Soils.

Will burned lime applied at the rate of one ton to the acre on oat ground unlock potash and nitrogen to the extent that it would be advisable to use 300 pounds of acid rock instead of an equal amount of 2-8-10 commercial fertilizer?

Milford, N. Y. M. H. P.

The 2-8-10 commercial fertilizer that you suggested is better adapted for use on oat ground after treatment with lime than the rock phosphate alone. Although lime, when applied in proper quantities, will act as an indirect fertilizer in unlocking potash, nitrogen, and phosphoric acid, the action is not complete at any one time, and the amounts that it makes available are small in comparison to the needs of the crop. The following explanation will show how burnt lime acts as a liberator of the three plant food elements. When lime is applied, there seems to come about a reciprocity between the bases of the insoluble or difficultly soluble forms of potash in the soil, and the base of the lime. These bases then change places, and after several more transitions the potash goes into a soluble form available for plant usage. It seems strange, but it is nevertheless true, that the action takes place more readily between the lime and the potash locked up in the soil, than with the richer artificial crop stimulators as farm manure or commercial fertilizers. The proper amount of lime needed varies with every set of conditions, and a superabundance will prove wasteful to the soil, since more potash will be unlocked than can be readily taken up or completely converted. The exact changes of the potash from the insoluble to the soluble form are very complex, but it is a fundamental fact that potash is more readily available to crop growth through the action of lime.

In the case of nitrogen no direct interchange of bases takes place. The nitrogen is only available for plant usage in the nitrate form, and must be so converted before the plant will make use of it. Tiny organisms are essential for this transition, and as the lime makes possible the breaking down of the nitrogenous compounds in the soil, these bacteria seize upon the nitrogen, changing it over to the ammonia form. Other bacteria now convert it to a more complex compound, and finally it reaches the nitrate stage. But to make this bacterial action possible, the soil must be alkaline, and lime is best fitted to produce this working medium. Besides giving suitable conditions for the change, the lime furnishes a base for the nitrate when formed.

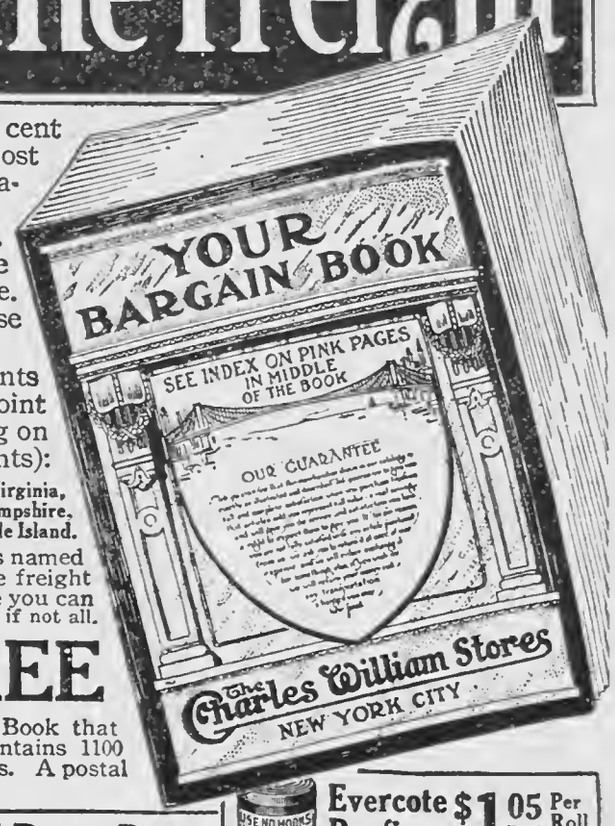
The phosphoric acid exists in the soil in such highly unavailable forms as lime, iron and alumina phosphates, and these are so insoluble that ordinary drainage water carries relatively small proportions. The lime phosphate, however, is considerably more soluble in lime water or pure water than the other two, thus the more lime phosphate and the less iron and alumina phosphates, the more readily is the phosphoric acid available. This being the case, the amount of available phosphoric acid in a well limed soil, other things being equal, is greater than in one deficient in lime. It is supposed that lime also attacks the iron and alumina phosphates, converting the phosphoric acid into the more soluble forms. All of these actions are complex in detail and many chemical deductions must be made, but it has been conclusively proven that lime exerts a very important influence in unlocking the plant food constituents.

B.

On moving into a new neighborhood the small boy of the family was cautioned not to fight with his new acquaintances. One day Tommy came home with a black eye and badly bespattered with mud. "Why, Tommy," said his mother, "didn't I tell you not to fight until you had counted 100?" "Yes'm," sniffed Tommy, "and look what Willie Smith did while I was counting."—Ladies' Home Journal.

Good News To Mail Order Buyers

We Pay the Freight



Now you can tell to a cent just what anything will cost laid down at your R. R. Station. You have nothing to pay when the goods arrive. No other Mail Order House gives you this great advantage. No other big Mail Order House Pays the Freight.

We pay the freight on all shipments of 100 pounds or more to any point in the following States (excepting on safes, vehicles and farm implements):

New York, Pennsylvania, Ohio, Virginia, West Virginia, Maryland, Delaware, New Jersey, Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island.

If you live anywhere outside the States named above we will pay a liberal part of the freight charges. So no matter where you live you can enjoy this Freight Paid Advantage in part if not all.

A. W. GRAY'S SONS, 14 South Street, Middletown Springs, Vermont

Care of Little Turkeys.

I have just read Mrs. Niles Grover's article on "Turkey Raising" and think it one of the best and most concise I ever read. I had 95 nice large turkeys, all larger than pigeons, some would weigh five or six pounds, and I lost 60 of them before I found that it was the buckwheat I was feeding. My bad luck always comes after they are over the size of pigeons. I can get them up that far with hardly a death; then sometimes I lose almost one-half; why, I do not know. Sometimes I am lucky and only lose a few, but always some. Will Mrs. Grover tell us what kind of insect powder she uses? My kind seems only to put the lice to sleep and they revive after a little. Also will she tell us where we can find a market for feathers and what the "fluff feathers" are, and how does she pull the quills so as not to break them? Can dark turkeys' feathers be sold? MRS. L. P. M.

So. Plattsburgh, N. Y.

The three worst enemies of little turkeys are lice, overfeeding and damp. Successfully combat these and a fine flock is almost sure to result. If the brooding turkey and nest can be kept free from lice before hatching time the battle is half won. Dust the nest material well when eggs are put in, and dust the turkey each week, sifting the powder well through the feathers.

The third day after taking the baby poults from the nest dust them in the following manner: Prepare a box large enough to hold a brood of 20 to 25, with a cover not entirely tight. Sit on the ground in front of the coop, spread an old cloth over your lap and catch the poults, one at a time. Grasp him firmly by the legs, lay him on the cloth and straighten out the wings. Dust thoroughly, all over, especially the underside of wings and body and on the head. The dust will not hurt the eyes except to make them blink for a while. Put poult in the box and close the cover. The first thing he does is to shake himself, thus sifting the powder again all through the down. Each one as you put him in will do the same, redusting them all each time. The box will be full of fine dust all the time you are working, and few lice will survive such treatment. When all have been treated turn over the box and let them out. Repeat every week, or better yet, every three days if poults show signs of beng lousy, until too large to catch easily. Always dust the mother, taking the hand to sift the powder through her feathers. The lice will be found on the underside of legs, wings and at the base of quills.

Where the lice are very troublesome whitewash the coops every week, putting kerosene in the whitewash, and being careful to fill all corners and crevices. Many use lard or oil on the poults; perhaps it is all right, but I find the insect powder effective and harmless. I only used lard once, and then I mixed it with sulphur making a salve. I applied it to the heads and underside of wings. In two days my little poults began to droop and die. I investigated and found each little wing blistered and the skin all off. Every last one of them turned his little pink toes to the sun. Vinegar was recommended to me as an excellent louse killer but I never have tried it. Most of the insect powders put up in tight boxes are good, but that purchased in bulk is doubtful. If not taken good care of it becomes too old and loses its strength. There is the Cornell powder, which can be made at home, and sulphur alone is good. I believe more depends on a thorough and persistent application than on the kind of powder.

Many turkey raisers ask the question: "Why do my young turkeys die when about the size of pigeons? They grow and seem fine until then, but I lose sometimes half my flock at that time." In some cases it may be blackhead, and that is a bad disease to combat. Bulletins on the treatment of blackheads can be obtained from experiment stations. But there are other enemies to young turkeys, and many are sacrificed to causes less hard to fight. Overfeeding is one, bringing on indigestion, diarrhœa, liver trouble, etc. Little turkeys must be kept hungry and moving about; exercise is very essential, and they will not exercise if overfed and pampered. They need plenty of sharp grit, and plenty of fresh water in clean dishes. A disinfectant may be added, carbolic acid is good for the bowels and is used in the proportion of one teaspoonful carbolic to one gallon of water.

The first food must be something easily digested, and a hard-boiled egg is *not*. A raw egg is food for an invalid. Wheat bran is light and will not pack in the bowels. Sour milk is excellent for all fowls, the acid acting on the digestive organs. Mix the bran rather dry with sour milk and add a raw egg. Feed only what they will clean up quickly. Continue this food for a month, giving only a little grain such as oat flake or fine chick feed. Change very gradually to a grain diet; first cracked wheat and a little corn, and later whole wheat, oats and buckwheat. Rye and millet seed can also be given, or a mixture of good grains.

When the turkeys are in range they need be fed but once a day. Keep poults out of green grain. If allowed the run of a field of unripe grain they will gorge themselves and die. All grain fed to young turkeys should be a year old. Be sure they are well supplied with sharp grit and fine oyster shells. Keep sour milk before them if possible, but never cook it. Green food must be supplied to young turkeys; they will not, at first, pick it themselves. Cut fine with an old pair of shears kept for the purpose, and mix it with the bran, sour milk and raw egg. Green dandelions, narrow dock, onion tops and mustard are all relished by turkeys. After a little it will become quite a task to cut enough for a flock of 50 or more. They are very fond of it.

Place the coops on new ground every year, away from chickens and feed them separately. Keep the coops dry and clean. If without floors move to clean ground every day and in case of a continued rain sprinkle coal ashes underneath the coop. The little poults must have good care, but never be pampered. Give them all the liberty possible. Study turkey nature and use common sense.

New York. MRS. NILES GROVER.

Hens With Distended Crops.

Now and then one of my hens becomes sick, with a distended crop, so distended that it becomes a deformity. On pressure it seems filled with air and some soft substance. After a few days the hen dies. The feed consists of corn, wheat, buckwheat, occasionally a warm or a dry mash, and scraps from the table. Of the latter they are extremely fond, and while I fear it is that which makes the trouble I can see no good reason for it. The scraps consist of bread, cooked meat, cooked potatoes and raw potato peelings, with remnants of the various side dishes (vegetables) common to good tables. It does not seem to be due to overfeeding of grain. Coffee and tea grounds are dumped into the garbage pail and disappear with the rest. Are the latter injurious to fowls? S. P.

New York.

Hens are subject to a catarrhal inflammation of the crop, due to improper feeding, or to other unhygienic conditions connected with their care, and this manifests itself by distension of the crop with fluids that are often sour—whence the name, sour-crop—and a general appearance of debility upon the part of the fowl. Garbage from hotels and large boarding houses is very liable to contain unwholesome materials and is a somewhat dangerous food unless carefully inspected before feeding. Smaller quantities from private tables are not as likely, of course, to contain bits of spoiled meat and other deleterious food. The distended crop of a hen suffering from this trouble should be emptied by careful manipulation of the crop while holding the hen head downward. She should then be given a little water containing a pinch of bicarbonate of soda, as a sweetener, and placed by herself where she can be fed sparingly upon soft easily digested food until she recovers. M. B. D.

Control of Egg Production.

Some time ago THE R. N.-Y. published an article by G. H. S. taking exception to my position that a hen had control of her egg production; that she could stop it at will, etc. I am in receipt of a letter from an ornithologist in Missouri, Mr. James Newton Baskett—author of "The Story of the Birds"—who endorses my thought completely. The letter is very interesting. Mr. Baskett says: "It is well known to ornithologists that wild birds control the number and time of laying, and while the clutch of a bird may be, say, six, she can be induced by daily robbing her nest of a single egg, to lay two or three times that number. There is a record of a vireo which began building a nest, and when it was completed a cow bird had laid in it all the usual number of eggs except one. The vireo laid that one egg (only) which was necessary to complete the clutch, then went to sitting. If a bird's nest is broken up, she will at once make another nest and lay another clutch of eggs. She most assuredly has control by will of her egg production, as does the common hen. The reason we have the 200-egg hen now is because we have trained her by daily robbing her nest to lay more than the usual clutch of 12 or 15, so that by heredity she has come to lay many eggs."

And he adds: "I doubt if the high layer would continue to lay, if the eggs were left piled up in the nest; and for that reason I have not been able to abandon the idea of a nest egg being suggestive. The hen seeing the clutch not complete is likely to try to fill it out."

I am reminded that the bottom trapnest in my pen of 13 Barron White Leghorns, is on the floor, and it has a nest egg in it, plainly visible when the trapdoor is open. The hens bother me by getting on this nest when they don't want to lay. Two or three hens get "trapped" on this nest every day, that do not lay. Evidently the sight of the egg suggests laying to them, but of course they cannot lay until an egg is grown and ready. These 13 birds are showing their Barron breeding by laying eight to 11 eggs a day, though the truth compels me to add that they have only laid 11 once. Nine, however, is frequently laid for several days in succession, and as one pullet is out of condition and there are really only 12 to lay, this makes a 75% yield, which is not bad considering the weather we have had. GEO. A. COSGROVE.

CROPS AND PRICES.

May 4. Barley, fair quality, $1.05 for 100 pounds; oats 35 to shippers, 40 between farmers; rye 60 per 60 pounds; potatoes 50 to shippers, 55 to 65 to grocers in town. Whole milk to creamery $1.50 per 100. Butter 26 to consumers from creamery, corn from $14 to $16 per ton in car. This is mostly a dairy section; cows selling from $70 to $100. Crops looking fine; a nice rain last night which was much needed. Prospects for fruit fair. W. T. W.

Beloit, Wis.

Beef cattle 7½ to 8½; milch cows $35 to $60; horses $150 to $200; hogs $8.40 to $8.70; butter 25; eggs 15; poultry 12½ to 13. Hay $17.50 to $18 per ton; corn 75 cents per bushel; potatoes $1; apples $5 to $6 per barrel. N. L.

Borden, Ind.

April 27. Maple sugar making finished in most bushes about the 18th of April; most of the sugar made was in April, though bushes were tapped from the 19th to 21st of March. From 1½ to two pounds to a tree was about an average. Owing to cold and late snows only a few oats have been sown, and no other crops got in. Farmers are fixing fences, getting out manure, driving home phosphates and lime from cars, etc. Maple sugar prices at our local stores were 12 cents for best, eight and nine for darker grades. Eggs 18; butter 30; milk in cheese factory $1.23 per cwt.; pork 11 cents by the carcass. A backward cold Spring, but warmer at present and pastures beginning to look green. No stock is turned out to pasture. E. A. B.

Cattaraugus Co., N. Y.

April 30. Corn 65; oats 38; wheat 90; cream 27; butter 25; eggs 16. Hay, Timothy, $15; clover, $12; cows, from $40 to $50; cattle six to seven cents pr pound; hogs, about eight; poultry 14. Potatoes about 60 cents per bushel. Farm land sells from $100 to $150 per acre, according to improvements.

Bloomingdale, Ind. S. B.

April 27. Common stock cattle have advanced here in the past two years fully thirty-three and one-third per cent. Good two-year-old grazing cattle bring 6½ to seven cents per pound; export steers 7½ to eight; dairy cattle, not registered, from $50 to $75. Farm butter 25 to 30; Irish potatoes are worth in the local market $1 per bushel. No fruit for sale. Eggs 16; early Spring lambs 7½; stock hogs, not registered, about 10 cents per pound. These prices are obtained at private sales. R. H. P.

Blacksburg, Va.

April 28. Mixed hay $11.50, loose in mow; buyer pays baling and seller must deliver baled hay to car. Timothy $14; clover $10; corn 90 per cwt.; wheat 90 per bushel; oats 35; potatoes 75; eggs 16; butter 20; steers seven; calves seven; sheep three to four; lambs five to six; hogs 8¼. Much interest in spraying here this year. Farmers pruned and cleaned up their orchards as never before. Poor apples that would grade about No. 3 retail 70 to 80 cents per peck.

New Haven, Ind. H. H.

Cattle are coming through the Winter in good condition. Much grain is being fed. Some farmers are short of hay and are buying loose hay for $12 per ton at the barns. The season is backward; no farmwork done yet and probably none will be done before the 10th of May. Pastures show very little green, and cattle will not get out to get much feed before the middle of May. Potatoes sell for 60 cents at the railroad station. Growers are somewhat discouraged as to the future, and some decrease in acreage is indicated; no powdery scab in this vicinity. The repeated loss from early frost has put a damper on the growing of sweet corn for canning factories, and not so many will plant, but there will be no great difference in the acreage, as some farmers who are fortunately situated so that their farms escape damage from early frost will plant more. There will be more corn planted for the silo. Dairying is on the increase and if the market continues in the future as good as the past few years. Central Maine will see a further increase in the number of cows on the farms. Many, however, are apprehensive of the effects of free trade on the dairy and poultry industries, and are making their plans so that they may change their business into some other line. There is a growing demand for beef and some farmers are planning to introduce beef-producing blood into their herds where dairy blood has hitherto predominated. There is not quite as brisk a demand for cows as a year ago, and prices range from $30 to $60, with some extra cows higher. Butter is 28 cents at local stores; eggs 20; mixed feed $1.55 per cwt.; corn $1.70 for two bushel bag; cottonseed $1.85 per cwt.; gluten $1.70; red dog $1.75. There is a great increase of interest in cooperative societies for the buying and sale of farm commodities and new branches of the so-called Farmers' Union are being formed every week. One has been formed nearly every day recently somewhere in Maine. R. W. H.

400,000 Settlers a Year
Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.
Lord William Percy, an English Nobleman says:
"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."
New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.
For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

Marketing Horseradish.

Can you give information where to market horseradish roots, and the kind of package and probable price. F. O. G.
New Jersey.

There is always more or less demand for horseradish in any of the larger towns and cities, at a price that is remunerative and often quite a profit. It may be sold in the whole root, scraped ready for grating, grated without vinegar and prepared ready for use. The best distributors are the meat dealers, who handle it at a profit of 25% to 30% over the first cost. As a rule there is slow sale for it in the whole root, as most people dislike grating it and will not buy it in that form if it is to be had grated. It usually commands about 10 cents per pound in the root, retail; sometimes and in some sections more may be obtained, but the average retail price is around this. When grated and sold without vinegar, the price obtained for it retail is from 20 to 30 cents per quart. When mixed with good cider vinegar ready for use, it is almost always sold in square, large mouthed bottles, holding about one-half pint, for which 10 cents is charged at retail. Grocers and meat dealers prefer it put up in bottles, and for the regular 10-cent retail size, the retailers usually pay 80 to 90 cents per dozen. In all large market centers there are dealers and distributers to whom horseradish may be sold in bulk. The average price is from $100 to $150 per ton in the root. It may be shipped in crates, open head barrels or potato bags, with equal safety. K.

Alfalfa in Northern New Jersey.

I have given much time and thought to the Alfalfa problem, and have been experimenting for several years in Northern New Jersey, in a small way, with some success, so feel that I can give some assistance to those who are trying to grow this valuable forage. I find that the time to plant Alfalfa is from the 15th to 25th of August, and the most important thing is to have the land in right condition—well cultivated and free from weed seed. This can only be done by plowing the land in the Spring as early as possible, and keeping it cultivated with the Acme harrow (a few days after every rain) so that by planting time there are no weed seeds left in the top soil, and the seed bed in condition to allow the Alfalfa to grow at once, no matter how dry the season may have been. The seed should be sown in the early morning before the dew is off, covered with the Acme harrow, set to run shallow, and then rolled at once. This will insure a stand of nothing but what comes from the seed sown, and that should be the best obtainable.

A. C. WORTH.

R. N.-Y.—From our experience we think Mr. Worth is correct in this. Does it pay to try to start Alfalfa except on the deeper valley soils which are well adapted to it? There are some soils which must be practically made over before Alfalfa will thrive permanently. We think that such soils are more naturally adapted to Soy beans, Alsike and cow peas, and that these will give us protein crops cheaper than Alfalfa will.

Neglected or Abandoned Land.

I am told about Virginia farms that are claimed to be good land with about half valuable timber, oak, hickory and other varieties. It is claimed that the owners held slaves up to the Civil War, and when they were freed the land grew mostly into timbers. Can this be true?
Youngstown, N. Y. R. S.

Yes—why not? Much the same thing may be said of parts of New England. There were many hillside farms occupied by large families. We know of cases where four and even more young men out of one family went to the Civil War, and not one returned to carry on the farm. Those who survived went West to take up government land. Thus those fine farms left to the old folks slowly went out of commission. Today, on many of them, you will find old stone walls in the woods showing that trees have come up in what were once meadows and cultivated fields. In the South, when the Civil War ended, the labor system was upset. Most of the former slaves went wandering away. It was impossible to care for the great farms which, under slavery, were well kept, and they were abandoned. Nature is always looking over the fence trying to get her fingers into an abandoned farm, and these fingers mean trees and brush. Much of this land, both in New England and Virginia, is naturally strong—capable of producing good crops. The changes which produced the forest, however, may have destroyed markets or means of transportation, or changed conditions so that the place would not be suitable for a home. Do not take the word of any real estate agent or land owner as the final word. Do not buy any such land without going to see it and looking it all over. Geo. A. Cosgrove tell how he went "back-to-the-land." He hunted up a farm in the mud of Spring and did not like it. After hunting all Summer he went back to the first farm in the glory of the Autumn foliage—and bought it.

SHORT STORIES.

Lime and Manure.

Is it true that a small quantity of air-slaked lime destroys the efficiency of rotted manure? Would it be advisable to use the two together in a trench for sweet peas? J. D. T.
Auburn, N. Y.

The action of the air-slaked lime would be to set free some of the ammonia in the manure. If this mixture were made above ground or in the open air, the manure would be lost. If, however, the two were mixed together in the ground, there would not be any particular loss, because while the ammonia might still be set free, it would be absorbed and held in the soil to be used by the plants, and it would thus be safe to mix the two together in the soil in case you wish to make the manure more available.

English Sparrows and Cabbage Worms.

From time to time I read inquiries in your columns in regard to the much despised English sparrow. We, also, used to consider them a genuine nuisance, but the last two years we have discovered one redeeming feature. W notice they have taken to the cabbage worm. On several occasions I have seen sparrows crawling among the loose leaves of a growing cabbage to hunt out and devour every worm. Now the question is, have they lately acquired this taste, and only in this vicinity? If they all learn to eat cabbage worms, they are not to be despised. I know they are troublesome in devouring lettuce and green peas. Young peavines can be protected by an application of paris green powder sifted on when dew is on. But you will not kill a single sparrow. They will not indulge in the luxury after the application.
Staunton, Ill. R. L. R.

Setting Up a Buzz Saw.

Take two planks eight to 10 feet long, placing them parallel with the belt, one at each end of the saw frame. Bolt or fasten with wood screws frame to plank about in the middle. At the end of the plank next to the belt toward the power drive a ¾-inch bolt about two inches in the ground so that frame cannot slide toward power. Also drive a bolt behind the frame at the side of the same plank so that the frame cannot swing. If you wish to tighten belt slide saw plank and all and put a stick between bolt and end of plank, and it will stay in line as well as it was before. The two bolts driven in the ground will be all that is necessary to hold it solid, doing away with crotches, stakes or other fastenings, besides being a good real quicker set up. H. G. ANDREWS.

THAT NASTY FLY.—I keep a horse and a cow, both in the same barn near the house. There is a basement under the barn, opening to the east, and a henyard with running water in the yard. The manure is thrown down into this basement every day and a little cracked corn is scattered in it; 30 hens soon scratch it around and woe to the bugs, worms and larvæ in it. I spray the cow, horse and hens with soluble oil 50 to one. Also the stables, henhouse, etc. We have no flies to bother us. I have no dead water around and spray with soluble oil all sinks, drains, etc., daily. We have no mosquitoes. Our home is in Southern Vermont. A. L. B.

LABOR SHORT-CUTS.—We have a tank for making lime-sulphur, make 500 gallons at a time, but can make more and use from the tank without barreling it if we wish. We cook by direct steam and coils both, and have a marine engine, and with the propeller blade in the center of the tank can reverse the blade as often as desired; it stirs up contents of the tank running at high speed. I have become tired of sowing high-priced clover, Alfalfa, etc., on top of the ground, and so have bought a disk grass seeder, and all over the country, farmers are doing the same thing. C. A.
Orleans Co., N. Y.

Flying Dutchman Hay Loader

No Ropes
No Chains
No Cogs
No Gears
No Delays

The One-Man Loader

With this Loader, one man can put on a good, even load of hay, in practically the same time that it would take two men with other loaders.
The Flying Dutchman loads hay, clover or alfalfa without "chewing it up" or threshing out the seed.
It operates with the long, easy, natural stroke of the hand rake, elevates carefully and loads it on the wagon in excellent condition.
Works on an entirely new principle that does away with all cams, drums, chains, sprockets, rope webs, gears and trouble.
Light Draft and Long Life—There's nothing to wear out or get out of order, and the extra long stroke does not pound the machine to pieces.
No Clogging—The yielding deck effectually prevents clogging. Heavy or light hay, swath or windrow can be handled without any adjustment.
All-Steel Frame—It cannot warp, sag, rot, nor get out of shape.

Many ADRIANCE Mowers In Use 40 Years

Are giving excellent service today. No other Mower has such a record because none is so well built.
Adriance Mowers have nearly 60 years of the hardest kind of service back of them.
They are the best made—simplest in construction—lightest draft—most powerful—need fewest repairs, thousands of users will testify.
Adjustable carrying springs take weight from center bar and put it on the wheels, greatly reducing draft and increasing traction.
Cutter Bar follows the ground no matter how uneven it may be.
Automatic spring draft prevents damage to machine, driver or team in case obstruction is struck.
Forward acting, natural position foot lever makes ideal foot brace in controlling fractious team.
Many other strong Adriance features explained in our FREE BOOKLET. Write for it today.
Your Flying Dutchman Dealer sells Adriance Mowers, Flying Dutchman Hay Loaders and complete line of Flying Dutchman Farming Implements. See him.

"Can't-Sag" Gates Save You BIG MONEY

Alvin V. Rowe, Pres.

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long

Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature—reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

EVENTS OF THE WEEK.

DOMESTIC.—An electric shock, caused by crossed wires, cost the New England Telephone and Telegraph Company $15,000 in Superior Court at Exeter, N. H., April 30. This sum was awarded to John A. McAdam, who was disabled for more than a year by a shock received while telephoning in 1911.

The loss of life in the coal mine at Eccles, W. Va., April 30, is now put at 172.

A cloudburst in Oklahoma May 3 destroyed the new $125,000 railway bridge over the Canadian River at Geary, and caused great damage in the surrounding country.

Michael P. Mahoney, who wounded Corporation Counsel Polk in an attempt to kill Mayor Mitchel, of New York, April 17, was ordered by Judge Mulqueen, in General Sessions, May 4, to be confined to Matteawan. The finding of the lunacy commission stated that Mahoney was incapable of making his defence of the trial of the indictment and that he "was in a state of idiocy, imbecility, lunacy or insanity at the time of the commission of the crime."

Two persons were killed at Maud, Tex., May 4, and half the houses in the town destroyed by a cyclone which also did severe damage at Redwater and near Pittsburgh, Tex., injuring some 14 people in the three towns.

The freight steamer Columbian of the Leyland Line, bound from Antwerp for New York, caught fire and was wrecked by a series of explosions in her hold when 150 miles south of Sable Island, May 3. A boat containing 14 of her crew was picked up, May 5, by the Cunard Line steamship Franconia, one of the vessels which responded to the wireless call from the North German Lloyd steamship Seydlitz, the first craft to sight the burning Columbian. Captain McDonald and 13 members of the crew in another boat were saved by the steamer Manhattan, bound for New York from Antwerp. There were no passengers.

United States troops are keeping peace in Colorado. Attempts are being made to impeach Governor Ammons for his failure to restore order. The inquest into the deaths of women and children when the tent colony at Ludlow was destroyed is arousing strong feeling against the militia. Major W. A. Holbrook, in charge of the Federal troops in the Trinidad district, has construed Secretary Garrison's proclamation as to the disarming of all persons in the strike zone who are not in the active service of the United States Army to include members of the Colorado militia as well as strikers, mine guards and others. Consequently the order is being carried out on that theory.

MEXICO.—The announcement was made at Washington, May 5, that the three South American mediators in the Mexican difficulty would meet at Niagara Falls, Canada, May 18, to receive representatives of the parties to the controversy. * * * Carranza, following a split with Villa, threatened to resign as first chief of the Constitutionalists. His resignation would mean a rival revolution. General Velasco, Federal commander, is said to have offered to go over to help Villa with 1,200 men. * * * Huerta is reported in a panic as rebels take the capitals of three States and approach to within 167 miles of Mexico City. Strategically, the dictator has to deal with the Americans in front and the rebels in the rear. * * * Huerta, who apparently has no intention of resigning, continues to concentrate troops between Mexico City and Vera Cruz. The railroad has been mined between these points. The Huerta government factory is turning out 6,000 bombs daily. Funston's army, ready to repel attack, chafes under the restraint of orders from Washington. * * * Villa has unequivocally declined the request of General Maas, commander at Saltillo, to join the Federals in avenging the American occupation of Vera Cruz. * * * Two of the sailors shot in the fighting at Vera Cruz died on the hospital ship Solace. The wounded are being brought to New York. * * * Admiral Badger reported that Tampico was attacked by rebels, following the arrival of their artillery. * * * News reached Vera Cruz, May 4, that John R. Sillman, acting American Consul at San Luis Potosi, had been a prisoner in the hands of General Joaquin Maas, the Federal commander, for 11 days and had been threatened every night with execution. * * * As far as is known no American in Mexico City has been killed or even injured so far. Clubs and business houses with few exceptions have reopened their doors. Among them is the American Club, which was assaulted by a mob during the first few days after the American occupation of Vera Cruz, but is now open under the protection of a police guard. The country club also is in operation and is much frequented by American golfers.

FARM AND GARDEN.—It is estimated that the Southern Pacific will need 5,000 cars to move the west coast cantaloupe crop to eastern and southern markets. The Southern Pacific expects this season to carry to the east from southern California alone close to 72,000,000 cantaloupes. The first trainload of cantaloupes will move east about May 20.

The Department of Agriculture of New York State was informed, May 5, that an area of about one-quarter square mile in Westchester county is infested with Gypsy moth. Inspectors were despatched to fight the pest.

The Farm Mortgage Bankers Association of America was formed in New York, May 7, by seventy-five men from all over the country, but principally from the South and West. It is the first organization of men in this business. One of the principal objects of the new association will be to obtain legislation favorable to farm mortgage investments. The farm mortgage men were told that there is reason to believe savings banks in some States, such as Massachusetts, will join with them to get laws passed making farm mortgages legal investments for savings banks and trustees in such States. A visitor told the convention that the best field for spreading the gospel of farm mortgages as sound investments was New England. A legislative committee will be appointed and the association's work will proceed at once along several lines. There will be an immediate effort to counteract a tendency to lawmaking that the members consider adverse to the farm mortgage business, and there will be work to legalize farm mortgages as savings bank investments in those States which, like Massachusetts, do not at present allow them. The members hope also to do something toward exempting farm mortgages in the banks of investors from taxation.

FRUIT REPORTS.

May 3. Apples 80% live buds; peaches none; pears 20 per cent. G. W. D.
East Bethany, N. Y.

April 26. As far as I can yet judge we shall have a poor crop of peaches, a fair crop of apples and a good crop of cherries and plums. This only refers to our own immediate neighborhood.
Hamilton, Canada. H. A.

May 4. Scale is vanishing; as a precaution we sprayed our orchards this Spring, although no live scale appear to remain. The parasite detected by Prof. Grim of the Kutztown, Pa., Normal School, is manifest in this section, and the fruit growers feel gratefnl to Prof. Grim, and are more than pleased with the hope that spraying may be unnecessary in future to hold San José scale in check. Prospects for fruit are very promising, and the lateness of the season leads to the belief that damaging frosts may not occur at the critical period. It is now three weeks later than usual for planting Spring crops, and much of the oats are yet to be seeded. Potatoes will be planted rather more than an average acreage. Grain and grass prospects are encouraging. The clover root-borer is very damaging to clover that is a year old, the roots being pulverized by the insects, of which a number are usually found near the crown of the roots.
Schuylkill Co., Pa. W. H. STOUT.

April 26. The peach buds are all killed by the hard Winter. One grower told me he had failed to find a live bud on his trees. Pears are also very light in blossom. Very few plums, plenty of cherries and apple buds galore. With good weather at blossoming time, and barring frosts, I look for a bumper crop for 1914.
Pavilion, N. Y. M. G.

April 30. Peaches are not going to blossom very much; think the weather was pretty cold for them during January and February, but the apples are going to blossom very full, and it looks as though we might have a large apple crop. We are having lots of rain now, so that we may not have it so wet at blossoming time. I do not think pears will blossom very heavily as there was a good crop last year. M. A. C.
Le Roy, N. Y.

Our Winter was mild, and stock came through in good shape. Most fruits promise well; some varieties of apples are not blooming well, but the prospect is for a fair but hardly an average crop. Wheat is in fine condition. It is too dry for the young clover and for oats. The ground never plowed in nicer shape than this Spring, so we expect to raise corn this year. D. E. R.
Payson, Ill.

The severe Winter weather through February killed only a few peach buds here, and some of the cherry buds, but April 9th and 10th we had some cold weather that killed many more buds, and still there are more than an abundance of peaches left. The cherry crop promises light, probably a third to half crop. Plums and pears are full and apples seem to have the best average bloom I ever saw, and one in looking from the top of a high hill over the country can see by the white profusion bloom where the orchards are located, and they are numerous in this part of the country. They are blooming about 10 days later than common, and all varieties are in bloom at practically the same time, the early bloomers starting out a few days before the late ones, and the warm weather hurried them along so that they got out before early ones dropped. Probably the fertilizer that was used last year had quite a lot to do with the good bloom. During and since the snows of February the mice have wrought havoc in the orchards all over this part of the country. Some people report as many as half the trees ruined. Generally it is likely there have been as many as 5% of the trees girdled, not only in sod but in all kinds of loose soil. Some of them have been dug around and earth banked up to keep them away but still they worked and poisoned wheat has been fed to them and the end is not yet. Plant lice are scarce yet, but we have some Black Leaf 40 ready for them. It will soon be time for fruit packages. U. T. COX.
Lawrence Co., O.

While in Western New York the past Winter, at nearly every institute, the question of the fruit buds and their condition would be raised. We found that in many cases, with the mercury dropping to 15 below, the peach buds were dead, while in other localities a large per cent. would be reported alive. Naturally I was interested, for with the mercury at 34 and 36 below the day I started from Maine I felt certain there was no hope for fruit on my little experimental plot. It is now the first of May, and I am at my Summer home and find that the buds of the Waddell, Early Canada and Belle of Georgia are nearly all alive, while the Elberta, Mayflower and others are dead. My land is light rocky loam, underdrained, and if peach trees will live through the Winter we have just had, and which is so reluctant to surrender its grip, it seems as though we might count on their staying with us right along. Last year the Elberta's came out in good shape after three or four attacks going to 24 and 28 below.
Central Maine. GEO. M. TWITCHELL.

April 30. We have had a bad month for business; it has been extremely cold or hot. For two different days the mercury has gone to 80 deg. in the shade, and then followed by freezes. Today we had a little snow. There has been a heavy fall of rain. April 25 we had a heavy thunder shower. The ground has been too wet to work; very little plowing done. No oats sown yet. Cultivated orchards too wet to do spraying. Stock take as much feed as in Winter; scarcely any turned out to pasturage. Wheat and grass are looking very promising. Alfalfa has come through well, and is starting out finely where it was not winter-killed. People are afraid to put out cabbage on account of the tariff being removed on foreign cabbage. More wild geese about than usual. Horses are not in as much demand as other Springs, and not quite as high priced. Hay $12 to $14 per ton; wheat 95; oats 40; barley 70; corn 85; good seed corn $1.25 per 60 pounds. Veal nine; young pigs $3 to $4 apiece. Early potatoes $1; late 75; butter 24; eggs 18. E. T. B.
Canandaigua, N. Y.

COMING FARMERS' MEETINGS.

Holstein Breeders' Association, Chicago, Ill., June 2.

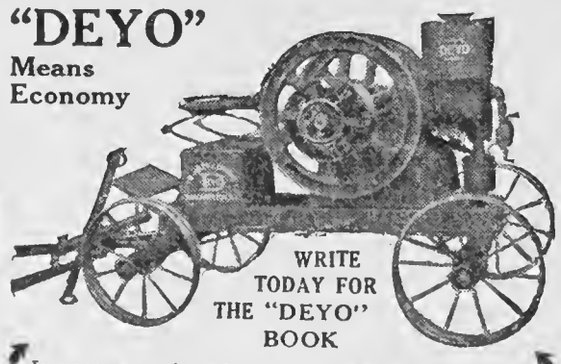
American Association of Nurserymen, Cleveland, O., June 24-26.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5-6.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

SANDY McNAB had the reputation of being a canny man at a trade. He once sold a horse which was described as being "perfectly without faults." Next day the buyer came back. He had found the horse blind in one eye. "You said this horse was faultless!" he roared. "Look at him—look at that eye!" "Weel," said Sandy, quietly, "that's no the puir beastie's fault—it's only its misfortune."—Live Stock World.

"DEYO" Means Economy



WRITE TODAY FOR THE "DEYO" BOOK

In years gone by, when your market was your own family, it didn't make so much difference, but today everything on the farm must be done with the utmost economy of time, labor, money. A

DEYO PORTABLE ENGINE

IS A TREMENDOUS ECONOMIZER

If you haven't an engine—a DEYO engine—you simply can't realize how many things you can do with it, and how much it adds to the profit and pleasure of farming. Tell us your acreage and kind of farming and we'll tell you the engine you need and its cost. Write today.

At all dealers or by mail prepaid - $1.00 JOHN SIMMONS CO. 148 Leonard St. New York City

Guard Against Depreciation!

Build every structure on your farm with an eye to the smallest maintenance cost. Make your building investments pay out in long, satisfactory service. These desirable results are obtained when you use *concrete*.

In the selection of cement for your concrete look for high strength, uniformity of color and fineness and you can't help but use

LEHIGH PORTLAND CEMENT

Our exclusive, scientific process imbues Lehigh with a tensile strength unusually high. This gives to the concrete increasing strength each year. Concrete structures built with Lehigh Cement grow stronger with age.

Our book, "The Modern Farmer," should be in your hands. It tells all about Lehigh Cement and gives full instructions for making concrete barn floors and other farm buildings.
We send it free

Lehigh Portland Cement Co.
701 Young Bldg., Allentown, Pa.
107 Consumers Bldg., Chicago, Ill.

A concrete barn floor is best. It is sanitary, easy to clean, lasts forever and needs no repairs. Build one. Use "Lehigh."

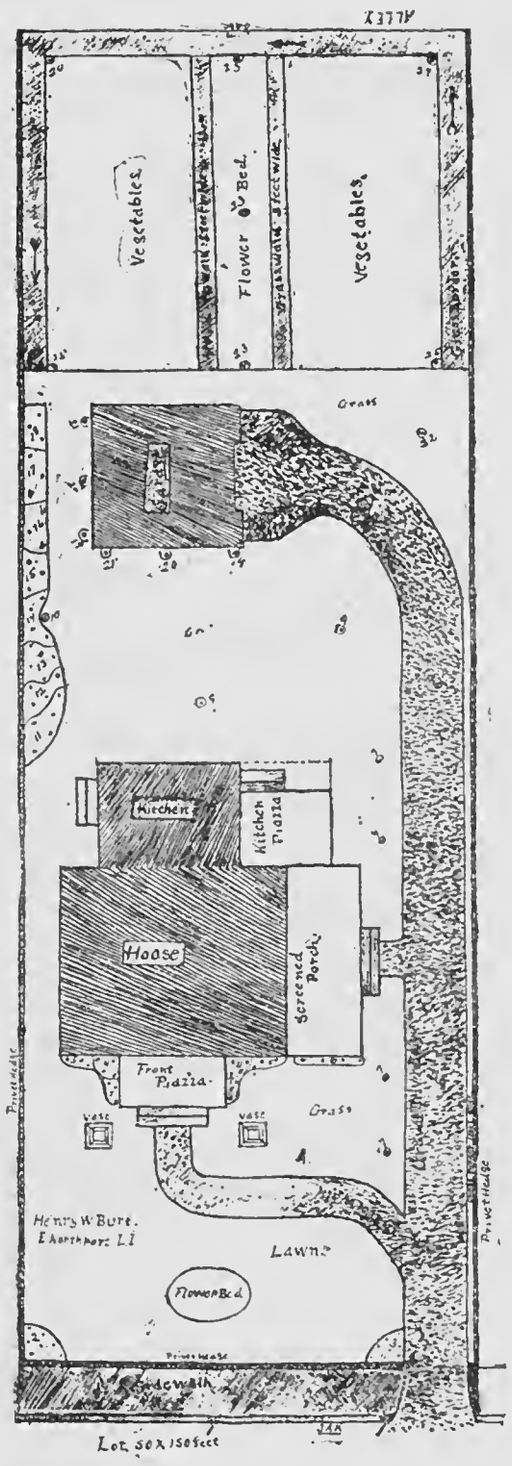
The Home Acre.

Laying Out Small Place.

I have noticed with interest your landscape designs for plots in THE R. N.-Y. I am interested in having a lot, which I have just purchased, laid out with location of paths and such shrubbery as you think would go well with this location. The surrounding country is in lots, with no houses nearer than 400 feet away. I do not want too much put on the lot, but just enough to make the place look neat and up to date.

Long Island. H. W. B.

All necessary grading should be done before trees, shrubs, etc., are planted. For specimen trees and shrubs (that is shrubs located by individual numbers), holes should be dug at least six inches larger than the diameter extension of the roots, 20 inches in depth, and filled with good surface soil mixed with one-fourth its bulk of old well-rotted manure.



The spaces to be occupied by mass plantings should be prepared by trenching. Commencing at one end of the ground to be trenched, a space four or five feet wide is dug out one spade deep, and the surface soil thrown aside. The subsoil is then dug up one spade deep and mixed with a liberal quantity of rotted stable manure; a second section of like width of the surface soil is now to be thrown on top of the first section of subsoil, and the second section of subsoil prepared same as the first, and so on until the entire space of ground to be prepared is gone over. When the digging is finished the last section will be without surface soil, which is to be filled with the surface soil thrown aside when the first section was dug. The surface should then be leveled and a liberal application of rotted manure be given and mixed well with the soil. The sod should be carefully edged up to these plantings as shown on plan by the regular lines enclosing them.

After planting, all tall trees should be staked to prevent them from being moved back and forth by the wind. The tying should be done with some kind of soft material, and in such a manner as to prevent the trees being in any way injured by the stake or tying material.

All deciduous trees and shrubs should be pruned when planted. If this is neglected some of them will be apt to die the first season after planting. This pruning consists in cutting back the top one-fourth to one-third.

Where Rhododendrons and Azaleas are to be planted, an excavation two feet deep should be made, and filled in with good top soil mixed with one-third or one-half its bulk of fibrous sods chopped fine. No manure is to be mixed with this, but after planting the surface of the soil should be covered an inch or so with old cattle manure. Renew this mulching about the middle of July every year. These plants are quite sensitive to drought; and in dry weather should be kept well watered, not merely sprinkled, but the ground soaked at least two feet deep, once a week during the drought. Soak the balls of earth around the roots well at time of planting. This is best done by standing the plants in a tub of water a few minutes with the burlap on. Remove burlap from roots before planting. Late in the Fall give the plants a mulching of forest leaves six or eight inches deep, and further protect them with board wind-breaks from the cold winds of the north, northeast and northwest.

For privet hedge, a trench should be dug 16 inches wide and as much in depth, and filled with good surface soil and well-rotted stable manure in the proportion of three parts soil to one part manure. Immediately after planting the privet should be cut evenly to within four or five inches of the ground and then be allowed to grow the first season without further trimming. The second year the plants should be cut down evenly to within 10 inches of the ground, and be allowed to grow as in the first year without further trimming. The third year cut down to within 15 inches of the ground, when the new growth has reached a height of two to three feet, or the height the hedge is desired, stretch a line along the hedge at the desired height and cut off the tops of the plants evenly to the line.

For evergreens use only good surface soil. The beds should be dug 18 inches or more deep. About 10 pounds of pure raw bone meal mixed with the soil in each bed will prove very beneficial. Use plenty of good stable manure on flower beds and vegetable garden annually.

The driveway and walk should be excavated to a depth of six inches, and if crushed limestone or shale is used as a top-dressing there should be at least three inches of good gravel put in first as a foundation. Cover with two inches of the kind of top-dressing desired.

PLANTING LIST.

Planting No. 1.—3 Norway maple for street, 10-12 feet	$6.00

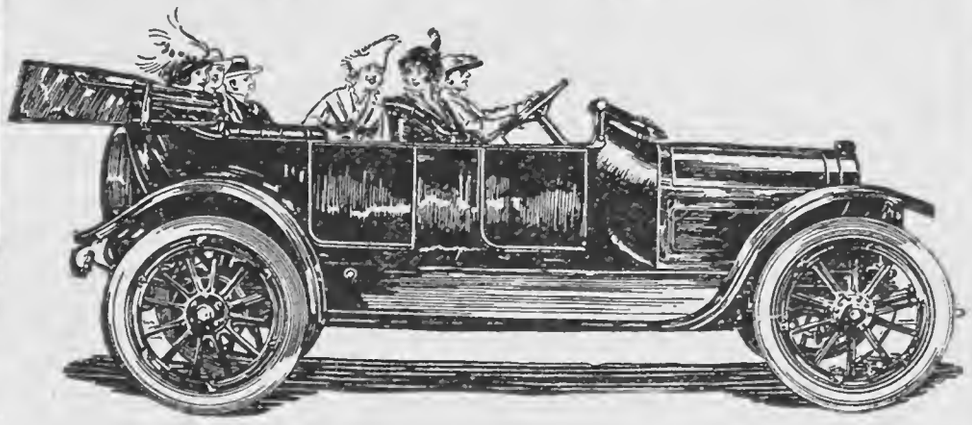
Limited Output—*Limitless* Quality!



This is the manufacturing policy of Elmer and Edgar Apperson. It means much to the buyer in comfort, confidence and cash. More keenly each day Apperson owners appreciate the power, speed, wear-resistance and low up-keep of the

Apperson "Jack Rabbit"

"The Wizard of the Hills"

Our production is limited. Never will it reach that point where *quality* suffers. Never will the "Jack Rabbit" lose its distinctiveness. *Quantity* can be had for the asking. *Quality* only by the stiffest effort intelligently applied.

The work of an entire "know how" organization is centered on the production of a relatively small number of *manufactured* cars. Each one, before it is delivered, passes test after test—by department foremen, final inspectors, superintendents—and last receives the personal inspection and O. K. of either Elmer or Edgar Apperson. No detail escapes them. Such personal attention from two of the best engineers the industry has known would be manifestly impossible were our output "mammoth," "stupendous" or "so many per minute." You know that.

Become acquainted today with the New "Forty-Five"—the twenty-first year tribute to the unerring motor car genius and instinct of Elmer Apperson. Personally, if possible; if not, through the medium of our De Luxe Catalog.

Hope Farm Notes

With great interest, not to say anxiety, I await the Hope Farm man's comments on the invasion of Mexico, which is as germane to agriculture as his report of the baseball game, as exciting and interesting as any I ever read, though I do not devote much time to them. What business have we there? If American honor is to be maintained, why not seize Vera Cruz and hold it for awhile? But to invade Mexico and punish the nation for the wanton act of a usurper, seems hardly a dignified or excusable performance.
Maine. G. S. P.

You can never convince me that any large number of Americans are lying awake nights waiting for the Hope Farm man to fire an opinion at the Mexican situation. I know no more about it than 10,000,000 or more other citizens; not as much, apparently, as some of my friends and neighbors who can tell you just what this nation ought to do. I cannot think what the American people were doing when they did not elect some of these warriors in place of Mr. Wilson. Why he did not select one of those walking exponents of wisdom for Secretary of State is past understanding. Personally I am opposed to war for many reasons. During the former Mexican War Lowell put it like this in the "Biglow Papers":

"As fer war—I call it murder,
There ye have it plain an' flat.
I don't want to go no furder
Than my Testyment fer that!"

* * * * * * * * * * *

"Laborin' man an' laborin' woman,
Have one glory an' one shame,
Everything that's done inhuman
Injures all of 'em the same."

That was written 67 years ago, but it has grown truer with each year. A war with the Mexican people would be straight, brutal, unjustified murder, and it would put back the real progress of farmers and other working people in this country for 25 years. If you will read the "Life of Mark Hanna" with careful thought you will see how the great "patriotic spirit" aroused by the Spanish War enabled the politicians quietly to work through and develop much of the legislation which we are now fighting so hard to overcome.

There were five in my family who were thrown out of a normal childhood by the Civil War. These valiant fire-eaters think they can tell President Wilson how to conduct the case, but I challenge any of them to tell me something new about what war really means. I would rather take care of the orphans and desolated homes that we now have, rather than make new ones. Lets go back to the "Bigłow Papers" again:

"Call me coward—call me traitor,
Just as suits your mean idees,
Here I stand a tyrant-hater
An' the friend o' God an' Peace."

At the present time there is no greater tyrant in this country than the mistaken "patriotism" or prejudice which drives men to yell and wave their hats over a war scare when right within gun shot of their homes are quiet issues and humbler things which demand their patriotism.

As for the "insult to the flag" part of it I think bloodshed would only drive the spirit of it in deeper than ever. Some years ago in a crowd of people a man told another to go to a place which a great general said was the equal of war. He was a little snipe of a man. The other could have taken him over his knee and shingled him, and the crowd all expected it to be done—for that was the accepted method of resenting an "insult." The larger man looked at the little whippersnapper puffed up like a bantam rooster, and there came to him the saving grace of the comical side of it. And so instead of punching him the big man said:

"Thank you, sir, for the invitation to go home with you, but I might interfere with your domestic arrangements!"

The crowd roared, and after he saw the point this "insulter" laughed too. The two men have been friends for years. To talk about plunging this great nation into war because a few Mexicans may make faces or swear in a language we do not understand is nonsense.

The fact is that no man can give a single reason for a war with Mexico that will for a moment stand the test of reason, religion or plain common sense. You might take a man who for long years has worked to obtain justice and a "square deal." No one paid attention to him because he could not interest them. At last after long years he made his case so clear and strong that he attracted attention, and the people who were to decide the matter began to think of giving him justice. All that was needed was a little more clear, honest thinking and the thing was done. Suppose right at that time some one went to these people who were to decide and inflamed their minds with whiskey. Where would our friend be after his long struggle to arouse popular thought? He would take a back seat once more until these people "got over it," and then he must begin again. Now in a larger way that is what a war or a "war scare" would mean to our farmers and workmen. We would lose the hold upon popular thought which we are gaining for the 35-cent dollar, farm credits and co-operation, and when the war was over it would be necessary to begin all over once more. For this reason alone, if for no other, the farmers of this country should oppose a war as powerfully as they have fought a dozen other things which were clearly against their interests. As for handling the situation, I have the greatest confidence in President Wilson and Secretary Bryan. I am going about my business without advising or criticising them.

Farm Notes.—Spring finally came rushing into our valley like one who had tarried by the wayside against the rules and then ran in with a great bluff of finding fault with others. And all the Hope Farmers, from Aunt Jennie down to the little black and white calf in the barn, are glad to see Spring and what she started in the meadows and trees. The crab apple trees came first. They were in leaf by May 1 with the bloom just opening. Most of the crab bloom was killed by a late frost last year, and we had little fruit. Now we are to make it up. The Carman peaches came next. They are budded full, and it looks like a bumper crop. Carman and Belle of Georgia always stand the hard Winters better than Elberta, though that variety carries a fair crop this year. Last year was our heavy apple year and I did not expect a full crop, but the trees have more bloom than I expected. Strawberries never came out finer and the cover crops are jumping. Hope Farm as usual faces the season with good nature. Sorry it is so late, but when your land is all plastered with cover crops it does not make so much difference, because these crops will give some sort of an income anyway—if you let them go.

There are several hundred thousand new Hope Farmers to be introduced. We never started beekeping somehow. The children were stung badly when quite small, and no one here cares for a bee. A neighbor exchanged honey for some of our surplus. But now I have arranged with a bee keeper to pasture some of his bees. He lives some miles away where manufacturing has killed out most of the bloom. So he brought some 15 hives up on our clean, wind-swept hills and set them under a big apple tree. They went to work at once, and proceeded to business on the first flowers. They mind their own business. One of the Italians thought to investigate them, but they did the investigating, and he did the running. We get a share of the honey and the bees are said to help our fruit.

All hands have been working on the lawns at our job of landscape gardening. Mr. Kemp has charge of this job. Mother and I stand back and work in the ranks. The first thing he did was to make a map of the grounds, with each plant and shrub numbered in place. Then he began with the hedge along the road. It is something like putting a machine together in order to get it right. To me there can be no argument worth considering against beautifying the home surroundings. It cannot always be done on an elaborate scale, or with expensive plants and shrubs, but the habit of making the home grounds neat and tidy is one of the best things a child can pick up. If a man and woman can give their children clean and neat habits of mind, head and hand they give them half the battle of life. Many a farmer would far better spend the money he would pay for an auto in beautifying the grounds around the house and water fixtures inside the house. That is our theory—and practice.

Then comes the old familiar garden question. We had our first asparagus on April 27—it was late this year but we hope to make up for lost time. What can be better than a supper of tender asparagus tops cooked in milk and served with cream, bread and butter and baked apple or stewed rhubarb? It takes a large asparagus bed and a well-bred and very sympathetic cow to keep our family going. The peas and a dozen other vegetables are coming on to help later. What *can* a farmer be thinking about when he lets the garden go, or leaves the wife to hoe out a poor little weedy strip? What is your honest opinion anyway of a man who claims to be able to tell President Wilson what to do in Mexico, and yet lets the season go from asparagus to turnips without an attempt at a decent garden? I have my opinion of him as pronounced as that about war.

As usual Spring comes with high drying winds that suck the moisture rapidly out of the soil. This requires special treatment, for on our dry hills this soil moisture is precious. The land should not be left in rough furrows after plowing any longer than necessary. These rough, loose furrows let in the air and the wind blows out the moisture and leaves the soil in dry clods. Such soil should be harrowed down level as soon after plowing as possible. This presents less surface to the wind, and the soil being more compact holds more of its moisture. On such land as ours it will pay to harrow down each day's plowing as the last job of the day. Most men object to doing this, and they do not like to change from plow to harrow but it will pay to do it.

To what extent can a regular yearly subscriber to a rural telephone legally allow it to be used through his exchange by members of his own family or visiting friends, or neighbors without a fee being imposed? Has the operator a right to require name of subscribers before making the exchange or connection?

The extent to which members of a subscriber's family, visiting friends and neighbors may use his telephone is dependent entirely upon the terms of the yearly contract. A contract allowing the us of the 'phone by the family would include visitors of the family, but would probably not include neighbors who come in purposely to use the 'phone. So this subscriber may allow his family and visitors to use his 'phone, but unless the contract so specifies should not allow its use by neighbors where they come in specifically for this purpose. If the contract does not allow anyone but the subscriber's family to use the 'phone, the operator is justified in inquiring if the user is one entitled to its use. H. W. C.

Hog Manure for Apple Orchards.

On page 141, I note your remarks on nitrogenous manures affecting the color of apples. Our orchard is located in the Okanogan Valley, and we have planted a seven-foot strip of Alfalfa between our tree rows. Over this strip are moved portable hogpens. Is the hog manure going to take the color out of our apples? The hogs are only a money-maker and we do not wish to have anything on the ranch that in any manner detracts from the apple. W. N. M.

It is not likely that the penning of a few hogs on the strips of Alfalfa will so affect the apples on the trees as to cause them to grow too large and lack color, but it is easy to try it out in a small way. Hogs running loose in an orchard are often a decided benefit by adding fertility to the soil. In the Okanogan country, which is in northern Washington, I have seen apples on young trees that had been over-irrigated caused to grow too large and lack color, but by reasonable control of the water I do not think there is such danger.

H. E. VAN DEMAN.

The Best Way
To Make Hay
Use a

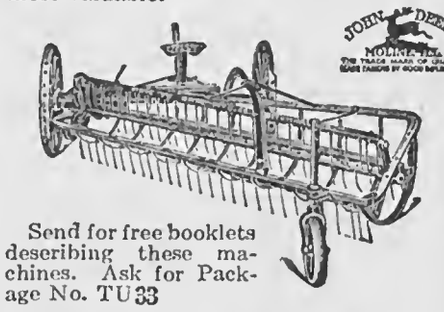
Dain Hay Loader

Load your hay onto the wagon with the Dain, the one-man rake bar hay loader that gathers up all the clean hay but leaves the trash. Rakes operated at exactly right speed to require least power. Strokes of rakes overlap, raking the ground twice. Hay is gathered from swath the full width of machine, regardless of mower used. Change to windrow work easily made. Automatically adjusts itself to handle light or heavy hay and never chokes up. Pushes hay onto center of wagon so that only one man is needed,—the driver. Ask us about other superior features.

Dain Side Delivery Rake

The Dain is the side delivery rake with the steel arch supporting the frame and a reel with three sets of closely succeeding flexible teeth, a construction which means both durability and gentle handling of hay.

The ground is raked clean and the hay left in fluffy windrows through which the air can readily pass so that it is cured without sun-scorching. The best quality of hay and therefore the most valuable.



Send for free booklets describing these machines. Ask for Package No. TU33

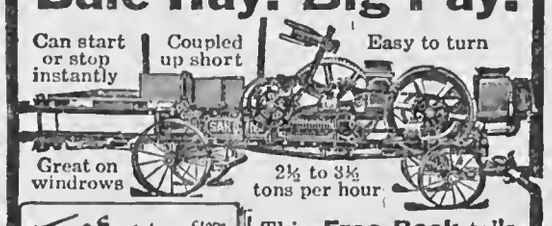
Bale Hay! Big Pay!



Tons Tell The Story of Profits
SANDWICH HAY PRESSES

This **Free Book** tells of profits baling hay. Sandwich owners lead all others: Make $200 to $300 clear profit every month baling hay for growers in their district. "32 tons in 8 hours with a 3-man crew" writes C. W. Brown, Merrill, Michigan. Plenty more bale 20 to 30 tons daily, rain or shine. **Big Tonnage.**

SANDWICH
Hay Presses

This mighty, solid steel **MOTOR BALER** supplies its own power from high grade, hopper cooled, Gas Engine, 4, 6, 8 or 10 H. P. mounted on same truck. Geared Magneto. No break downs. Another exclusive feature—full power delivered to Press by heavy steel roller chain. Turns out solid, salable bales. No dangerous belts to slip or stretch in wet weather. No other baler has this friction clutch on press, can start or stop instantly. Simple self-feeder that stands hard crowding. We make Horse and Belt power presses too.

Grasp This Golden Moment

and mail a postal for our famous "Tons Tell" catalog that shows you in actual figures the money made with the Sandwich Press and how you can pay for your press from your first year's earnings. Sent **free** postpaid. Address today.

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

MARTIN'S METAL STACK COVERS

Galvanized—Corrugated—Extra Quality Coating—
SAVE ALL THE HAY—PAY BIG PROFITS!

More economical than barns or permanent sheds. Easy to put on and take off. Made in sections, thus occupying little space when not in use. Made in all sizes.

Mr. Hammitt of Hardy, Neb., says: "Your cover preserved my hay fine. I got $1.00 per ton more for stack protected with your cover than for other stacks in same field."

The saving on the first stack of hay will more than pay for Martin's Metal Stack Cover. With ordinary care will last 15 to 20 years.

SPECIAL OFFER! Write today for free, illustrated literature and special introductory price to first purchaser in each locality. Write QUICK!

900-912 East Second St., Wichita, Kans. 25 S. Desplaines St., Chicago, Ill.
Stocks carried in Wichita, Kansas, Chicago, Illinois and Canton, Ohio. 10

Ruralisms

Desirable Pecans.

I notice on page 401, H. E. Van Deman says that there are varieties of pecans that are immune to "scab" fungus, phylloxera, shuck worm, etc. I have some land in the Mississippi Delta lands of Louisiana (about 40 miles above Ferriday, where Mr. Van Deman's company has a pecan grove) on which I wish to plant pecans. Would he give a list of what he considers the most profitable of the "papershell" pecans to plant in that location? W. C. V.

Mayaguez, P. R.

There are considerable differences in the immunity of the varieties of the pecan in regard to the scab fungus and their susceptibility to it. The varieties from Texas seem to be the most affected. Those that are the least affected and are of fine quality of nuts and bear well in the Delta region are the Stuart, Van Deman, Moneymaker, Carman, Success and Schley. What they may develop in regard to their ability to be the free from the ravages of the "shuck worm" we do not know as yet, but so far this pest has not been very bad on any of them as I have observed them.

H. E. VAN DEMAN.

The Cabbage Maggot.

On page 518, you have an answer to query on the cabbage maggot. As the treatment recommended does not commence until injury is apparent, I would suggest that the correspondent try the following method, which is a preventive rather than a cure: The cabbage growers in the vicinity of the New York Agricultural Experiment Station were having a great deal of trouble from both the cabbage maggot and the turnip flea-beetle. They called upon the station to help them out, and as a result of a series of experiments conducted by that station, which were published in Bulletin 334, they found that by growing the cabbages in cold frames tightly screened with cheesecloth, having about 20 to 30 threads to the inch, all damage from these two pests could be obviated. The experience of four years has shown that the use of cheesecloth is entirely practicable. In experiments in protecting plants the cost of screening plants ranged from six to 20 cents a thousand.

P. T. B.

Weed Killers.

How can I make a reliable weed-killer? I. M.

It is inferred that this inquiry relates to sprays used to kill weeds in walks or drives. A number of different preparations are used for this purpose. Hot brine (one pound salt to one gallon water) is found very effective on walks and roadways. Most commercial "weed-killers," however, are arsenical compounds, which endure for a long time, as they do not readily leach away. The easiest form to use is made by dissolving arsenite of soda, one pound in three to nine gallons of water. Better try the hot brine if the weed-killer must be used in a place frequented by pet dogs or cats, as the animals might suffer through walking on the freshly treated surface, and then licking their feet. However, where the arsenic seems safe to use, its lasting qualities make it more desirable than the brine. Of course the weed killer must not be allowed to overflow on lawn or flower beds.

Apple Trees Do Not Bear.

I have two apple trees that were planted 16 years ago, and have never borne fruit, but blossomed last year. They are in clay soil. Name unknown. What can I do to promote fruiting?

Patton, Pa. E. M.

It is not uncommon for some varieties like Red Astrachan and Northern Spy, particularly the latter, to fruit late in life. Trees of this sort growing in heavy soil, and which have a severe annual pruning, cannot be expected to produce fruit; they are too busy making wood. In such a case, I would resort to the girdling already described in THE R. N.-Y. by Prof. Van Deman, or I would do some root pruning. On the other hand, I have seen trees which were brought into bearing by pruning. The only reason I can advance as to why the pruning did it was because they had not been sufficiently well fed, and the heavy pruning stimulated the growth of the tree, enabling it to bear. Should your correspondent's tree be in this condition—he can tell whether or not it has fruit spurs—I would prune it so as to allow a good circulation of air among the branches, and to enable the sun to reach all parts of the tree at some time during the day. In addition, fertilize the tree, using about 2½ pounds of nitrate of soda, 3½ pounds dried blood, 10 pounds acid phosphate, and two pounds muriate of potash. Spread this broadcast under the tree from near the trunk out to three or four feet beyond the ends of the branches. If you prefer to use a mixed fertilizer, use one containing about 6% nitrogen, 10% phosphoric acid, and 5% potash, sowing broadcast as described about 20 pounds. As the tree blossomed last year, the latter method may give the desired results. Many trees failed to fruit last year in Pennsylvania because of heavy late frosts when the trees were in bloom. E.

Propagating Grapes; Raising Melons.

1. I have a few acres of grapes. I have bought all the plants so far, and would like to know how to raise my own vines. 2. When is the best time to plant watermelons, cantaloupes and cucumbers in the open ground? D. B.

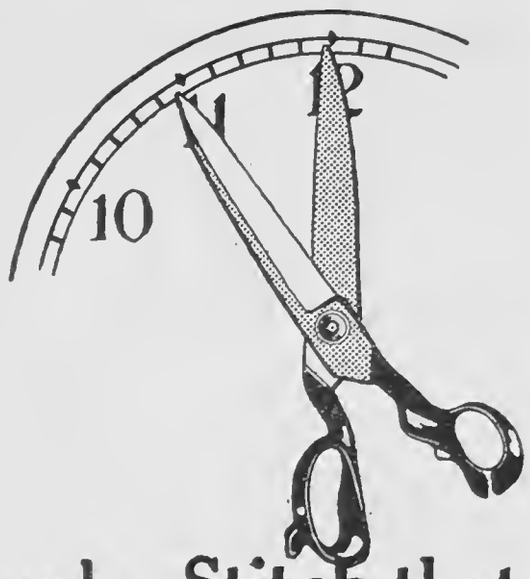
Rosenhayn, N. J.

1. There are several methods by which the grape may be readily propagated, but the most common and most frequently employed is from hard wood cuttings, cut to two or three eye lengths. These cuttings are usually made in late Fall or early Winter from well-matured wood, tied in bundles of 50 and stored in moist sand or decayed sawdust, in a cool cellar or buried in the open ground that is well drained until settled weather comes the following Spring, when they are planted in rows two to three feet apart, with the cuttings four to six inches apart in the row. In this preparation of the soil for their reception, it should be deeply plowed and well pulverized. If this precaution is taken in the preparation of the ground, the planting operation is much simplified; all that will be necessary is the stretching of a planting line where the row comes and push the cuttings into the loose soil at a slant of about 40 deg. to 45 deg., covering the top bud about one inch deep with soil. The end of the cutting above the top bud should be left three or four inches long. This will provide ample room for the hand in handling and much reduce the danger of breaking off the bud when planting. The lower end of the cutting should be cut to within one inch of the bottom bud. This method of propagating the grape will be found quite satisfactory, with nearly all the standard varieties.

2. Plant watermelons, cantaloupes and cucumbers in the open ground, when the soil becomes warmer, and the temperature at night remains at about 55 degrees.

K.

A GUEST was expected for dinner, and Bobby had received five cents as the price of his silence during the meal. He was as quiet as a mouse until, discovering that his favorte dessert was being served, he could not longer curb his enthusiasm. He drew the coin from his pocket and, rolling it across the table, exclaimed: "Here's your nickel, mamma. I'd rather talk."—Pittsburgh Chronicle-Telegraph.



A Cut and a Stitch that Save Time

A LITTLE knife right by the side of the needle, that trims the cloth *while it is being stitched*. Another improvement that makes it possible to cut the cloth for twenty suits at once—and much more accurately.

Another that saves several minutes in marking the positions for buttons.

Add up several hundred of these little savings and you have a big one that *comes back to you in two ways*—better workmanship and better quality of materials.

Go to the Clothcraft Store and try on one of the different models of No. 5130 Blue Serge Special. It represents the very best workmanship, style, comfort, fit and durability that we can put into a fifteen-dollar suit of men's clothes. It's the final result of sixty-eight years of the scientific clothes-making already mentioned.

This label on every Clothcraft Suit. Our signed guaranty in the pocket of every coat.

We'll be glad to send you the new Style Book showing *all* Clothcraft models at $10 to $20, and a cloth sample of 5130 Blue Serge, and to give you a personal note of introduction to the nearest Clothcraft Store.

There is also a fall-weight Clothcraft Blue Serge Special at $18.50 known as No. 4130

SPRAYING for GROUND CROPS

Use the one **best,** Vreeland's

"ELECTRO" ARSENATE of LEAD POWDER

(not powdered)

Mixes easier, sticks better, kills quicker, and has highest quality and efficiency. Always the same. Full directions on every package. Used wet or dry. Will not injure the most delicate foliage. Also spray with Vreeland's

"Electro" Bordo-Lead Mixture

A sure and safe killer for bugs, and early and late blight. Always ready for use. No grit or lumps. Highest amount of active copper. Promotes vine health and stimulates growth. A combination of "Electro" Arsenate of Lead and Bordeaux mixture.

Write today for Manual of Successful Potato Culture.

B. G. PRATT CO., 50 Church St., NEW YORK

Mfrs. of SCALECIDE and sole distributors for the world of Vreeland's "Electro" Spray Chemicals.

The Acre-an-Hour Sifter

beats every hand implement for killing Potato, Melon Bugs, Cabbage Worms, etc. Applies Plaster, Lime, etc., mixed with Paris Green or Arsenate of Lead. Regulates to cover big or little plants, also to apply any quantity of any kind of manufactured dry insecticides. Will operate as fast as desired. Better, easier and faster than any $5, $10 or $15 spray pump. Insist on your dealer showing you this wonderful little implement. Prepaid, **75c.** Agents wanted. Circulars.

ACRE-AN-HOUR SIFTER CO., Dept. B, Poughkeepsie, N. Y.

SPRAY For a Better Potato Crop

Spray 4 rows, fast as team can walk, with **Watson Ospraymo Sprayer.** Adjusts for wide and narrow rows. Both wheels drive wheels. **Bucket, Barrel, Power Sprayers—for all purposes.** Get catalog.

Field Force Pump Co., 2 11th St., Elmira, N. Y.

"MANUAL OF SUCCESSFUL POTATO CULTURE"

is a book which should be in the hands of everyone interested in potato growing—beginner or extensive grower. Latest tested methods of cultivation, planting, spraying, digging, etc., are shown. **This book is free** if you mention this paper. Write for it today.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

The Rural New-Yorker has, at its command, the largest and most efficient corps of correspondents and advisers ever gathered by any farm paper in the world. Thus we can obtain for you the last word on any subject relating to the soil, its cultivation or its products, or the human life of the farm. This service is yours for the asking.

*

A FEW weeks ago we suggested a plan for scoring the milk supplied to town or city. The scheme would be to offer prizes for the cleanest milk. Dairymen who supply milk to the local market should be encouraged to compete and send samples, or samples could be taken at random off their wagons. There ought to be a fair "score" for judging and an expert to decide. This plan would interest consumers in good milk and be a good thing for dairymen. We understand the suggestion will be taken up in several large towns.

*

THE Pennsylvania Railroad recently closed its saloon in the Pittsburgh station. No more intoxicating liquors will be sold at the stations or on the trains of this company. This action is due largely to public sentiment. Prohibition is spreading like a fire in Pennsylvania, and the State will undoubtedly be "dry" in a few years. The Pennsylvania ordered its employees to quit drinking, and the public demanded the "square deal." If liquor is a bad thing for workmen it is just as bad for officers and patrons, and should be kept away from all. Just as soon as the public show that they mean business the temperance question will be settled.

*

FOR some years past the "carbonic acid" theory has been discussed by incubator men. Some thought the gas necessary in the incubator—others considered it responsible for bad hatching. Prof. Lamson's long experiments, recorded on our first page, settle the problem. If now he can obtain as conclusive facts regarding the moisture question he will put brains into the "wooden hen." Some may feel, as they generally do, that anything done at the experiment stations is theoretical and not practical. If running incubators for five years, carefully watching the results many days and parts of many nights, is merely theoretical the man who does it may well sigh for a practical job.

*

IN using lime-sulphur spray this year, one to nine, I have burned my fingers severely, causing a good deal of suffering and leaving my hands partly disabled for a couple of weeks. This occurred in spite of the free use of vaseline on the hands. After the injury had been done I used rubber gloves with leather gloves over them which, of course, gave perfect protection. I have never heard of this injury before and I wish to warn the "tenderfoot" variety of farmer of the possibility.

W. C. D.

We have had the same trouble, though not so serious. The oil sprays do not "bite" in this way. Our folks use heavy canvas gloves and glasses or goggles. It is better to protect the horses with light blankets. By all means warn the "tenderfooted" farmer. The rocky road may make him lame, and if his hands give out he cannot feel his way, or count the money which the real estate men tell him he ought to make. A farmer should dress for his job, and keep his hands as free from injury as he can.

THE latest suggestion is to use ground limestone as a dust upon seed potatoes at the time of planting. This comes from farmers who have quantities of the ground limestone on hand, and think it will take the place of plaster or of sulphur in dusting the seed pieces. Our advice is brief and emphatic—*Don't do it. If you think of doing it, forget it at once.* Powdered sulphur really is effective in preventing the scab disease, and it will help to prevent the seed pieces from rotting in the soil. Land plaster serves to dry out the seed, but has no other particular advantage. Ground limestone will, if anything, increase the scab disease, and will have no beneficial effect whatever. You might far better use the road dust on the seed pieces, for while it would do no particular good, it would not act to increase the germ disease as the ground limestone would be likely to do. The best plan is to soak the seed thoroughly in the formalin solution which we have so often explained, or to dust sulphur on the seed pieces as they are cut. We do both, and find both the solution and the sulphur to be useful.

*

WE have been accused by some enthusiastic parties of favoring the fertilizer trust, because we do not boil over with enthusiasm for the use of raw phosphate rock in the place of bone or acid phosphate. There are two trusts that we stand for. One is the old-fashioned trust in Providence, the other a trust in the tried and tested truths of science. The latter is usually known as common sense. We use phosphoric acid to feed our crops promptly and fully—not to store it up for the future. It is admitted that superphosphate, bone and similar forms give the quick returns, while the raw phosphate does not. But, say the raw phosphate men, the manure pile and the decaying sod make the raw phosphate available! Why use the costly sulphuric acid to "dissolve" the rock when your manure pile or your clover will do it for you? If the manure and the clover possessed any such power there could be only one answer—but are they able to do this? Some years ago a fertilizer concern offering the raw phosphate claimed that Prof. Mooers of Tennessee had found that manure *did* make this phosphate available. He denied the statement, and now after several years more he denies it again:

So far as I am aware there is no experimental evidence published by any of the stations to warrant the statement that manure makes the phosphoric acid of phosphate rock available to any appreciable extent. We tried for a number of years by both laboratory and field experiments to determine the effect of manure on phosphate rock mixed with it. We came to the conclusion that the effect at best was inappreciable.

Tennessee Exp. Station. C. A. MOOERS.

Personally we have felt that the raw phosphate men were injuring their own cause by claiming too much for their methods. Some of them go so far as to say that horse manure will "dissolve" phosphate rock as effectively as sulphuric acid. That is great nonsense, which will disappoint many farmers and lead them to loss. No one would welcome a cheaper form of available phosphoric acid more heartily than we would, but we want to know about it before turning our readers astray.

*

THE picture of a White Wyandotte hen on the next page is shown by special permission of the American Poultry Association in order that our readers may clearly distinguish the difference between those English Wyandottes and the ideal type of the American standard. On May 1 these English birds at the Storrs egg-laying contest were 112 eggs ahead of the next best pen. Thus far they have, without question, laid all around the other birds in the contest, and are still holding their own. This fact has naturally aroused the curiosity, if not the suspicion, of many poultry men. The standard American Wyandotte is a lazy layer. If you doubt it look at the "ideal" bird on page 725. She is a round, plump, dumpling of a sleepy hen, and does not look capable of laying 60 eggs in a year. The Hope Farm man will match his scrubs against 10 such "ideals." It is notorious among practical egg men that the fanciers have been ruining the Wyandotte as an egg-laying machine. Therefore when Barron comes with birds that run and jump for their feed, and do in three months what the standard Wyandotte would do in a year, it is a natural thing to talk "hybrid" or "off type." All that has been proved thus far is that these English Wyandottes would be thrown out of a poultry show on "points." After being thrown out four of them could safely go into a henhouse and challenge 10 of the high-scoring "standards" to an egg contest. Mr. Card tells us on page 714 that the next "standard" will contain a modified or utility form for Wyandottes. It is high time, and here we have the whole case given away. No living hen of the sleepy shape and appearance of this "Standard" could have any chance in an egg contest. As well expect a big draft horse to trot in three minutes or less. We may thank these English Wyandottes and the egg-laying contests for putting the spur of public opinion into the A. P. A., and making them realize that people eat eggs rather than feathers.

The R. N.-Y. is not acting for Tom Barron or any other individual. If anyone has evidence that these champion layers are hybrid or cross-bred birds put up to boom the breed, let him come forward with it at once. It seems to us it is up to the American Poultry Association to prove that these birds are hybrids, or else wake up their sleepy Wyandotte into energy and eggs.

*

THE trustees of Cornell University have elected Dr. Beverly T. Galloway as dean of the N. Y. State College of Agriculture. Dr. Galloway is the present Assistant Secretary of Agriculture at Washington. He is 50 years old and a native of Missouri. A farm-raised boy, he developed into a flower grower and botanist of high reputation. Entering the Department of Agriculture, he rose by painstaking and careful work to the position of Assistant Secretary. Dr. Galloway is an organizer and worker rather than an orator, and he will have ample opportunity for service in New York State at this time, when the idea of organization is uppermost.

*

I have often wondered if the 35-cent dollar which you have so persistently and effectively advertised was a strictly American institution, or whether it was a universal thing. In this connection I have just noted a publication mentioned in the Experiment Station Record which gives some interesting figures bearing on the distribution of the consumer's cost of meat in Paris. It is said to be as follows:

Original producer	76%
Railways	2%
Cattle commissioners	1%
City of Paris	5%
Wholesale dealers	3%
Retail dealers	13%

This distribution, if correct, shows a condition of affairs quite different from what obtains in this country.

K. S.

The 35-cent dollar is an average of net returns received by farmers under many different conditions. The Department of Agriculture has issued figures which show an average of about 40 cents. Our own estimate is made up from thousands of reports which are sent from all over the country. In some cases the producer gets 100 cents of the final price, as the consumer comes to the door and buys. On the other hand we have many cases where a shipper, instead of being paid for his goods, received a bill for the balance due for freight. It was claimed that the goods did not bring enough to pay expenses, though in some of these very cases the goods were actually sold at a high figure. Between these two extremes lies the average—a 35-cent dollar. It has been estimated that the yearly farm crop of food and fibre costs the final consumer about $16,000,000,000. The producer receives of this about $6,000,000,000—the handlers taking the difference. For more than 10 years we have challenged anyone to disprove these statements, but thus far no one has been able to controvert them. The situation is worse in this country for various reasons. This is a tremendous nation with long and costly hauls for food. We were last of all the civilized nations to adopt parcel post. The carriers have far greater monopolies than in European countries. Our roads are generally not so good, and our people have not been trained in coöperative work. These are some of the reasons why the 35-cent dollar is so largely an "American institution." The greatest issue in all American life today, is how to find some way of giving the producer 50 cents or more of the final price of his product. A way will be found when the majority of our people understand how the consumer's dollar is divided. The only way to make them understand is to keep at them.

GUARD the garden.

RUNNING water in the kitchen will save walking for the wife.

A MAN is known by the back yard he keeps—not by the paint on the front of his house.

WITH Spring late and work rushing this is not exactly the open season for writing letters.

IT seems that the man who would train a dog or a horse successfully must first be trained himself.

HERE is a queer freak of nature—rhubarb is sour but the more acid it carries the more it sweetens the family life with its first mess.

RIGHT now when the Winter's manure is to be hauled out, comes the time when we all wish the job had been done day by day through the Winter.

REPORTS which come to us of the city workmen taken to Wayne Co., indicate that these men and women are contented, and have given good satisfaction.

READ what is said about using arsenate of lead on seed corn to repel the crows. There are many reports showing that crows are getting to rather like the taste of tar.

LAND BANK OF THE STATE OF NEW YORK

System of Mortgage Credits Explained.

PART III.

ADVANTAGES SHOWN.—It will be seen that every opportunity is offered in these associations for the accommodation of people who wish to save or invest money in large or small amounts. They afford every advantage of the savings bank with none of the savings bank's faults. They are equally as safe. They pay a better rate of income. The deposits begin to earn income sooner on an average and there is less loss of income from withdrawals. The money is in the control of the men who earn it and save it. They learn how to use it and control it; and it is used for their own business and profit. There is little or no expense in the management of it. The work of the officers is mainly gratuitous. With the savings banks there is a heavy expense of management which comes out of the earnings of the depositors. The money of the savings bank is either invested in speculative building enterprises or in bonds or stocks, but it is not invested in the small mortgages of the frugal people who worked for it and saved it. The savings banks perform a legitimate service in safeguarding the savings of the poor, but they do not compare in efficiency with the savings and loan associations, either in profits on savings or in loans to their own patrons.

LIMIT OF INVESTMENT.—The accumulations of payments on shares, interest and amortization payments on mortgages constitute the capital of the savings and loan associations. They may borrow limited amounts, and when they have a surplus not needed by their own members, they may invest in certain standard securities, but their exclusive business is to loan on first mortgages on real estate to their own members. They can loan to members only or to other associations.

ADVANTAGES SHOWN.—Heretofore the money paid in by the members was all the funds available for loaning to members on mortgages. If the funds were short, the borrowing member simply had to wait until the payments accumulated. In cities and towns where there were many members who wanted to save and comparatively few borrowers, the plan worked all right; but where there was more demand for loans than there was money to supply them the result could not be entirely satisfactory. That was the reason the savings and loan association could not entirely supply farm needs as it was heretofore organized. Some associations in towns had more money than they needed for their urban members. These took neighboring farmers in as members, and made loans to them; but the farmers of a neighborhood could not organize an association of their own and depend on its funds to finance their mortgages. It would take too long to accumulate funds enough to go around. The need was that money should be available at any and all times to take up a mortgage just when the land owner wanted it. This requirement will now be supplied through the Land Bank.

THE LAND BANK.—The law authorizing the organization of the Land Bank of the State of New York was indorsed by Governor Glynn and passed both branches of the Legislature in the session of 1914. It was promptly signed by the Governor, and is now a law, and plans are under way to organize the bank.

ITS POWERS.—This Land Bank of the State of New York will be located in the city of New York. It will be organized by the Savings and Loan Association, and owned exclusively by them. Of course each member of a Savings and Loan Association will actually own his share of the Land Bank through his share of the local association. No local association will be obliged to become a member of the Land Bank. It may become a member or not as its members prefer, but just as a person must be a member of the local association to get a mortgage from it, so the local association must be a member of the Land Bank in order to benefit from it. The local association will become a member of the Land Bank by taking one or more shares in the Land Bank, and the local association will then be entitled to all the benefits of the Land Bank.

THE BANK'S ORGANIZATION.—The Land Bank will be organized in the following manner: When 10 or more local associations signify their intention of becoming members of the Land Bank a meeting will be held of such members, a charter and by-laws will be prepared. These will be submitted to the Superintendent of Banks. He will approve them, and issue a certificate of authority to open up for business. The 10 or more local associations will then receive their certificate of shares in the Land Bank, and pay in $1,000 for each share. Directors and officers will then be elected and the Land Bank will be ready for business. It will have the money received for shares as capital to loan on real estate mortgages. It will also have the authority under regulations of the State to sell Land Bonds. These bonds will be secured by the first mortgages on real estate and an officer of the State will see that each bond sold is secured by such a first mortgage on real estate. This provision will make the Land Bank bonds one of the safest forms of security in the country, and the bonds should sell for as low a rate of interest as most municipal or State bonds.

SUBSCRIPTIONS TO BANK SHARES.—The local association now formed and doing business with resources amounting to $10,000 is in a position to subscribe for one share in the Land Bank, and pay $1,000 for it. New local associations will have two methods open to this. They may organize and go on doing business and accumulating assets until each has resources of $10,000; and then subscribe to one share in the Land Bank. In some sections this method may be a little too slow for the members of the local association. They may want mortgage money at once, and several members may want to place mortgages at once. The new association would not have the money in sufficient volume to make the loans promptly. In that case the mortgages could be prepared and executed to the local association. These mortgages would then be assigned to the Land Bank, and the local association would receive in return one one-thousand-dollar share in the Land Bank and the balance in cash, which would go to the local members who executed the mortgages. When the local association has once secured membership in the Land Bank it need then never be short of funds to finance the mortgages of its members. Of course, it would use its own money first, if it had the funds, but if it were short at any time, the borrowing member would execute his mortgage to his own local association. The mortgage will then be assigned to the Land Bank, and placed in the custody of the Comptroller of the State. The money for the mortgage would be sent from the Land Bank to the local association and handed over to the farmer or homeowner who executed the mortgage. This may go on indefinitely because the Land Bank is authorized to sell bonds as fast as the mortgages are received. The amount of bonds it can sell is limited only by its capital and the mortgages assigned to it. J. J. D.

Farmers' Transportation Association.

A farmers' meeting held May 1, at Burlington, N. J., developed into a permanent organization known as the Farmers' Transportation Association, with W. T. Baggs, Beverly, N. J., president, L. A. Page, Palmyra, N. J., secretary, and with an executive committee of 15 up-to-date men, each representing a shipping section. The primary object of this association is to bring about an improvement in rail transportation facilities for the handling of fruit and produce from the river front section of Burlington County, especially for the markets of Newark and New York. Late deliveries of the Pennsylvania Railroad Company and the Adams Express Company mean losses of thousands of dollars each season to the shippers on account of late arrivals at the destination. The growers have banded together in this move for a protection to their interests, and are hopeful of bringing better conditions about. Lack of railroad competition through this section, which is one of the very best for farm truck in the State, has been the cause of long and continued unsatisfactory service. Pressure will be brought to bear from every known source to give the shippers in that section the service they are entitled to, and which they are compelled to pay for.

New York State News.

CLAIMS AGAINST THE STATE.—The work of disposing of claims against the State is being pursued vigorously by the Attorney General. During the first four months of this year 157 cases have been tried involving claims to the amount of $2,015,490.84 and during the same time 411 actions were dismissed, the damages aggregating $1,677,580.72. It is believed that this record has never before been equalled.

HUDSON VALLEY FRUIT.—The present prospects are that the apple crop in the Hudson River Valley will exceed that of last year. It is said that a large number of new trees are coming into bearing this year and that old orchards have been better cared for than previously. The outlook for pears is good. The Germantown Fruit Growers' association is looking to do a large business this year, and expects to build up a large f. o. b. business in addition to acting as a purchasing agency for the members. Strawberry growers expect a normal crop.

RURAL SCHOOL DAY.—The Department of Education is behind an effort to create a larger interest among people in their local schools. It is proposed to appoint some day next Fall on recommendation, or with the coöperation of the Governor, when the people of the State shall meet in their respective schoolhouses to discuss any matters that pertain to school interests, and collectively to consider the needs, opportunities and conditions of their schools. It is planned to have the annual university convocation on the same day, and thus emphasize the solidarity of the educational interests of the State. It is all a part of a plan of Commissioner Finley to bring the University of the State of New York into closer touch with the educational forces of the State at large.

A GRANGE EXCHANGE.—The Suffolk County Pomona Grange, representing the combined interests of the 13 Subordinate Granges in the county, has established a Bureau of Information and Markets—the object of which bureau is not only to help the farmers find satisfactory markets, but also give them assistance regarding prices and supplies on given markets, and help them arrive at the most approved methods in sorting, grading, packing and shipping. The markets are sought with the ultimate consumer—private families, boarding houses, restaurants, clubs, hotels and cooperative buying and selling societies, organized in many places. Only A1 produce is to be shipped, and by reason of the great number of farmers on Long Island cooperating, all orders received, regardless of size, can readily be filled to the entire satisfaction of the purchaser. This bureau also maintains what is termed a "Farmers' Exchange" for helping farmers in one community to find supplies or sell supplies to those in another district.

THE LEGISLATURE.—The extraordinary session of the Legislature is on. Just whether it will get anywhere on the appropriation bills can be better told later. There is something more than a rumor that each party will set their stakes and stand by them and they will not be set in the same place. The Governor is said to have an appropriation bill for consideration which totals about $600,000 less than either of the bills offered by the Senate and Assembly at the regular session. He has also drawn tentatively a supply bill which is said to represent a still greater saving than $600,000 over any supply bill submitted to the Legislature at the last session. It is likely that if the Senate and Assembly bills appear as economical to the Governor as these he has drawn his will never see the light. The Governor's appropriation bill leaves the offices of the Department of Efficiency and State Fire Marshal intact. And it is said not to interfere with any official.

J. W. D.

Government Crop Report.

According to the Bureau of Statistics the outlook for Winter wheat is unusually favorable. The plant has wintered in good condition and but little trouble from insects and disease is reported. Present estimates, 95.9 per cent, would indicate a yield of 630,000,000 bushels, or 107,000,000 in excess of last year.

The condition of Winter rye is 93.4 per cent. of normal, two per cent. about last year.

Meadows promise 2.4 per cent. better than last year. The stock of hay on farms May 1 was estimated at 7,832,000 tons, compared with 10,828,000 tons last year.

The total area reported in Winter wheat at present is 35,387,000 acres. About 3.1 per cent. of the Fall sowing has been abandoned. Areas in some of the principal Winter wheat States are as follows: Kansas, 7,950,000 acres; Nebraska, 3,123,000; Illinois, 2,576,000; Missouri, 2,549,000; Indiana, 2,485,000; Oklahoma, 2,465,000; Ohio, 2,090,000; Pennsylvania, 1,312,000; Washington, 1,201,000; Texas, 1,082,000. Those above 500,000 acres are: Michigan, Kentucky, Tennessee, Maryland, Virginia, North Carolina and Oregon.

A DRAINAGE FIELD MEETING will be held at Webster, Monroe County, N. Y., May 23, in which the latest models of several types of ditching machines will be in use. The meeting will be held under the joint auspices of the Monroe County Farm Bureau, the State College of Agriculture and the New York State Drainage Association. The area selected is representative of soil conditions in much of Western New York, and the complete system of drainage for the area will be shown on maps, and the reason for its arrangements will be explained by experts in attendance. The machines in operation will be the Buckeye traction ditcher, the Cyclone ditching plow and one or more types of small ditching plow. Hand tools for ditching will also be on exhibition. Methods of taking levels will be shown. Samples of tile will be on exhibition and methods of laying and of protecting joints will be explained. The demonstration is reached by the Rochester and Sodus trolley line and also by the R. W. and O. Branch of the New York Central. E. O. FIPPIN.

CORNELL FORESTRY SCHOOL.—The Department of Forestry at the New York State College of Agriculture at Cornell University has just moved into its new building, and the program for the opening, which is to take place on May 15, includes addresses by many men prominent in State and federal work. At the morning session, former director L. H. Bailey will speak on "The Forest" and W. H. Vary, Master New York State Grange, will discuss the possibilities of our farm woodlots. The afternoon and evening of May 15 will be devoted to a discussion of the lines of principal effort in American Forestry for the next decade. Professor J. W. Toumey, director of the Yale Forest School, will speak on the education side of this question, while practical problems and the duty of making public opinion effective will be discussed by F. L. Moore, President, Empire State Forest Products Association, President H. S. Drinker of Lehigh University, and J. S. Whipple, President, New York State Forestry Association. The problems confronting the National Forest Service, and its work in solving them, will be the theme of H. S. Graves, Forester of the U. S. Department of Agriculture. Gifford Pinchot, President National Conservation Association, will discuss the lines of principal effort of that association during the next 10 years in the national movement for rational use of our great natural resources. The work of forestry in the States of the East, will be the topic of Mr. Alfred Gaskill, State Forester of New Jersey, on Saturday, May 16, at an open meeting of the Society of American Foresters.

Woman and the Home

From Day to Day

THE VOLUNTEERS.

The Volunteers! The Volunteers!
I dream, as in the bygone years,
I hear again their stirring cheers,
And see their banners shine,
What time the yet unconquered north
Pours to the wars her legions forth,
For many a wrong to strike a blow
With mailed hand at Mexico.

The volunteers! Ah, where are they
Who bade the hostile surges stay
When the black forts of Monterey
Frowned on their dauntless line?
When, undismayed amid the shock
Of war, like Cerro Gordo's rock,
They stood, or rushed more madly on
Than tropic tempest o'er San Juan.

On Angostura's crowded field
Their shattered columns scorned to yield,
And wildly yet defiance pealed
Their flashing batteries' throats;
And echoed then the rifle's crack,
As deadly as when on the track
Of flying foe, of yore, its voice
Bade Orleans' dark-eyed girls rejoice.

Blent with the roar of guns and bombs,
How grandly from the dim past comes
The roll of their victorious drums,
Their bugles' joyous notes.
When over Mexico's proud towers,
And the fair valley's storied bowers,
Fit recompense of toil and scars,
In triumph waved their flag of stars.

Ah, comrades of your own tried troop,
Whose honor ne'er to shame might stoop,
Of lion heart and eagle swoop,
But you alone remain;
On all the rest has fallen the hush
Of death; the men whose battle rush
Was wild as sun loosed torrent's flow
On Orizaba's crest of snow.

The Volunteers! The Volunteers!
God send us peace through all our years,
But if the cloud of war appears,
We'll see them once again.
From broad Ohio's peaceful side,
From where the Maumee pours its tide
From storm-lashed Erie's wintry shore,
Shall spring the volunteers once more.
—William Haines Lytle.

THE poem above dates from the Mexican War of 1846. The author, an Ohio man, served in that war, and was killed in the battle of Chickamauga, September 20, 1863.

*

THIS recipe for nut macaroons is highly recommended. Beat the whites of two eggs very light and add gradually, beating constantly, a cupful of pulverized maple sugar, whipping until the mixture will hold its shape. Then fold in one large cupful of chopped pecans which have been lightly sprinkled with salt. Drop quickly from the tip of the spoon one inch apart on an unbuttered tin sheet and bake in a slow oven until delicately browned.

*

THE Florists' Exchange reports that the women of Central City, Ky., are conducting a plant exchange for amateur gardeners on certain specified days. All varieties of pot plants will be exchanged, also shrubs, seeds, slips and bulbs. Anyone having more plants or other articles of one kind than they wish are to bring them in and exchange them for something else. A committee will value each plant sent in and the exchange will be made accordingly. The exchange is to be conducted on the first Saturday in each month hereafter, and everyone is invited to take part.

*

THE lieutenant-governor of a Middle West State has been studying the problem of the unskilled workman, while his wife wished to investigate working girls' troubles. The statesman got a job handling packing cases in a corset factory for $4 a week, but did not make good and was discharged after three days. The statesman's wife got a job in a knitting mill at $5 a week, stuck her week out, was not discharged, and during this time received three offers of marriage. We do not know whether there is any particular moral attached, but the fact that a statesman who got down among the plain people was unable to earn $4 a week makes us wonder whether, on the other hand, the taxpayers get the full worth of their money from those they set in high places. Evidently a position of social dignity, which must have released her from everyday drudgery, did not lessen the industrial efficiency of the statesman's wife, since she was able to hold her position, while $5 a week for a factory beginner must be counted as excellent. Furthermore, we must not forget the three offers of marriage from fellow employees, which were evidence of her social success as a working girl. The equal suffragists ought get a good deal of consolation from the discovery that, given the same environment, a woman is worth a dollar a week more than a statesman, with three chances for a husband thrown in to boot!

*

THE Children's Bureau of the U. S. Department of Labor has just issued Publication No. 6, "New Zealand Society for the Health of Women and Children." New Zealand has been described as a country that is like one big family, and this no doubt aids in the experiments made for social betterment. Two striking features in connection with the society described in this bulletin are the formation of local committees in every township where women could be interested and the establishment of a body of trained nurses, whose duty is to give aid to women and children, especially in isolated rural communities. Owing to the earnest work done in the advancement of this movement by Lady Plunket, wife of a former governor of New Zealand, these trained women are known as Plunket nurses. As a contrast in baby-saving, we find that Dunedin, New Zealand, a city of 41,529, had in 1911 a death rate for babies under one year of four per cent.; Lowell, Mass., 1910, had an infant death rate of 23.1. The infant death rate for the whole of New Zealand (where birth registry is strictly enforced) is 5.1; for Rhode Island 15.8, and for New Hampshire 14.6. We strongly recommend a study of this bulletin, which may be procured from the Chief of the Children's Bureau at Washington; it suggests a valuable line of work for the Grange, and for all clubs and societies in which farm and rural women are interested.

The Conservation of Fuel.

It really seems as though nearly half the fuel used is wasted by injudicious management. There are ways and ways to save. First the furnace; we use a common hot-air furnace, and we have found it saving over the old base-burner-range system. It heats the house better, and really seems to consume little more coal than a good-sized base-burner, and the heat can be turned on or off any room desired, which is something that cannot be done with the stationary stove.

To conserve fuel in this, we keep close at hand the siftings from the coal, and on warm days a shovelful or two of these siftings will "bank" the fire, keep it going and yet hold the heat in abeyance. At night this same scheme is resorted to, and it proves an economical method, because it uses every scrap of coal, even the dust, and it is all turned into heat. We use chiefly soft coal, but can use wood or any kind of fuel. When a little fire is needed in early Fall or late Spring, a few chunks of railroad ties come in handy; they will burn slowly and throw off a good deal of heat. Still another thing, which works better with a steam or hot-water furnace than with the hot air, is this: Papers and old magazines are saved, and in case of needing a little fire these are twisted or wound into tight bundles, and put in on a small fire. They will sometimes heat a house comfortably all day—one bundle will—if the weather is not very cold. If all the old rags which are thrown out were rolled into tight bundles and burned in a hot-air furnace or in any kind of a stove, the country would be the better for it, and the house more comfortable, provided these were used on the right kind of a day.

We have a woodbox, and in this accumulates a great deal of litter. It makes a great "muss" to try to burn it in the kitchen range, and when it becomes necessary to remove this litter, it is shoveled into a bushel basket and carried to the cellar, to use in the furnace when needed. One woman saved the price of Summer fuel almost entirely by using cobs which she gathered from the pigpen. Dry, nothing makes a better or hotter fire than corncobs, and a tubful will do a good deal of cooking if managed right.

Baking can be done with a light fire with a little extra care—that is small baking, like pies, layer cakes or cookies. Make the fire and heat the stove lids hot, have ready your pie or cake to put in the oven, put in as many hot stove lids as you require, and place the pies or layer cakes on these, and have them on the top grate. You will find that the hot lids answer every purpose of the big fire and the hot bottom oven. Such things can be baked with one-half or one-fourth the fuel required to heat the stove to baking heat all over. Another thing is to use the fire while it is in operation. Of course the fire suggested above, will not be kept long enough to cook much, but water may be heated for any amount of dishwashing, etc. Of course where the stove lids are removed something must supply their place, and a kettle or two will do it.

We usually have a soft coal fire in the range in the morning, and only one fire. To use this then, one must be prepared the night before, if baking stewing, etc., needs to be done, by having the utensils ready for instant use on rising. It takes but a little while to make the dessert for dinner, or the cake for supper, and get them baked with this one fire. Then too, considerable ironing may be done by this one fire. If there are two to work so much the better, but if there is but one, the irons may be heated after the breakfast is taken up, the dishes may simply be piled up, and the worker iron until the fire gets too low, and then with red coals inside the stove, she may still go on, by putting the irons right on to the coals. Extra holders will be needed for this, and the irons will need wiping, but a good many plain things may be ironed with irons heated inside the stove.

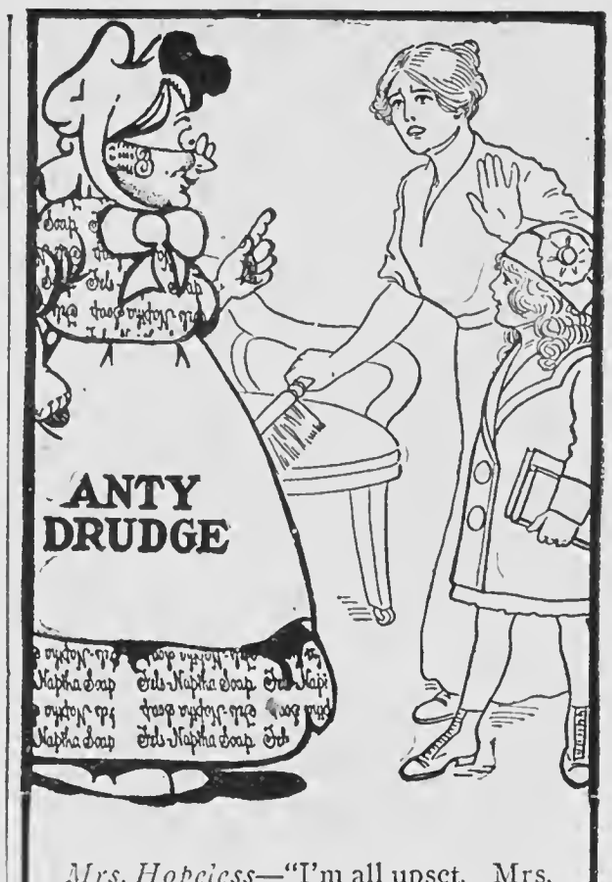
Make the two-hour rice pudding, bake beans, roast meat, etc., in the oven on washday. By cooking meats and things which need long cooking by the one range fire, it will take little fire to cook the vegetables for dinner when that time comes and only a light wood fire will be needed, or gasoline, or other substitute.

The fireless cooker is all right for many things, but for many others, it really is not a saving. If we have to make a fire to heat soapstones, etc., we have made about enough to cook potatoes and such things without the cooker, but for cooking things which require a long time it is useful.

We can conserve by using the fire when we require it, and using both top of the stove and the oven. We may conserve by having things ready to put right over the fire the first thing it is made in the morning, for one good soft coal fire will hold heat to keep things simmering for some hours, but if the things are not put on until the breakfast is over and the work done up, then there will be practically no fire to do it with. Make ready the night before. It isn't any special economy to make a lot of things to get stale. If one pie serves the family then make only one; it takes such a few minutes to make one, and this one can be baked by the single fire in range. Any pie is a hundred per cent. better the day it is baked. Manage your dampers well, and moreover do not neglect the fresh air. Houses are sometimes cold, or rather people are, simply because there is no oxygen left in the air to breathe. A well-aired room will seem much warmer than a higher temperature in a room that is stuffy and unaired. R. S. M.

SOME SAUSAGE DISHES.—"Variety is is the spice of life," in cooking as well as other things, and there are more ways than one of cooking sausage. First, they are good fried or baked in the oven. Second, they are fine cooked with baked beans, in place of salt pork. Soak, boil and season beans as usual. When ready for the oven slice two or three links or sliced sausage meat in small pieces and mix with the beans and bake. They give a nice flavor to the beans and are not greasy. To cook with dried beef, brown or sizzle beef, put a tablespoonful of flour and small piece of butter in frying pan. Then add water and one or more cooked sausage (left over) cut in small bits, and an egg, stirring until it thickens. It is a nice change from beef cooked in milk, especially if you happen to be short of milk. Sausage gives a nice flavor to baked beans for sandwiches.

ALICE E. PINNEY.



Mrs. Hopeless—"I'm all upset. Mrs. Pryor phoned me yesterday that she was going to drive over this afternoon, so I had to put off washing. It takes me all day, and I wouldn't have her catch me working for anything—she'd never get done talking about my poor management."

Anty Drudge—"My dear, I'm afraid you're a poor manager, to put your washing off. You should have used Fels-Naptha Soap. Then you would have been ready to see your visitor, with the wash safely out of the way."

Doing a little each day, with Fels-Naptha Soap to make your work easy, will keep your house clean and fresh, and won't tire you out, either.

Fels-Naptha will do your washing for you in cool or lukewarm water, without hard rubbing or boiling the clothes, and will do it better, quicker and easier than ever.

Fels-Naptha does every kind of work. It makes dirt disappear, dissolves grease, and makes stains vanish, even stubborn blood stains.

Buy it by the box or carton. Follow the directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired. Price of each pattern 10 cents.

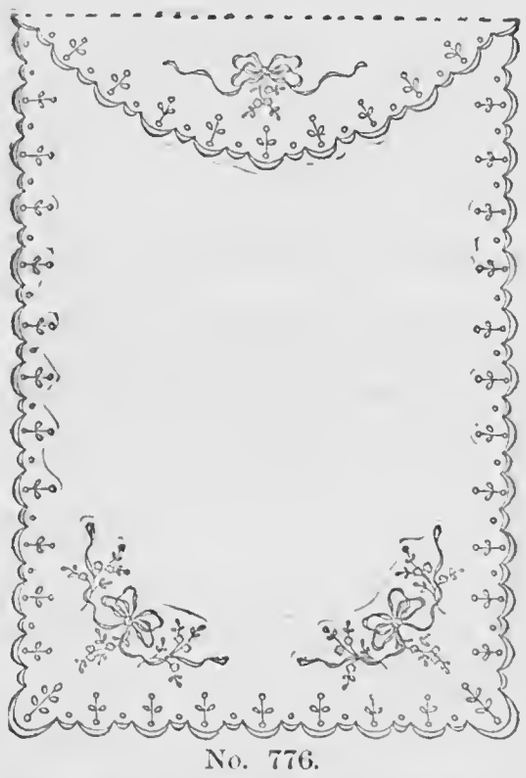
Girl's costume 8257, sizes 10, 12 and 14 years. 8255, semi-princess dress for misses and small women, 16 and 18 years.

No. 8257. No. 8255.

No. 8237. No. 8249.

8237, boy's suit, 4 to 8 years. 8249, child's rompers, 2, 4 and 6 years.

No. 776. A design for embroidering an infant's carriage cover. The scalloped edges are to be padded and button-holed. The dots and ovals within the scallops



No. 776.

can be worked solidly or as eyelets. The flowers, leaves and ribbon are to be worked solidly and the stems are to be outlined. Stamped on 21x36 best round thread Scotch linen with 1 doz. 12 yd. skeins of mercerized floss, 60 cents.

Seen in New York Shops.

Flat hand-embroidered collars and cuffs of linen, which were so much worn a few years ago, are worn again on Spring jacket suits. One handsome set, which consisted of a shawl collar and round cuffs was of rose and white striped handkerchief linen, hand-embroidered in white with forget-me-nots and a scalloped border. It was beautiful fine work, like convent embroidery, and the set was priced at $6.50.

Separate skirts are shown in numerous models, disputing the reign of the one-piece dress. There are beach skirts, sport skirts, walking skirts and "danse" skirts; the separate top coats and cloaks make them a necessity. Dark blue or black serge is a standard material in woolen goods, while linen, crash, ratine and cotton corduroy in white and colors are much used for wash skirts. Many of these skirts have tunics or draperies. Among plain models suitable for wash goods the peg-top and two-piece patterns are in favor.

Tulle ruffs, which many women like when they leave off furs in the Spring, are now made of waterproof tulle or maline; the models are about the same as last year. The "waterproof" material is more durable in wear, and does not melt down at a slight wetting.

Braided rugs are climbing up in the world; one large shop offers them priced from $9.25 to $108.50. They are made in dark colors brightened with dashes of red or blue; of course new material is used in the making. They are made with a wonderful care that home workers in old carpet rags are not likely to imitate. Each strand is rolled smoothly by hand, and twisted, then braided so that no folds show, the braid being smooth and round. The braids are sewn together near the seam, the stitches set very closely, so the rug is reversible. We are told that an oval rug 30 by 52 inches takes one woman from three to six days to complete.

Many people are only acquainted with Canton chairs through magazine illustrations, and do not know, from personal experience, the comfort of this Chinese bamboo furniture. These are the hour-glass chairs with comfortable arm-rests, which magazine artists so often depict in drawing a group of society people on porch or terrace; it is only within recent years that they have become readily procurable in the United States, though long familiar abroad. They are woven of seasoned bamboo by Chinese artisans, and are very durable, extremely light (averaging about eight pounds) and most comfortable. The round base makes them very firm on the lawn, and they are easily carried about. The standard arm chair costs $5, while a style without arm rests is $4.50, and a child's chair 18 inches high is $1.25. Hour-glass tea tables 16½ inches high are $5, and small stands 18 inches high are $1.75. Large deck chairs and settees are offered at higher prices.

Among the new table linen we find dinner napkins have the monogram or initial embroidered in the center, though it is still correct to have it placed in the corner. For luncheon or breakfast set, where a centerpiece and doilies are used, colored cloths with white borders, or white cloths with colored borders, are a fancy of the moment. Fashionable table linen is plainer than it has been, and there are fewer all-over designs. A center of satin and plain stripes, with a floral border, is very popular, or a border of Roman key design, and such cloths are easily matched and always in good taste. There are also borders in figure designs such as a pattern of Cupids.

Inexpensive Substitutes for Polished Floors.

Housecleaning time is here, but with polished floors and rugs, its terrors are far less than in the olden time, when carpets were all nailed down over a thick padding of straw. Few of us, however, are in possession of real polished wood floors, as many of our houses have only a hard-wood floor in the kitchen, being built in the days when less thought was given to sanitary housekeeping. Having a house of this kind, we have experimented with several different floor coverings, and thinking that the knowledge thus gained might be of use to others, decided to pass it on.

In rooms where the wear is very hard, inlaid linoleum, cemented to the floor, is perhaps the most satisfactory floor covering; but it is also expensive. For a border around rugs there is a paper veneer made in perfect imitation of expensive wood. This is pasted to the floor, given first a coat of shellac, and then varnished. We have tried this, and find that while it wears well, it is inclined to crack over the cracks in the flood.

The most satisfactory, inexpensive floor covering we have found is table oil-cloth, pasted to the floor. One floor, thus treated, has been in use eight years and is in perfect condition still. We chanced to discover a piece of oil-cloth in an oak flooring pattern, at one of our local dry goods stores; and decided to try it on our front hall floor. The result was far more satisfactory than was at first expected. We have since used more of it with pleasing results. In some rooms we have treated it to a coat of shellac, properly thinned with denatured alcohol; and over this a coat of floor varnish; and believe that if kept varnished, it will wear indefinitely. The thing of first importance, is to have it well pasted to the floor. Unless well stretched on the floor, it will blister in drying, and of course will neither look nor wear so well. Paste for the purpose should be rather thick. Ample time should be given for drying, before varnishing. If your local dealer cannot furnish it, you can usually get table oilcloth in an oak wood stripe from the large mail order houses.

MARION LAWRENCE.

Hot Drink Substitutes for Tea and Coffee.

A correspondent asks for a hot drink substitute for tea. We seem to have solved the problem to our satisfaction and our experience may be of benefit to others. Hot milk is good (for those who like it) and is very nourishing. Many people can drink new milk or top milk (creamy) if enough tea or coffee be added to it to flavor and heat it palatably, though this is really only a modification, not a substitute. The tea or coffee need not be very strong to give the desired flavor, but should be freshly made and boiling hot. Unless the milk is new or part cream the resulting drink is insipid after the fashion of "milk and water" cambric tea. Our children are very fond of "crust coffee." This is made by browning or toasting a slice of dry bread until it is brown clear through, though not burnt. This hard substance when steeped in hot water yields a cup of brown looking "coffee" which nearly all children like when served hot with a little sugar and cream. This is a good drink for ailing children. Usually a cup of this is relished as soon as appetite returns, and is sufficient in itself for the first meal. Another nourishing drink for invalids or nursing mothers is made by steeping a tablespoonful of grapenuts in a half cup of boiling water, and then adding a half cup of creamy milk with sugar if desired.

F.

ECONOMY CAKE.—Two cups sugar, two cups water, two tablespoonfuls lard (heaping), two teaspoonfuls cinnamon, one teaspoonful clover, ½ teaspoonful salt, one pound seeded raisins. Boil all together 10 or 15 minutes. When cold add three heaping cups flour sifted with one heaping teaspoonful soda. This makes one large or two small cakes.

M. P.

SMALL CHURNINGS.—Mrs. Frederick C. Johnson of Colorado writes, on page 635, of making an improvised churn to be used in churning cream from one cow. For more than 25 years I have used a large milk crock to contain the cream from our cow, when ready to churn, and have used a spoon-shaped wire egg beater to churn the butter. It comes quickly, and this method is much less bother than any other way I know of. MRS. M. E. S.

LITTLE do men perceive what solitude is and how far it extendeth; for a crowd is not company, and faces are but a gallery of pictures, and talk but a tinkling cymbal where there is no love.—Bacon.

Your house is as good as its paint

The real outside of your house is its paint coat. If your paint has been good, your house should be sound. If the paint is poor, your house is in peril.

Dutch Boy White Lead

and Dutch Boy linseed oil make a paint of any color so fine that it sinks into every joint and wood pore, so elastic that it never cracks, so tenacious that it grips the wood like part of the wood itself. It lasts and beautifies for years. In *the end* it's the cheapest good paint made.

You can get red lead in paste form that won't dry out in the can. Ask your dealer.

Live Stock and Dairy

SYSTEMATIC GRADE BREEDING.

A tremendous waste of time and of valuable purebred sires has resulted in the past 40 or 50 years from wrongly conceived and carried out methods of "improving" farm horses. Men have wanted to increase their horse stocks in size, weight and quality, and so have widely employed imported, purebred draft stallions; but in many instances these sires have been injudiciously used with disappointing results. Errors in breeding need no longer occur. Experience has pointed out what is wrong, and young breeders may now direct their operations intelligently and with every prospect of success.

When the grading-up process commenced, our female breeding stock was comparatively small in stature, light in bone and weight, possessed of considerable speed and marked endurance, but lacking in type, character and ability for heavy draft work. To change the character of the stock as quickly as possible to that of a serviceable draft sort, heavy draft stallions from Europe were introduced and employed. The first progeny from the mating of these sires with our native mares were half-bred "Normans" (as French horses were then called), or "Clydesdales" or "English Shires," or "Suffolks," as the case might be. But

CONNECTICUT CATTLE HAULING GRAIN FOR THE EGG CONTEST.

the cross was too violent. There was little "likeness" between mares and stallions, therefore, "like could not produce like," and the colts usually were sorry misfits, mongrels and nondescripts. So disappointing were these first "grades" (really cross-breds), that the owners abandoned at once or soon their first used sires, and experimented with those of other breeds. The American-Norman, American-Clydesdale, American-Shire or American-Suffolk grade fillies were not bred back to sires of the breeds first used, but were out-crossed to other breeds. For example, the American-Norman filly was not bred back to a Norman (Percheron or French Draft) stallion, but was mated with a Clydesdale, or Shire or Suffolk Punch sire, and later on the imported Belgian stallion was used in like manner. Such mating was done in every possible combination and conglomeration, until our horses were "composite photographs" of practically all of the imported breeds, on a native American base or foundation. Not only were imported draft breeds used in this way. Soon imported Coach and light horses came in, or were employed during the same early experiments, and to the wonderful mess of "horse soup" or "horse hash," was added the blood of the English Thoroughbred, Hackney, Cleveland Bay or Yorkshire Coach; the French or German Coach; the Russian Orloff; several pony breeds and some Canadian draft and light stock, together with that of our own American-bred Morgans, Trotters and Pacers.

During this period of breed and blood fusing in America, when mixing and crossing, instead of true grading-up was being done, the French breeders preserved, purified and improved their Percherons, French Drafts and French Coachers; the Belgians marvelously improved their draft horses (Cheval de trait Belgique), and the English and Scotch did likewise with their Suffolks, Shires, Clydesdales and other breeds just mentioned. The American farmer and breeder had no ideal draft type of horse in mind. He did not know just what he wanted, nor how to get it, hence his breeding operations could not and did not result in the production and establishment of a standard, desirable American draft horse. All the while he did know what kind of trotter he wanted, had an ideal type in view, worked intelligently toward it *and got it;* for he evolved, developed and perfected, by intelligent selection and patient, persistent inbreeding and line-breeding the best trotting horse in the world—the American Standard-bred horse that holds all of the world's trotting records for speed, at long or short distances.

Had American trotting horse breeders imitated the draft horse breeders in their mixing, blending, fusing and inter-crossing methods of breed spoiling, there would have been no Standard-bred horse to-day. Had our draft horse breeders copied the trotting horsemen in their breeding methods we might easily have had a Standard-bred American draft horse to-day. We certainly might have had great, well-defined specialist breeding communities in every State, devoted to and noted for the production of a given high-class quality draft horse of one or another of the imported heavy draft breeds, introduced long years ago but not kept pure and not consecutively used for generations to produce practically purebred, graded-up horses of their kind. The fact that we have missed our opportunity and not produced purebred draft horses in numbers explains why we still have to import British and French and Belgian draft stallions annually in great numbers, at a fine profit to the Old World breeder and the New World dealer; but purebred mares are now coming in, and at last we are trying to supply the great and growing demand for home-bred stallions of the various pure breeds. Such home-bred sires are preferable to those from abroad, cheaper, more prepotent and, therefore, likely to prove more profitable in service.

Benefiting from the somewhat sorry experience of our pioneer draft horse breeders, the beginner in such breeding should know that success can only come from unswerving employment of the following sensible rules for the production of high-grade horses:

1. An ideal horse must be decided upon at the start and one pure breed selected and drawn upon for sires.

2. Sound, healthy mares of as nearly the required ideal as possible, must be selected and used from the first to mate with purebred sires of the selected breed.

3. All male progeny must be castrated, all below-standard female progeny discarded, and the approved females bred continuously and consecutively to sires of the selected pure breed.

4. All of the breeding stock and young stock must be so fed at all times as perfectly to develop all of the possibilities of each animal.

5. Only sound, healthy sires and dams must be mated, and everything possible must be done to strengthen constitution and resistant powers against disease.

By following such methods of breeding, any man may in 20 years or less, fill his stables and pastures with practically purebred draft or light horses. Five consecutive top-crosses of the blood of the same pure breed make the progeny to all intents and purposes purebred, and when an additional top-cross is put on, making six in all, only one and one-half per cent. of the blood in the veins of the graded-up progeny will represent that of

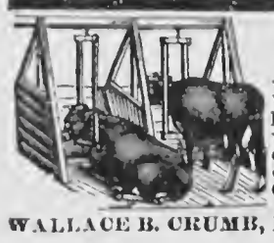
CRUMB'S IMPROVED WARRINER STANCHION



"My barn that was **BURNED** was fitted with Crumb's Warriner Stanchions. If it had not been for the ease with which these fasteners were opened I should have lost my cows," writes Mr. Everett Gains, Bernardstown, Mass. Booklet Free.

WALLACE B. CRUMB, Box M6, Forestville, Conn.

the foundation female stock. That is to say that the six-top-cross horse will be 98.5 per cent. Percheron, or Belgian, or Clydesdale, or Shire or whatever breed has furnished the purebred sires in a direct, unbroken line. This is the only correct and sensible way in which to grade-up horses, or farm animals of any kind. A. S. ALEXANDER, M. D. C.

University of Wisconsin.

That $5,000 Clydesdale Colt.

[On page 676 is a statement of the high-priced colt which Mr. F. L. Ames of Massachusetts has bought. Will Mr. Ames tell us what is to be done with this colt? Will he be used for breeding prize stock, or does Mr. Ames think that the Eastern State can profitably grow draft horses for the city markets?]

My object in buying Mr. Fairbairn's colt was to produce high-class breeding stock. There are a great many draft horses imported into this country from Scotland every year for breeding purposes. Today, we are producing better Guernseys than can be bought on the Island of Guernsey, and I see no reason why it is not possible to breed as good draft horses here as they do on the other side. It is my intention to produce high-class breeding stock that will sell at a good price. On our expensive land here, with our long Winters, it is very doubtful to my mind, whether it would be a profitable thing to breed grade draft horses, but I feel that the breeder here in the East can produce breeding stock at a profit, and supply stallions for the Western trade, where conditions are very favorable for the production of the commercial article. F. L. AMES.

Percherons, Belgians and Jerseys.

I can give you several reasons why I handle the Percheron horse. First, because he is the most popular draft horse in this country, and he is better and more readily sold than the others. Secondly, he is a niee big clean-cut fellow, with good clean limbs, light footed, good life, good style and makes a good general-purpose horse. Third, he makes a good horse to mate with our small chunky mares of all breeds.

I handle the Belgian horse because he is the second-best draft horse in this country, and gaining on the Percheron every day. He is a growthy big fellow, that gives us great size, he is a great feeder, and will eat almost any kind of roughage, and any kind of vegetables and grain with a relish. He is a short-coupled good middle horse with lots of endurance. It takes less feed to keep him in the same condition than any other draft horse in the world.

We keep the Jersey cow for butter and milk. She will produce more butterfat and solider and better butter on less feed than any cow in the field today. In other words she is a piece of machinery that does more work with less power than the others. We are not in the beef business, hence we do not turn our attention to the beef cow. We are in the milk business, hence do not turn our attention to cow that gives the greatest flow and greatest quantity of milk.

Pennsylvania. O. N. WILSON.

Possibilities in Mule Raising.

What are the possibilities in raising mules as compared with horses for Eastern farmers? That is, if a man has mules for breeding and can find a jack reasonably near, will it pay him to raise mule colts rather than horse colts?

There is a brisk demand in South Jersey for mules, and on a number of occasions the Live Stock Commission has received requests for jacks for service. It was suggested that while the State offered a number of stallions for stud purposes that it would be well to meet the demand for mule breeding by providing jacks of good individuality and usefulness. We have always refrained from taking this step, as the law creating the Live Stock Commission was established to promote interest in the breeding of live stock, and the raising of mules is not primarily breeding, that is, if we take as our aim the problem of improving the type and usefulness of a particular class of animals. Your efforts are halted the first generation in mule breeding, and it would seem that the individuals had best take up such problems on their own part. There is no doubt but that the mule is gaining in popularity in South Jersey, especially within the area where the farmers are able to market their products in Philadelphia. They maintain that mules are better adapted for night road work, can put in longer hours if necessary, and are no doubt very well adapted to the class of work that is required on a truck farm. It is further stated that in South Jersey the mule colts sell higher than horse colts. To what extent it would be advisable to produce mules for market is a question, but surely it is more profitable to grow mules than to produce such animals for farm work. Often times men object to working mules, and again it is claimed that they are not so well adapted for work on soft ground. It would seem reasonable to conclude that if the conditions on one's farm were such that mules would be adapted for the farm and delivery work, that there would be as much money in producing them as there would be in breeding horses. It is known that they are somewhat easier to care for with safety as far as feeding is concerned, and furthermore, it is very seldom that a mule is injured by wire fences when he is at pasture. He seems to have the ability of protecting himself, a possession that draft horses do not always have. If I wanted a pair of mules and lived in South Jersey, I am sure that I would prefer to breed them rather than purchase them, and believe that it could be accomplished more economically. The medium size mule out of a 1,100 or 1,200 pound mare seems to be the popular type, notwithstanding the fact that a number of years ago the sugar loaf or larger type of mule seemed to bring the highest prices. F. C. M.

Curds in Buttermilk.

Can you tell me of any way to handle milk to eradicate the effects of casein? I have a grade Jersey cow giving 12 quarts of milk per day, from which we can only gather enough cream to churn about one pound of butter per day; buttermilk is full of flaky curds. I am feeding meadow hay, sugar beets about one-half bushel per day, and four quarts per day of bran, corn chop, brown middlings and ground oats, equal parts.

Pennsylvania. E. R. F.

The flaky curds in the buttermilk are not butter, but particles of curdled milk, and have nothing to do with the amount of butter you obtain. They may be avoided by keeping the milk out of the cream as much as possible, if the cream is separated by gravity methods, and by frequent stirring of the cream while ripening. If you are not getting as much butter as you should it is probably due to poor separation rather than faulty churning. C. L. M.

Shoeboil.

I have a horse which has a shoeboil of long standing. I have put medicine from a veterinarian on it for some time, and also tried iodine and camphor. It does not heal up. At times the leg swells and sometimes the boil breaks open. Can you advise me what to do in this case?

New York. C. H. O.

There is only one proper method of treatment in such a case, and that is to cut off the shoeboil and then treat as a common wound. The operation is simple and performed as follows: A piano wire is knotted around the base of the shoeboil and then pulled very tight to make the "neck" of enclosed tissues as narrow as possible. The "neck" is then cut through and bleeding vessels picked up and ligated, or the actual cautery used to stop bleeding. Some veterinarians use a cautery to remove the mass, instead of using a knife. If the wound then is wetted several times daily with a lotion compound of one ounce of sugar of lead and six drams of sulphate of zinc in a pint of water, it will heal quickly and would leave only a small scar. A. S. A.

"Do you put your faith in the wisdom of the plain people?" "I do," replied Senator Sorghum, "until they get to thinking they know more about running the country than I do."—Washington Star.

HOLSTEIN CATTLE

According to figures compiled by the department of animal husbandry of Illinois University, a cow must produce 4,000 pounds of milk and 160 pounds of fat a year to pay for feed and labor. Every 1,000 pounds above this brings a yearly profit of $10. Thus a 5,000 pound cow earns $10 a year, an 8,000 pound cow earns $40, but when production reaches 10,000 pounds the profit is $63.

Systematic investigation confirms the wisdom of those who have taken up the Holstein-Friesian breed.

FEEDING PROBLEMS.

UNDER this heading we endeavor to give advice and suggestions about feeding mixtures of grains and fodders. No definite rules are given, but the advice is based upon experience and average analysis of foods. By "protein" is meant the elements in the food which go to make muscle or lean meat. "Carbohydrates" comprise the starch, sugar, etc., which make fat and provide fuel for the body, while "fat" is the pure oil found in foods. "Dry matter" means the weight of actual food left in fodder or grain when all the water is driven off. A "narrow ration" means one in which the proportion of protein to carbohydrates is close—a "wide" ration means one which shows a larger proportion of carbohydrates.

Corn and Cob Meal; Calf Pasture.

1. A great many men in this section feed corn and cob meal to their cattle. I do not like to feed the cob. Is there enough nutriment value to supply energy to digest it? Does it pay to feed it? 2. I would like to know what to sow that will make good calf pasture the first year. I thought of sowing Soy beans, corn, and rye. Possibly you might suggest a change in the mixture. H. D. B.
Michigan.

1. There is no satisfactory data concerning the value of corncobs, and their presence in corn and cob meal is of very questionable value. B. E. Carmichael of the Ohio Experiment Station, in a letter to me says: "I think it can safely be said that the presence of the cob does not add to the actual food value of the material. The nutriment in corncob is so difficult of digestion that I do not believe that ground cobs, if fed alone, would prevent animals from starving to death." I have fed corn and cob meal to cattle for some time, mostly with good results but sometimes the cobs injured the bowels of the cattle, causing the passage of blood, which would stop when I changed to plain meal. I have solved the difficulty by attaching a sheller to the feed mill and shelling all corn fed, which may then be ground as fine as desired and at less expense than ear corn, besides we have the cobs to burn. When dry enough by all means shell and grind the corn fed to cattle.

2. Rye, oats and Canada field peas if sowed early would be good and later corn and rye sowed together ought to provide either feed or pasture, and perhaps the Soy beans would work in well or some rape if desired. For late Summer or Fall seeding rye and vetch if suited to your soil ought to give good late pasture and early pasture next Spring. Knowing well the destructive habits of calves I advise soiling, if possible, instead of pasturing. W. E. D.

Dairy Ration.

Can you give me a balanced ration of the following feeds with mixed hay for roughage: Mixed wheat feed $1.50 per cwt.; cornmeal $1.45; cottonseed meal $1.75; yellow gluten $1.65, or any other feed that you would consider cheaper to go with the mixed hay. My cow has shrunk in milk during Winter. How can I increase flow? F. R. P.

No doubt the cold weather during the latter part of Winter had a tendency to reduce the flow of milk, as it affects other animals the same way when they are deprived of natural conditions and expected to produce profitable returns during the period when they would naturally be unproductive in their wild or natural state, and which has been gradually changed by domestication. For a grain ration to be fed with mixed hay you could use the following mixture: Five pounds mixed wheat feed, two pounds cottonseed meal, two pounds oil meal, one pound cornmeal. You will notice that oil meal is substituted for gluten as you have no succulent feed and your cow will produce better results with some laxative feed like oil meal. C. S. G.

Feeds for Cows and Hogs.

1. Will you give me a balanced ration with clover hay and corn fodder for roughage, and with no silage? The following are the grain feeds: Bran, oilmeal, corn chop, sucrene dairy feed. I can get cottonseed meal; have never fed any of it. We feed for butter; cows will be fresh this Spring. 2. Are wheat and oats, equal parts by weight ground together, as good and as cheap as middlings for hogs? W. A. L.
Pennsylvania.

1. From the feeds you mention I would compound a grain ration as follows: Five pounds wheat bran; two pounds oil meal; two pounds cottonseed meal; two pounds corn chop. These ingredients should be well mixed together and fed in two feeds per day, morning and night. The quantity for each feeding must be regulated according to the requirements of each cow individually. Cottonseed meal is a very valuable ingredient for the purpose of furnishing protein, but care should be exercised not to feed any corn chop or cottonseed within at least three weeks after parturition, as it is liable to cause fever and caked udder. You should feed the clover hay twice a day, morning and night with corn fodder at noon—feeding liberally each time.

2. I would prefer middlings for hogs in preference to wheat and oats ground together, equal parts, at the present prices at which each is selling. C. S. G.

Summer Cow Ration.

How and what should I feed my cow, from now until she becomes fresh, September 15? My hay is mostly Timothy, the pasture is nothing extra, no Fall feed. She is eight years old, weighs about 1,000, Jersey grade; she came fresh last October, gave 12 quarts of milk for about two months. She is giving now seven quarts a day. I am feeding her 100 pounds bran, 100 pounds ground oats, 50 pounds gluten, 30 oil meal, four quarts to a feed twice a day. W. R. S.
Vermont.

Your cow is doing very well, and getting a good balanced ration except the Timothy, which is not as good as mixed hay or clover or Alfalfa for the production of milk. You should gradually decrease the amount of grain you are feeding proportionately as the flow of milk decreased, so that you will be feeding only two or three quarts a day by the first of July, the amount depending entirely on the condition of the cow. She should be practically dry at that time, and should have no gluten or oil meal until at least three weeks after freshening. She should have plenty of good pasture range and if she keeps in good flesh on the available pasturage no grain would be needed during the period of about two months while she is not giving milk. C. S. G.

Ingredients for Balanced Ration.

Would you give me the ingredients for a balanced ration bearing about the proportions of one to six or six and a half? My roughage consists of mixed hay once a day, meadow hay twice; cows are Jersey, Holstein and grade Guernsey. Bran $1.60; middlings $1.60; mixed feed $1.60; cornmeal $1.60; gluten $1.60; hominy $1.70; linseed meal $1.90; ground oats $1.75; distillers' grain $1.75. In a piece of land once planted to potatoes, I spread two cords manure and expected to seed it down to Winter rye for feed, hoping also to kill out the witch-grass. It got too late to plant rye; now, would you advise Winter rye as soon as snow is off or put in Spring rye? H. A. K.

The following formula comes very near to your requirements: 20 pounds hay; four pounds distillers' grains; four pounds dried beet pulp; two pounds gluten feed; two pounds cornmeal; two pounds mixed feed. Oats are rather high priced for feeding now, and you will not require any oilmeal while you are feeding beet pulp. We would sow Spring rye now in preference to the Winter variety, as the chances would be better for a good crop. C. S. G.

Staggers.

I have a four-year-old heifer which was fresh last September. Everything was all right and she has been giving about eight quarts milk. Now she seems to have developed some nervous trouble. She will stagger when let out of the stable and will sometimes go around in a circle for quite a few minutes. She has nearly dried up, and has no appetite. Can you suggest the possible cause or a remedy? The heifer has always been in vigorous health. I am feeding hay and silage, and about six quarts ground feed twice daily.
New York. F. N. G.

Indigestion is the cause. Do not feed a milch cow over one pound of grain or meal mixture (concentrate) for every three or four pounds of milk produced. Physic the cow with Epsom salts and then feed good hay, a half feed of silage and far less meal than you have been giving. Grass, when ready, will be the best possible remedy. Allow her a box stall. A. S. A.

"AND what do you know about Moses?" "Please, teacher, it's my first Sunday here and I don't know anybody."—Punch.

DE LAVAL

as superior to other separators as other separators are to gravity creaming

WHY STOP HALF WAY IN BUYING A CREAM SEPARATOR?

THE ABOVE HEADING SUMS up the cream separator case, as it concerns every prospective buyer of a separator and every user of an inferior separator, in as few words as it could well be put.

OTHER SEPARATORS SKIM cleaner than is possible on the average with gravity creaming, and De Laval Cream Separators skim as much closer still than other separators, particularly under the harder conditions of cool milk, running heavy cream or separating the milk of stripper cows.

OTHER SEPARATORS PRODUCE a cream superior to gravity creaming, and De Laval cream is smoother, less frothy and so much better than the cream of other separators that De Laval made butter always scores highest in every important contest.

OTHER SEPARATORS SAVE time and labor over gravity setting or creaming of milk, and De Laval Separators by reason of their easier turning, greater capacity, easier cleaning and easier handling save a great deal of time and labor over other separators.

OTHER SEPARATORS SAVE their cost every year, as a rule, over gravity creaming, and De Laval Separators save their cost every year over other separators and last from ten to twenty years, or on an average five times as long as other separators.

DE LAVAL SEPARATORS COST a little more than other separators, but very little, and they soon save that small difference and go on saving it every few months, as other separators would go on wasting it, for all the years they last.

WHY THEN BUT HALF SOLVE the problem of best results and greatest economy in dairying by the purchase of an inferior separator or go on dairying with this important problem but half solved if you are already using an inferior separator that you might so easily replace with a De Laval?

THE SEASON OF GREATEST production is now at hand when all these differences count for most with every user who should have a separator and is trying to get along without one. No other dairy question is of anywhere near as great dollars-and-cents importance.

WHY NOT SOLVE IT NOW IN the only sure and safe way possible? If you haven't a separator, buy a De Laval. If you have a poor separator, replace it with a De Laval. If it is not convenient to pay cash you may buy a De Laval on such liberal terms that it will actually save and pay for itself.

Every De Laval local agent is glad of the opportunity to prove every claim here made. It will cost you nothing and may save you much to give him the opportunity. If you don't know the nearest De Laval agent simply address the nearest main office, as below.

The De Laval Separator Co., 165 Broadway, New York, 29 E. Madison St., Chicago

Wheat, bushels	835,840
Corn, bushels	32,200
Oats, bushels	435,200

Wholesale Prices at New York,
Week Ending May 8, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.50	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following premiums over contract prices were paid high-scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 5¼ to 5½ cents per quart. Two or three large milk concerns in New York are working up new restaurant trade on the basis of $1.85 per 40-quart can.

BUTTER.

The quality of fresh creamery receipts is averaging poor. There is a one-half cent advance on some of the top grades, and some slight improvement in market for best storage creamery. The medium grades of creamery are selling rather slowly, as buyers are unwilling to pay the prices asked. Dairy markets in Northern New York interior points are strong. Recent sales on the Utica Board of Trade have run within one-half to one cent of the same grades delivered at New York.

Creamery, extra, lb.	26	@	26½

Packing Stock	13	@	17

Elgin, Ill., butter market 25 cents.
Philadelphia, western creamery, 26 cents.

CHEESE.

Business in the better grades of new whole milk is improving. Some lots are held at higher figures than quotation, but 14 to 14¼ cover most sales of high scoring new.

Whole Milk, new, best	14	@	14¼
Old, best	18	@	19
Common to good	14	@	16½

EGGS.

The market is weak and one to two cents lower. The proportion of low quality in average receipts is larger than usual in many of the standard individual marks. Nearby white eggs are plentiful, very few selling above 22 cents. Duck eggs are lower and hard to sell. Several shipments of dishonestly packed eggs have been noted recently, the first two layers all right and the remainder culls or preserved eggs. Such shipments are usually sent to houses that sell by appearance, without careful candling of the whole case. Occasionally the man responsible for the deception gets paid the full price before the trick is found out, but he soon gets on a black list of undesirables, and the consequences are sure to be unprofitable for him.

VEGETABLES.

The market on old potatoes is dull, the top figures quoted being extremes. Large quantities of State and Western have sold 25 cents per 180 pounds lower, new potatoes from Florida are in good demand when of fair size. Several thousand sacks of Danish have sold within the range of $1.25 to $1.75, and occasionally a lot of inferior down to $1. Old onions are scarce and higher; new from the South in moderate supply. Cabbage receipts are large and prices lower. Green beans and peas running poor. Tomatoes low, except for choicest grades.

*

The seal catch from the banks of Newfoundland was 233,718, worth $498,086. This is the result of two months work of 4,000 men and 19 vessels.

*

Tomato pulp forms the base of many condiments. A company in Northern Ohio will this year have 3,600 acres of Tomatoes under contract for the manufacturing of pulp and ketchup.

*

Here is the programme of food deliveries made daily to a New York restaurant feeding about 1,000 people. At five a. m. the man with the rolls leaves two or three grain sacks of these, according to the order given the day before. Next comes a wagon with crullers, and another with corn cakes. Then the ice man arrives, followed by the fancy pastry delivery, eclairs, cream rolls, cheese cake and various knick-knacks. By this time the butcher is on hand with whatever was ordered—it may be a large chunk of roasting beef, corned beef, a dozen hams, lamb chops, etc. Before the butcher gets away, the milkman arrives and leaves two or three cans. Next is the pie wagon with regular stock of standard-built pies, about 60 nine-inch ones, to be cut in quarters and sold at seven cents a slice, and 25 dwarfs selling at five cents for a half. Another baker brings the pumpernickel, a dozen loaves or more, and last of all comes the man with charlotte russe. A tally of the various tradesmen named above will show seven different bakers, specialists, handling what in former years one bakery was supposed to stock.

W. W. H.

"Now, Henry," said Mrs. Tomley, "I want you to be good while I'm out." "I'll be good for a penny," replied Henry. "Henry," she said, "I want you to remember that you cannot be a son of mine unless you are good for nothing!"—Credit Lost.

The Powerful Smalley Cuts Silo-Filling Cost!

The day of the old slat-apron silo filler is gone. No wise farmer is going to use one when he can get a money-saving, grip-hook, force-feed SMALLEY, that does the work quicker, easier and at less cost. It handles silage, cow peas or alfalfa in a hurry. Cuts it fine and uniform. Packs silage tighter—gives more tonnage.

No Power Waste

One pulley and chain-drive on blower outfits replace power-wasting idlers.

1914 Carrier

A 5 H. P. Engine will run a No. 12 force-feed and our 1914 enclosed carrier. Special alfalfa grinding screen furnished extra, protected by screen patent No. 721,246. Make your own meal.

Send postal today for latest Smalley catalog.

The Henyard.

Turkey With Swollen Head.

I have a young hen turkey, that has soft white bunches, or swellings, on each side of head, under the eyes, along the side of bill. We have bathed them with camphorated oil, also kerosene, but they seem to be getting larger. She seems to be lively, and eats all right, but I am afraid trouble is contagious, as I have three others running with her. Can you tell me the cause and remedy?

New York. M. B.

The socket containing the eyeball is lined by mucous membrane continuous with that of the nasal passages. Catarrhal inflammation sometimes extends to the eyeball socket and causes an accumulation of thick cheesy mucus beneath or about the eye, producing a more or less prominent swelling there. If this swelling does not subside of itself it may be opened with a clean sharp knife and the contents gently pressed out; after which the wound may be dressed by applying an antiseptic, such as carbolized vaseline in 5% strength. M. B. D.

Installment Incubation.

Having seen the discussion in your paper in regard to eggs at different stages of incubation in the same incubator, I am giving our experience. For the past three years we have been supplying private trade, and could not get enough surplus eggs to fill a machine all at once, so tried putting in 100 eggs, or a trayful each week in each of two three-tray 300-egg incubators, and have had success. We do not test out, and our average has been slightly over 75 strong chicks out of each 100 eggs by this method. This is about the same as we averaged by the old method of filling the machine, and I cannot see any difference either in number or quality of chicks. T. H. L.

West Nyack, N. Y.

Silage and Buckwheat for Hens.

Is it well to feed corn silage to laying hens? They seem fond of it. Is buckwheat good in connection with other grain? E. A. A.

New York.

Corn silage is a good feed for fowls, and buckwheat is also excellent as part of the grain ration; better, the writer thinks, than it is usually credited with being. It is particularly valuable in the Winter when its heat producing qualities are most needed. M. B. D.

Feeding Laying Hens.

I was interested in what Messrs. Stone and Matthews had to say, on page 615, regarding feed for chicks. Lest some may think there is no other side to this question, I wish to quote from a recent address of Professor Atwood, of the West Virginia Experiment Station.

"Of all our domesticated animals, baby chicks stand in a class by themselves in respect to their rapidity of growth. Chicks when hatched weigh about one and one-half ounces each, and they can be made to weigh 2½ pounds, or 40 ounces apiece, when 12 weeks old. This is an increase of slightly more than 26 times the original weight in 12 weeks. In other words, during the first 12 weeks of its life a little chick averages to increase in weight each week more than double its original weight. Let us see what this means, taking for example a young child. If a baby weighing 10 pounds at birth were to grow relatively as fast as a chicken, it would weigh 260 pounds when 12 weeks of age! This extreme rapidity of growth in the case of a chicken requires liberal feeding, and I have never yet been able to understand why the advice is so frequently given not to overfeed little chickens, for if the chicks are healthy and are given an opportunity to take a normal amount of exercise, they will not eat more than they can properly digest and assimilate. A baby, under normal conditions, doubles its original weight in about 180 days; a chick, in about six days. In other words, the process of digestion and assimilation are about 30 times as active in the case of a chick as in a baby, and the amount of food required is about 30 times as great, in proportion to the body weight. Liberal feeding is the keynote of success in feeding little chicks.

"As stated above, the advice is frequently given to feed chicks scantily during the first few days or until the contents of the yolk sac is fully absorbed. This advice is like much other that is founded entirely on theory. It is true that there is a considerable amount of nutritive material stored up in the yolk sac in the case of a chick just hatched, but nature has provided this reserve material to supplement, but not to take the place of other food materials that the chick is able to get by its own efforts or by the efforts of the mother hen. In passing, it may be well to say that this view of early and liberal feeding is apparently being adopted more and more widely by the most successful men in the poultry business.

"Admitting that the baby chick should be fed liberally and as soon after it is hatched as it desires food, the question at once arises, what shall it be fed? The fact that a chick doubles its original weight in about six days gives us some very valuable information on this subject, for it has been proved, in the case of animals that suckle their young, that the composition of the mother's milk varies directly according to the length of time required for the young to double its original weight * * * The more quickly the young animal doubles this weight, the more protein and ash constituent it receives in its ration. In fact, we might naturally expect this to be the case, for if the body of an animal is to be built up quickly, it stands to reason that the ration should be concentrated and contain an abundance of protein to form flesh, and ash constituents to form bone."

It is not for me to say whether Professor Atwood is right or not If he is right, then the chick should be fed liberally from the time it begins to crave food, furthermore the ration should be concentrated from the start A friend of mine, who has been raising chickens for over 20 years purely from the love of it, has had such remarkable success that if he were an advertiser rather than an amateur, he would be known from one end of the country to the other. His chicks are never allowed to go hungry from the time they are taken from the incubator, and from the start they are fed a concentrated ration. Every natural craving is thus met from the beginning, and in the Fall the fowl's bodies are so replete with substance and vigor that they beget egg records that are very wonderful to me. And they win the better in this race, I am inclined to believe, just because they do not receive the check of semi-starvation during the first two or three days of life. I may add that I have had the same trouble Mr. Stone experienced, and many times—even when I starved the chicks for 48 and (in some cases) 72 hours before feeding. Perhaps some other factor than feeding has entered in, both in his use and mine. In fact, it seems more reasonable to me that chilling, rather than feeding, may cause the non-absorption of the yolk-sac. Does not the successful mother-hen feed her chicks from the start?

MELVIN BRANDOW.

A SPEAKER, in the course of a tirade against the universities and education, expressed his thankfulness that he had never been corrupted by contact with a college. "Do I understand that the gentleman is thankful for his ignorance?" asked one of his audience. "Well, yes," was the answer, "you can put it that way if you like!" "Well, all I have to say," said the interrupter, "is that you have much to be thankful for!"—Melbourne Australasian.

The Henyard.

THE EGG-LAYING CONTEST.

The twenty-sixth week of the egg-laying contest at Storrs shows a falling off in egg production, as was to be anticipated. The hen thinks the weather is warm enough now, so she ought to be raising a family. The worms are up, the grass has started, and all the other birds are doing it, so she stops laying eggs and gets broody. Does her *will* have anything to do with this? Does she stop laying *because she wants to become a mother?* Or does she become broody because she has laid out that clutch of eggs, and the next clutch are not ready yet? In one of my Leghorn houses there is an old Orpington hen that hatched some chicks for me last Summer. After the chicks were weaned I put her in the Leghorn house. She laid up to last of December, then wanted to sit. I let her sit, after vainly trying to break her up. She "set" on a nest egg from last of December until middle of April. I used to take her off nearly every day, and she would talk to me constantly while I was within hearing, not scolding, as a sitting hen usnally does, but a gentle crooning. I would pet her and talk to her and we really enjoyed each other's society. When I changed her nest egg to another nest she would hunt for it until she found it, then go on that nest. I let her do as she pleased, and she mothered that egg for nearly four months. Now her head is getting red, she has given up trying to hatch that egg, and will be laying soon. In her case that "next clutch of eggs" has ceased to develop for about four months.

Tom Barron's pen of White Leghorns come to the top this week with a score of 56—their total is 763. His Wyandottes laid 42, and their total is 1,075.

Merrythought Farm's White Wyandottes take second place with a score of 55. Three pens laid 54 each. They are A. B. Brundage's S. C. Reds; pen 42 of Storrs Agricultural Station, White Leghorns, and the Buff Leghorns from Wolverine Poultry Farm, Grand Rapids, Michigan. Storrs Station pen No. 41 of White Leghorns laid 53, and A. B. Hall's pen of same breed also laid 53. Below is the week's record:

GEO. A. COSGROVE.

Ailing Chicks.

Can you tell me what is the matter with my three-weeks-old chicks, and what to do for them? I have used the ax so far. The first sign of the disease is weakness and stiffness in the legs. Later on they walk with their heads down and cannot straighten up. The only part of chick that grows is the back and under bill. Their droppings are all right until the later stages, when they become a watery yellowish white. Chicks always have plenty of grit, sweet milk and water before them. A. F. C.

Orleans Co., N. Y.

The lack of vitality shown by your chicks in their stunted growth, weakness and diarrhœa may be partially due to lack of inherited vigor because of weak parent stock and partially to improper brooding and feeding. Without knowing more about these things it is impossible to say where the trouble lies with your chicks. You do not mention the use of soft mash food which is essential for best development of young chicks, and you speak of feeding sweet milk; the feeding of soured milk is to be preferred as it not only contains all the nutriment of sweet milk but in addition has the property of preventing, or at least retarding, the development of certain causes of diarrhœa. M. B. D.

Too many chicks die young

Let's apply common sense to the feeding of chicks. They have tender stomachs. Their digestive organs are delicate. *They should not be fed raw grain.* Their feed should be *steam-cooked* to prepare it thoroughly for assimilation. The only chick feed that is steam-cooked is

H-O Steam-Cooked Chick Feed

This feed is a scientific mixture of Corn, Cut-Oatmeal, Cracked Wheat, Kaffir Corn, Peas and Millet—*steam cooked* by a special process in our mill.

Sold only in 10-lb., 25-lb., 50-lb. and 100-lb. bags, with tag showing guaranteed analysis. If you cannot get H-O Steam-cooked Chick Feed, Intermediate Scratch, Scratch Feed, Poultry Feed, Dry Poultry Mash or Chick Feed, from your dealer, write for sample and prices.

The H-O Company, Mills: BUFFALO, N. Y. | John J. Campbell, General Sales Agent, HARTFORD, CONN.

PUREBRED TOM BARRON STRAIN
WHITE LEGHORN EGGS
Price reduced to $1 per 15 after June 1st.
MAPLEDALE EGG FARM, - Erin, New York

POULTRY HOUSE ROOF

is a very important part of the building. Poultry is very sensitive to dampness. Leaky roof may affect the whole flock causing colds and roup. To insure protection to your flock cover your houses with

"RAIN-TIGHT" RUBBER ROOFING

It is composed of **Trinidad Lake Asphalt**—The Standard asphalt of the world—no other "Secret combinations" that sound "big" but mean little. Nature made it, and took her time about it. That's why it lasts. Our brand of **"Perfect Roofing"** is the same as **"Rain-Tight"** with mica flakes added to the surface which make it fire-resisting. It is a non-conductor of heat and lightning and insures against fire from sparks falling on the roof,

PERFECT ROSIN SIZED SHEATHING AND PERFECT TARRED FELT ARE BEST FOR SHEATHING PURPOSES

If you need a new roof for any building, now or in the future, it will pay you to send for samples and booklet—write us today.

MAURICE O'MEARA CO., 448 Pearl Street, New York City

The VIBERT REDS

A flock of deep glowing and *brilliant cherry to mahogany red* to the skin rose and single comb Rhode Island Reds, famous for being *the heaviest-laying trapnested flock* of the breed in existence. Long-backed, low-tailed birds, hatched and raised by hens only on absolutely free range in open-front colony houses wide open all winter. A plant on which *roup and white diarrhœa are entirely unknown.*

Highly fertile, strong eggs for hatching the year round. Chicks in small lots from specially selected eggs. Cockerels from trapnested hens of high laying rates. Breeding pens, trios, and utility stock for sale at reduced Spring prices—

all from
THE HEAVIEST-LAYING REDS IN AMERICA

Prompt service, courteous and honorable treatment, backed by a national reputation for square dealing. 1914 mating booklet upon request.

VIBERT RED FARM, Box 1, Weston, N. J.

INT'L EGG-LAYING CONTEST

PUBLISHER'S DESK

We still get occasional letters from people who, either by accident or design, neglect to sign their names. For various and sufficient reasons it is impossible for us to give attention to such letters. If the subject is not important enough to you to justify the signing of your name to what you have to say about it, then let the subject rest.

There are others, I presume, like the Sterling Debenture Corporation scamps, who wish you would suspend publication. But keep up your good work. Scare the scamps. E. V.
New Jersey.

It is not a particularly easy job to scare the scamps. So long as the people put up easy money on their schemes the seamps will take chances; but we want at least to protect our own people and others when we can. Now and then the scamps get a jail sentence, but the people never get back the money they give up to them.

The Record-Herald has decided to eliminate liquor advertising from its columns. It will fulfil its existing contracts to print this class of advertising and having done that it will accept no more.

Advices from down-State indicate that the women of Illinois, newly enfranchised, will vote hundreds, possibly thousands, of saloons out of Illinois villages, towns and cities next Tuesday. Every important city in the State except Chicago, Peoria and East St. Louis will vote on local option. Anticipating this election, the Record-Herald's announcement is believed to carry much significance regarding the drift of sentiment on the liquor question in Illinois.—Chicago Dispatch.

Publishers give up the revenue from liquor and other objectionable forms of advertising reluctantly; but the list of clean publications is growing with or without the ballot. Women's influence will always be on the side of cleanliness and decency.

Your letter with check in settlement of my claim against Adams Express received. I thank you for the interest you took in this matter and am pleased to know that in THE R. N.-Y. the common people have a court of last resort. I am enclosing $2.30 for two new and three trial subscriptions. E. H. B.
Massachusetts.

That puts the obligation on us. Our people usually do their part and throw in a little for interest and good luck.

I saw an advertisement in a local paper wanting women to do sewing at home. I answered it and got a reply by return mail offering good wages for making aprons. They wanted $3 at once for goods, and would pay me $2 per hundred and pay for goods. My bill was $14. I have heard nothing since. The address was Supply House, Cleveland, Ohio. Can you help me? E. L.
New York.

Our letters addressed to the United Supply House were returned stating they had moved and left no address. All these work-at-home concerns are fakes and about the meanest fakes we know. They scheme to cheat the invalids and cripples.

A. D. Bradley & Co., 193 Reade Street, this city, received shipment of eggs from one of our subscribers but neglected to send check for $24 to cover same. The information now is that they have moved and we are unable to locate them. Bear them in mind if they solicit shipments from another address later.

Joseph Wewer and Rudolph Menzer, saloonkeepers at Washington Ave. and 163d St., the Bronx, were sentenced yesterday to Blackwell's Island for a year and a day each by Judge Thomas in the Federal District Court for using the mails to sell "love powders" and "mystic rings." They were convicted on the testimony of "Professor" Aspra Gatalica, known as Frank Serkulj, alleged leader of the conspirators. Serkulj pleaded guilty and said that Wewer and Menzer furnished the circulars and stamps and got most of the profits.—Daily Paper.

Farmers do not run into the mystic game very much; but it may interest them to know for what purpose their mail service is used at times, and what progress the department is making to confine it to legitimate uses.

I had over 30 replies to my bone cutter advertisement, and so secured a good one at less than 50% of cost originally.
New York. H. W. H.

This refers to a little notice for a second-hand bone cutter in Subscribers' Exchange. It would be too much to expect that every person would find just what he wants or find a customer for what he wishes to sell, through this department; but there are 160,000 members in THE R. N.-Y. family, and each paper seems to be read by five people on an average, so it would seem that the requirements were broad enough to satisfy any situation.

I wish you would see if you can collect the enclosed bill for me. The Key City Nursery Company, 180 Bennett Street, Dubuque, Iowa, ordered these plants from me last Spring. I shipped them on April 12 and they promised to pay for them June 1st. I have sent them several bills but they have not paid nor have they answered my letters. B. P.
Delaware.

This was a small bill of $3.50, but with such a record none of our people will want to ship plants on orders from the Key City Nursery Co. We were unable to get any reply to our letters and the collection was not made.

Enclosed you will find a slice of fresh bacon. Please roast the same and serve to your numerous family of subscribers.
Connecticut. A. A.

This is a proposition by Mr. N. W. Bacon, 120 Boylston Street, Boston, Mass. He wants to give our friend a city lot all for nothing. With the free lot he throws in enough guff to arouse the vanity of the average man, but he seems to have made this "selection" of a distinguished citizen without taking the pains to get acquainted with his man.

Please place my name on your records as a member of Dr. Ulman's "Fake Detection Association." I hope the membership will run into millions.
New York. C. R. C.

The name is recorded. A remarkable thing about the charter members of this association is the high class of business and professional men and farmers who send in their names. The number does not increase so very fast, but the high standing and intelligence of those who signify their willingness to become members is significant.

Mr. Frederick G. Gammeck of West Hartford, Conn., testified to a personal experience in the libel suit of F. O. Groesbeck, Hartford, Conn., against THE R. N.-Y. in the Federal Court last month. Mr. Gammeck told Mr. Groesbeck that he expected to buy a breeding cockerel from a man named William Davis. Groesbeck, so Mr. Gammeck testified, claimed that he knew Davis and could buy the bird cheaper than Gammeck. Later Groesbeck reported that he could get a bird for $2 or one for $3; or a still better one for $5; and the latter was ordered. The bird, however, proved unsatisfactory and after repeated efforts to get an adjustment through Groesbeck, Mr. Gammeck got in touch with Mr. Davis, and found that the bird was an ordinary mongrel, and that Groesbeck paid $1.50 for it. Gammeck found that he paid Groesbeck a profit of $3.50 on a $1.50 rooster.

It is possible to get one or two sympathizers of crooks on a jury of 12 men anywhere; but thank goodness it has not yet been demonstrated that it is possible to find 12 crook sympathizers in one case.

I have been confined to the house four months with neuritis, and am just able to hang on to a pencil with my left hand, but I want to ask what you know about this medicine, Sanatogen. I had a little faith in it, seeing it advertised in the Christian Herald and recommended by such men as Henry Watterson and John Temple Graves, but before buying it I consulted a nerve specialist who had been called in my ease. I enclose a letter telling what he thinks of it, also a letter from the Bauer Chemical Company.
Pennsylvania. L. L.

The letter from the nerve specialist said "Sanatogen" had been carefully analyzed and that it was simply cottage cheese, its only virtue being the fact that it is harmless, and that it had absolutely no medicinal value. While the letter from the proprietors of "Sanatogen" intimated that the preparation would cure tired nerves, the only definite thing in it is the information that "Sanatogen" may be had from druggists in three sizes, at $1, $1.90 and $3.60.

It was our previous information that "Sanatogen" contained some combination of phosphates in addition to the cottage cheese, and that the cost of the materials of the dollar size was about eight cents at the outside. We have never found a chemist or a physician to credit it with any medicinal value. J. J. D.

It needs no painting

THOSE neat sparkling roofs with their crushed mineral shining in the sun—you see them all over the country—they are Amatite roofs.

The fact that Amatite *needs no painting* means a great saving to those who use it.

It is also a great convenience not to have to paint roofs.

Many buyers have adopted the policy of using nothing but Amatite owing to this economy and satisfaction.

A booklet about Amatite will be sent free on request.

DIRECT FROM MILL AT MILL PRICES

Rock Bottom Steel Roofing Prices

Positively the greatest steel roofing proposition ever made. Before you invest in new roof covering, siding or ceiling for any building first learn about the *one* best and cheapest.

Edward's TIGHTCOTE Steel Shingles

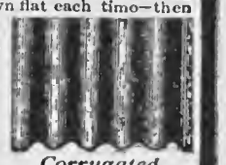
Reo Shingles

actually cost less and *outlast three ordinary roofs*—last a lifetime—when the building wears out you still have the roof—never needs painting or repairs. It is *rot-proof, fire-proof, rust-proof,* and guaranteed *lightning-proof.* Any one can lay it, right over old shingles if you desire.

How To Test Galvanizing

Take any other piece of galvanized metal, bend it back and forth three or four times, hammer it down flat each time—then take your finger nail and flake off the loosened galvanizing. Make this same test with the Edwards TIGHTCOTE Galvanized Steel Roofing. Not a bit will flake off—proves it cannot wear out.

By Edwards Patent Interlocking Device, see illustration below, nails driven through underlayer of metal only—no exposure—no leaks.



Corrugated

LOWEST PREPAID FACTORY PRICES

We manufacture Edwards Reo Steel Shingles, Roofing, V-Crimped, Corrugated, Standing Seam, Siding, Ceiling, etc., painted or galvanized. Sell direct from the largest factory in existence, at rock-bottom prices, pay freight charges, give permanent guarantee against lightning losses.

Ration for Milch Cows.

1. Can you give me a balanced ration for fresh milking cows from the following grain? Cottonseed meal, cornmeal, wheat bran and brown middlings. 2. Can yellow ochre and glue be mixed for floor paint and what proportions?

R. W. F.

1. You can make a very good grain ration for fresh cows by mixing the grains you mention in the following proportions: Four pounds wheat bran; two pounds cottonseed meal; two pounds cornmeal, one pound brown middlings. Whether this will constitute a balanced ration or not depends upon the roughage available. If you have good mixed hay and clover it will produce very satisfactory results but some form of succulent feed should be added such as ensilage or dried beet pulp if the best results are to be obtained. 2. You could mix yellow ochre and shellac for floor paint but yellow ochre and glue would not be good for anything as glue will not stand water.

C. S. G.

Timothy for Cow.

Will you advise a ration for a mixed herd of cows where the milk is bottled and good color of cream is desired? I have for fodder some good Timothy and the kind of fodder raised on farms where it has not been seeded down for years; do not know what name one should give it, although some people call it "fine cow hay"; bran, protein 14½%, $1.45; wheat feed, protein 15%, $1.50; distillers' dried grains, $1.55; gluten, $1.55; cottonseed $1.75; meal $1.40. W. P. V.

Pennsylvania.

You cannot expect to obtain very satisfactory results by feeding Timothy hay to milch cows. You would do better to feed this to your horses and use only your "fine cow hay" for the production of milk. For a grain ration you could use the following: Four pounds dried distillers' grains; two pounds wheat bran; two pounds cottonseed meal; two pounds oil meal or four pounds dried beet pulp soaked before being mixed with other feed. If your cows are very thin in flesh you could add two pounds of cornmeal to this mixture and feed as much to each cow as she requires, regulating the amount according to her ability to eat and digest the feed eaten and the amount of milk she is giving. Do not feed cottonseed or cornmeal to cows within two months before parturition or two weeks thereafter. C. S. G.

Ration for Cow.

Will you give balanced ration for cows for me, using the following feeds? Corn silage; mixed hay (clover and Timothy); cornmeal $1.55; gluten $1.70; cottonseed meal $1.90; bran $1.55; linseed meal $2 per cwt. C. F. J.

Pennsylvania.

For the production of milk we would advise the following grain formula: Five pounds wheat bran; two pounds cottonseed meal; two pounds cornmeal; one pound gluten feed. This should be mixed thoroughly together and fed in two feeds, morning and evening, with about 40 pounds of silage divided between the two feeds. The noon feed should be mixed hay, feeding just what will be readily eaten without much waste. The amount of silage and grain to be fed to each cow must always be regulated by the appetite of each cow and the quantity of milk she is giving. C. S. G.

Promoting Heifer's Growth.

I have a heifer which has had a calf six months too soon, as she is only 19 months old. Can you tell me a combination of feed that will increase her size instead of her milk supply?

New Jersey. M. R. T.

The same kind of nutriments are used for both milk production and animal growth, therefore your only course is to feed the heifer a ration sufficiently liberal to provide for both milk and growth. Keep the heifer in good smooth condition, but not fat. It will be better not to breed her for about six months from the time she freshened, but keep right on milking her until about two months before she freshens again. C. L. M.

AILING ANIMALS.

Warts.

I have a yearling bull which has two clusters of warts, one on the top of his neck just in front of his shoulder, about 20 in number; another cluster on the knee and ankle of his left forward leg, about 15 in number. One neighbor said castor oil would remove them, but they seemed to grow. Another said one tablespoonful of soda and one-half teacupful of vinegar would kill them, but it does not. Can you give me some advice what to do? J. B. H.

New York.

Castor oil well rubbed in once a day is an excellent remedy for masses of small warts upon the udder or on the muzzle. Large warts of cattle should at once be twisted out and the bleeding stopped by applying a hot iron or Monsels solution or powder. If they cannot be removed in this way they should be cut out. A. S. A.

Snuffles.

We have lately lost five shotes weighing in the neighborhood of 75 pounds each. They were first attacked with a cough, which gradually diminished but did not wholly leave them. Their heads swelled, eyes were bloodshot, had great difficulty in breathing, grew thinner each day as each succeeding day found them eating with greater difficulty. I finally killed them and had a veterinarian examine one of them, and he pronounced it osteo-porosis, as the cheek bones were excessively enlarged by a soft bony growth which could be easily sliced off with a knife, this growth pressed against the wind-pipe thereby causing the difficulty in breathing. He claimed there was no known cause for this growth, neither was there any known remedy. We feed a mixture of wheat middlings, bran and meal. The swine have access to salt and charcoal though they do not eat much of it. The pens are kept clean. The hogs are purebred Berkshires. Will you inform me if there is a known cause and a remedy? E. F.

Massachusetts.

The disease is not osteo-porosis, but is maxillary rachitis (rickets), commonly termed "snuffles" or "bullnose" (French: "reniflement," German, "schnufelkrankheit"). The disease is due to malnutrition (disturbance in metabolism) and is most likely to attack pigs of pampered sows. A deficiency in lime salts in the drinking water and feed is to be suspected as a contributing cause. Preventive measures consist in making the sows live a natural life, out of doors as much as possible and fed on mixed rations including 10 per cent. of digester tankage. Precipitated phosphate of lime should be mixed in the feed daily for sows and pigs. Lime water may be added to the milk or slop and sows given free access to wood ashes, charcoal and slaked lime. Avoid heavy feeding on corn. Confinement to pens is especially dangerous for both sows and pigs. Worms should be combated by the usual remedies. The disease is incurable so that affected pigs should be destroyed and burned. Affected stock should not be retained for breeding purposes. A. S. A.

Age Limit for Guineas.

How many years will a Guinea hen lay her usual number of eggs and at what age does she cease to be profitable? Can a Guinea rooster be kept to the same age or must I keep young males? I have never found anything on this subject in poultry books. E. T.

Mt. Kisco, N. Y.

Guinea hens usually are prolific layers until they are eight or 10 years old. Male birds should be renewed every four or five years.

Leg Weakness.

My hens seem to have some disease which affects them so they cannot walk; have had three or four out of 200 pullets hatched last season go that way. All have recovered so far except one, whose bones seem to be very soft. They also lay some soft-shelled eggs. I feed cracked corn, oats, wheat, buckwheat for whole grain, mixed feed, cornmeal, beef scraps, charcoal for mash; also sand and grit.

J. L. W.

Leg weakness in mature fowls is thought to be due to rheumatism contracted in damp drafty quarters, or to close confinement and heavy feeding during the Winter months. If the conditions at fault can be corrected, most cases recover without special treatment; in other cases, a good physic, like a teaspoonful or two of castor oil, is all that is necessary to put them upon their feet agan.

M. B. D.

Feed for Laying Hens.

I have 30 laying hens which average about 12 eggs a day. They are fed a scratch feed three times a day, consisting of 13 pounds oats, 20 pounds corn and 36 pounds wheat; this mixture lasts one week. There is a dry mash before them all the time, consisting of the following: Cornmeal, 15 parts; animal meal, 16 parts; Alfalfa meal, 16 parts. There is oyster shell, charcoal, and grit in hoppers before them at all times, as well as tepid water. A large armful of meadow hay is put in the coops every other day on top of the litter. The house is 20 by 10 feet, and has the Cornell system of nests and roosts. Can you tell me how I can increase my egg production? They are all White Wyandottes, hatched May 1st, 1913. I will be very thankful for any information on the subject.

G. H. R.

A dry mash consisting of practically equal parts of corn meal and Alfalfa meal is not well balanced as it contains too much protein in proportion to the carbohydrates, and too much of it in animal meal. A better mixture would be 100 pounds each of wheat bran, middlings, gluten feed, and cornmeal, to which is added 50 pounds of animal meal and one quart of salt. Clover hay would be far superior to meadow hay, and some green food should be provided if possible. If nothing else is at hand, dried beet pulp, which can be purchased through any feed dealer, is a fair substitute. Whether this system of feeding will increase your egg output no one can say, but it is a better one than that you are using, and should give better results.

Turkey With Swelling.

Some time ago I wrote to you asking what I should do for a turkey that had swellings on face. I received answer and followed directions but she does not improve. We opened the swelling and pressed them out and used carbolic vaseline, but they fill right up again. I also took some peroxide diluted with boiled water and syringed it out. There is a discharge from one of the eyes. Is there anything else I can do and was it all right to use the peroxide? Would you kill the bird? Would she be fit for food? She eats well, seems well enough otherwise. M. B.

Your treatment with hydrogen peroxide is good and it will probably be still more efficacious if, after syringing out the pus cavites, you fill them with some dry antiseptic powder, like iodoform, aristol, or boric acid. The nostrils and cleft of the mouth may well be syringed out with the peroxide also, if there is any discharge from them. If the turkey is a vigorous one, eating well, and apparently does not suffer from the local affection, it would seem a pity to kill her at the beginning of the breeding season.

M. B. D.

GETTING RID OF GREY SQUIRRELS.—The reader who writes on page 521 about them, will find that whole corn soaked in water poisoned with strychnine crystals, will kill the squirrels off rapidly, with little danger to birds that he cares for. Robins do not touch whole grains: blackbirds and crows will. Sprinkle the corn about the edge or edges of the patch adjoining the grove where the squirrels stay, late in the evening, when there is prospect of fair weather. Some put it out late in the afternoon, when they will get it for their last meal. But finding it in the morning is best, when they are out for breakfast before people are stirring to frighten them. I have seen them dead by the dozen in the West, where settlers are annoyed by them, particularly if a patch adjoins a forest or small grove of trees. The plan may not work if this man's, or his neighbors' fowls have access to his fields.

T. C. P.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

HUMOROUS

"WHY is the weather so fascinating a topic of conversation?" "Well," replied Farmer Corntossel, "I suppose it's because it's one of the few subjects of general interest that you ain't supposed to read about in 'The Congressional Record' before you can pretend to understand it."—Washington Star.

"So," said the visitor, "you intend to become a physician, when you grow up." "Yes, sir," said the youth. "And why have you decided upon the medical profession?" "Well, a doctor seems to be the only man that keeps on getting paid whether his work is satisfactory or not."—Ladies' Home Journal.

LITTLE Marie was sitting on her grandfather's knee one day, and, after looking at him intently for a time, she said: "Grandpa, were you in the ark?" "Certainly not, my dear," answered the astonished old gentleman. "Then why weren't you drowned?"—London Evening Standard.

"Go and see if there are any crows in that field of corn," said the farmer to the new plow boy. The boy went out, and came back with the news that he had counted fifty-four. "Did you drive them away?" asked his master. "No, sir," replied the boy, "I thought they were all yours."—Melbourne Australasian.

LITTLE Prescott had been leaning out of an upstairs window. "Come away from the window, son," his father said sternly. "You might fall out and get a hump on your back—like the camels you saw yesterday." The little boy was silent for a few minutes. Then he asked: "Father, do all the little camels have to fall out the window to get their humps?"—New York Evening Post.

UNCLE Luke had been over into Calhoun County to see the son of his old master, now grown to ripe age and judicial office. "Luke, how does Mr. John look?" asked the old gentleman. "He's getting stout, eh?" "Yas, suh," agreed Luke. "Ah will say dat w'en Ah saw Mas'r John ev'y button on his wais'coat was doin' its duty, sah."—New York Evening Post.

THE cemetery fence had been destroyed by a bush fire, and subscriptions were being taken up in the district with the object of erecting a new one. "I don't see as how I should," replied an old farmer, when asked for a donation. "What's the good of a fence around a cemetery, anyhow? Those who are in the cemetery can't get out, and those who are out don't want to get in."—Melbourne Australasian.

THRIFTY housewives are now taking measures to keep the housefly from the domicile, so as to avoid the perplexing problem of getting rid of them. "Flies," remarked one woman recently, "are a tremendous nuisance. When one gets into a cup of coffee it makes me fairly miserable to see it." "Makes you miserable!" exclaimed her listener. "Well, don't you think it makes the fly more so?"—New York Tribune.

A YOUNG lady returned to her home in a small Maryland town after a Winter in Baltimore, and was told that her old colored laundress had just died after a brief illness. Shortly afterwards Aunt Annie appeared, quite alive, and looking for work. "Why, Aunt Annie!" said the astonished girl, "I am so glad to see you. I heard you were dead." "Yes, honey," said the old woman, "Ise done hyeard dat too, but I neber did believe it."—New York Evening Post.

No-Rim-Cut Tires
Dropped 28%

During 1913 No-Rim-Cut tire prices dropped 28 per cent. They dropped so fast, so far, that 16 makers have declined to follow.

Now comes this situation:

Sixteen makes of tires are selling higher than Goodyear prices. Some are nearly one-half higher. Higher, mark you, than No-Rim-Cut tires—the tires which once cost one-fifth more than other standard tires.

The Reason Is—Mammoth Production

The difference lies in quantity. In this new factory with its new equipment we are building up to 10,000 motor tires per day. Perhaps twice as many as the largest rival plant.

Factory cost has dropped immensely as our output multiplied. And every saving goes to you. Last year our profit averaged only 6½ per cent.

Those are the only reasons why we undersell sixteen other makes.

Extra Features

In fabric and rubber we give you in Goodyears the best tire men know how to build. Our experts have tried a thousand ways to lower cost per mile, and they say that these tires mark the present-day limit in low cost per mile. It is simply unthinkable that any maker has learned a better way to build tires.

We give you in addition four great features found in no other tire.

We give you the No-Rim-Cut feature, which we control, and which has ended rim-cutting completely.

We give you the "On-Air" cure, which saves the countless blow-outs due to wrinkled fabric. This one extra process adds to our tire cost $1,500 daily.

We give you a method—controlled by patent—which lessens by 60 per cent the risk of loose treads. And we give you the double-thick All-Weather tread, the one anti-skid which runs like a plain tread—which is flat and smooth and regular.

No-Rim-Cut Popularity

No-Rim-Cut tires, even when high-priced, came to outsell any other. And now, after millions have been put to the mileage test, we are selling 55 per cent more tires than in any previous year.

They offer you the utmost in a tire at the lowest price possible now. At a lower price than 16 other makes.

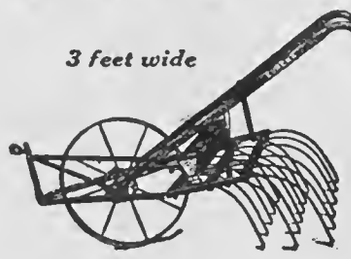
A New Seeder—Between Rows

3 feet wide



Reduces Labor and Assures Better Results Than From Any Other Method or Machine

For seeding and *covering seed* between rows of corn, etc. Sows clover, timothy, rye, wheat, oats, buckwheat, etc. 17 flat teeth cover the seed to any depth desired and leave the field level. Wind does not interfere. Seeder meehanism and teeth same as used on our large machines for 10 years. Aceurate and adjusts for various quantities.

Eureka One Horse Mulcher and Seeder

also forms dust muleh and kills weeds. It is an ideal cultivator for farm or garden. Works close to small plants. Any of the teeth can be removed. Light weight with greatest strength—all parts of steel or malleable iron, exeept handies. Easily operated. Low price. Send for free catalog.

Chas. C. Gelder, Princess Anne, Md., says:—"My stand of Crimson Clover sown in over 60 acres of standing corn in 1913 by the Eureka One Horse Seeder was the best and most uniform I have ever had."

EUREKA MOWER CO., Box 1200, Utica, N. Y.

Jacobson Engines
Sturdy Jack

A sturdy little 2 H. P. Engine. Just the thing for seores of farm jobs—pumps, runs the wood saw, separator, washing machine, etc., and all the lighter machinery. Pumps 2,000 gallons for a cent. Starts easy and sure. Mounted on hand truck—push it around like a wheelbarrow. Runs without fastening. Firm as a rock. Does *not* have to be propped up. Air or hopper cooled. Material and workmanship—faultless! Price—reasonable! We also manufacture engines up to 60 H. P. for heavier work.

Phelps' Book Is Yours For The Asking

Every Buggy Sold on 30 Days' FREE Trial
Absolutely Guaranteed for 2 Full Years

H. C. Phelps, *President*

It Shows You How to Save $25.00 to $40.00

Don't doubt this! Send for this book *and prove* it to yourself! Do that today! It costs you nothing. 200,000 men know *by experience* that this is *so!* They saved at least $25.00 to $40.00 on every buggy they bought *after* they got *Phelps' book.* And they got the best buggies made—just as you will. Buggies made of the finest Second-Growth Hickory—*split*, not sawed. Phelps makes the famous—

SPLIT HICKORY BUGGY

Think of getting a fine buggy—*better* than others your friends pay $25.00 to $40.00 more for. A buggy that will make you the envy of all your fellows. Think of getting it to try out on the road free for 30 days and guaranteed for 2 years! Write for this book today.

And Phelps offers you the choice of an immense number of 1914 buggy styles to choose from. More than 40 local carriage shops "rolled into one" could ever show you. Address,

H. C. Phelps, *President*, The Ohio Carriage Mfg. Co., Station 290, Columbus, Ohio

MUSHROOMS IN THE HOUSE CELLAR.

Largely a "Gold Brick" Job.

I am thinking of growing mushrooms for profit, and would like to know if you think the advice A. P. Fegert gives is good to follow? RICHMOND.

The article referred to is one of those newspaper yarns which are spun in the daily papers from time to time. Here is a sample:

Home-grown mushrooms in any amount may be sold in the Manhattan market for from 55 cents to $1 a pound, according to A. P. Fegert, who says he cleared $1,000 on his own crops from September to April.

MISLEADING ADVICE.— Quite often we observe statements in various papers and magazines regarding mushroom growing, and always, as in the case of A. P. Fegert, large financial returns are obtained, and the impression given to the uninitiated that all that is necessary is to go and pluck the crop and sell it at a high figure, the same as you can occasionally gather mushrooms from an old pasture on a dewy morning. In the clipping under present consideration the statement is made that all that can be grown can be disposed of at 55 cents to $1.00 per pound. During the past few seasons growers on different occasions have not received a cent for large shipments, and it is rare indeed that 50 cents per pound is obtained, the average running 20 to 30 cents. Now it is possible under the most favorable conditions to grow one pound per square foot of bed surface, but the general average is very much lower than this. It would be safe to figure from nothing to one-half pound per foot of bed surface, as it is much easier to obtain no mushrooms at all than a profitable crop, though the chances for success are better now than five or six years ago. At that time, or a few years previous, a method of making spawn direct from the tissue of the mushroom was discovered, and by that method it was possible to select and perpetuate any variety that showed superior merits, as to size, color, prolificness and any other desirable features.

IMPROVED SPAWN.—Previous to this discovery spawn was almost entirely produced in England and mushrooms of all shapes, sizes, and colors, came from a single planting. The American process consisted of taking portions of a selected mushroom and placing them in a sterilized medium suitable to the germination of the spores in tubes. In a short time the mycelium permeated the material, which was used to inoculate bricks composed of horse manure, soil, etc. After inoculation the bricks of manure were allowed sufficient time for the spawn to run and give them a white mouldy appearance, when the growth was arrested and brick dried out ready for shipment. This spawn produced remarkable crops, and in a short time the producers were swamped with orders, and cast about for means to fill them, and incidentally their pockets also. Each season our crops became smaller and prices of mushrooms mounted higher, till one September we reached $1.25 per pound from a New York commission house, for the few obtained from a large area. Investigation proved that the spawn manufacturers instead of using the material from the tubes to inoculate each brick conceived the idea of making up a large pile of their material for brick and inoculating the pile, thereby getting quantity at low cost of production. At present I understand they have gone back to the original method and results are more certain, which accounts for the low prices prevailing the past few seasons.

PERSONAL EXPERIENCE.—We have not grown mushrooms for several years, as we found the work too unpleasant and the chances for success too precarious. We have grown them under greenhouse benches, in special houses, and in our dwelling house cellar. The latter place is satisfactory if so located that the temperature can be maintained near 55 deg. without any drying heat, but imagine making a manure storage pit of your house cellar! I do not think it will appeal to many as a desirable proposition. To grow mushrooms successfully it is necessary to have fresh horse manure containing a good proportion of short litter. This should be

"EVERYBODY WORKS BUT FATHER!" MAKING THE FAMILY GARDEN. FIG. 298.

piled and tramped solid to a depth of three to four feet and three to five inches of good loam spread over top of pile. At end of one week or sooner in hot weather the manure must be forked round, watered well, tramped solid and another covering of soil applied.

PREPARATION OF BED.—It is necessary to turn the manure four or five times and usually beneficial to add one-fifth to one-quarter in bulk of loam during the composting. Water must usually be added in considerable quantity, but at end of composting the material dare not be saturated as failure is almost certain. A fair guide is to squeeze a portion of it hard, and if moisture can be squeezed out but not in sufficient quantity to drop off the hand it is in pretty fair condition. Should the work be done outdoors and a heavy rain occur a day or two before time to make up beds the loss may be com-

plete, so it is best to be equipped to do this work under cover. The material should be put in the beds 10 inches deep and compacted as firmly as possible. Insert good thermometers in different portions of the beds and watch them closely. The temperature may go over 100 deg. and should be allowed to decline to 80 deg. before spawning.

SPAWNING.—If American pure culture spawn is used cut the brick into 10 or 12 pieces and insert a piece about 10 inches apart each way, making a hole so spawn is covered nearly two inches. Press manure down immediately, and follow up with a spade or some implement to firm the surface of the bed thoroughly. The cellar should be kept moist without applying any water to the surface of the bed, and when, upon examination you find small white threads running out into manure from the pieces of spawn inserted the beds are ready for casing. Good old sod is best for this purpose, and should be well broken up and screened, but not too fine. The application should be 1½ to two inches deep and well firmed down soon as applied. The soil should be as moist as is possible to handle easily, so that water need not be applied before mushrooms appear. The time of casing is usually two weeks after spawning.

CARE OF BED.—If beds become dry during bearing water must be applied, care being exercised to make only heavy enough to wet casing without going into manure underneath. When mushrooms are pulled the skins should be removed and all holes in surface of bed filled up with soil before water is applied. It is a good practice to have water about 90 deg. when applying to beds. That is an outline of what is required to have a fair degree of success with this crop, and our experience has been that you may have a good crop one season, and as near as possible the following season we duplicated or endeavored to duplicate conditions and treatment and met with a flat failure, that being one of the causes of our going out of the business. Another was the very unpleasant nature of the work, as all our men objected very strongly to it. I stated above that we tried it in our house cellar. For a week or more the house smelled like a stable, and certainly was an unpleasant place to live in, though after the beds were cased over there was no odor from them. By balancing work, and expense, and uncertainty, with a possible return of one cent or less to 25 cents per foot, you can easily see it is not a get-rich-quick scheme, but a hard work and uncertain proposition that any amateur should hesitate to go into extensively without some practical experience. E. J. WEAVER.

Lancaster Co., Pa.

POISON IVY.

These are the days when the city vacationist hies himself to the shady hillside or to the vine-embowered stream for his annual outing, and happy is he if he escapes the thousand and one dangers that beset the path of the unwary visitor innocent of country ways and places, so that he may return safe and whole to his routine duties.

But it is not my purpose to speak of angry bulls and hornets' nests, nor of quagmires and quicksands, but merely to bring to notice some of the various forms of that most dreaded of all common plants, Rhus toxicodendron of the botanist, otherwise known as "poison ivy." For several years I had wandered freely through the fields and woods of New York, Wisconsin, Kansas, Nebraska and Illinois without ever seeing any great amount of poison ivy—scarcely enough to become familiar with it—but not until I came to live in Southern Rhode Island did I ever see it in all its luxuriance, or come to realize how multifold are the places and manner of its growth. More and more the wonder to me is that so many people luckily escape, for in this section of New England it abounds everywhere. The automobilist passing along country roads may reach out his hand and grasp it; the callow youth may take his best girl and a picnic lunch, and seeking a fine shady nook, unsuspectingly plant himself in the midst of it; a group of romping children looking for wild flowers may plunge into it, and even the initiated when out berrying, tramping, hunting or fishing may unwittingly come in contact with it. On the other hand, it requires no technical scientific knowledge nor any great amount of skill to learn to identify it and to become familiar with its more usual habits of growth.

Everyone who has seen very much poison ivy, or even read about it, would probably recognize it readily in one of its most characteristic forms on a fence or stone heap, or even a brush pile. In the case of the stone wall, the ivy roots find soil and moisture and protection underneath the wall, while the growth above ground is comparatively free from the injurious plow or mowing machine, and rises luxuriantly into air and sunlight upon this substantial structure. In fact, so securely does the plant establish itself underneath and between the stones that it is exceedingly difficult even with the hottest fire completely to get rid of it.

Another favorite mode of growth is shown in Fig. 299, where as a climbing vine it secures both protection and an abundance of sunlight by climbing the trunk of a tree. Where the trunk is devoid of branches the ivy is readily discovered, but it often happens that the trunk is covered with its own branches, in which case the ivy becomes so intermingled with these that only a close observer is

HOW POISON IVY CLIMBS A TREE. Fig. 299.

likely to detect its presence. But even those quite familiar with the commoner modes of growth of poison ivy are hardly prepared to recognize the peculiar form of development it takes sometimes, as in Fig. 300. Here the entire mass of foliage of what at first glance appears to be an ordinary tree is made up of poison ivy leaves, the tree itself being dead and merely furnishing the physical support for the luxuriant growth of ivy that has taken possession of it. In this instance the main stem of the ivy is as thick through as one's wrist, and is securely fastened to the trunk by characteristic masses of fibrous roots. Such a growth is peculiarly dangerous; since it is so unusual and unexpected. The unexpected, however, happens frequently in the case of poison ivy. Within a rod of this tree-like form is a fine growth of huckleberries. For an hour at a time I have stood knee-deep in poison ivy while I picked quarts of the most luscious black huckleberries that I ever saw. In this case scarcely a leaf of the ivy was visible above the huckleberry bushes, but underneath was a veritable tangle of it. In a somewhat tantalizing manner, the finest blackberries and huckleberries are often closely intermingled with it. One who is somewhat discriminating, however, soon learns to distinguish it from other vines, and the peculiar form, color, texture and arrangement of the leaves become so impressed upon one's mind that he learns to distinguish it almost instantly; even children learn to know it at once and to avoid it, as I can vouch for in the case of my little eight-year-old daughter, who goes about with

AN IVY COVERED TREE. Fig. 300.

me freely through fields and woods and seldom fails to recognize it as soon as anyone else does.

The vines most commonly mistaken for it in many localities are, in part, the following: Virgin's bower, Virginia creeper, trailing blackberry, bittersweet and the like, any of which may frequently be found growing side by side with it, and often intermingled with it. While the virgin's bower has its leaves in groups of three, like the ivy, its white blossoms are larger and much more conspicuous, and its peculiar hairy clusters of seeds in late Summer are a sure means of discrimination. I knew of a farmer who, on one occasion, left his haying, and shouting at frequent intervals drove his team across lots at breakneck speed because his wife was picking what he had supposed was poison ivy, when as a matter of fact, it was only virgin's bower, and perfectly harmless, as was shown in the sequel. In another instance, a certain corner of the farm was scrupulously avoided, and children and hired men were carefully cautioned against touching any of the leaves, but the groups of five leaves rather than three might indicate, even to the novice, that this plant was Virginia creeper. The blackberry theoretically is on the plan of five, but the trailing variety, which somewhat resembles the ivy, frequently has only three leaflets in a cluster; but the veining and texture of the leaf are different, and this vine may further be distinguished by the prickers and by the edible fruit. The bittersweet may be readily distinguished later in the season by its bright yellow and red berries. The ivy, on the other hand, during Fall and Winter has rather close clusters of dun-colored berries.

Many magazine and newspaper articles give recipes telling what to use to counteract ivy poisoning, all good enough in their way, but a more sensible way is for everyone to study the plant carefully enough throughout the entire cycle of its development through the successive seasons of the year so as to be able readily to recognize it in any of its forms. Great care should be taken especially with children to teach its dangers and the various characteristics by which it may be identified, and by way of supplementing this work, village and town officers might well take upon themselves the task of exterminating it within village limits or of erecting signboards for the benefit of unsuspecting children and the unwary public generally.

Rhode Island. HERMAN CHURCHILL.

R. N.-Y.—It must be remembered that poison ivy is not always a climber, but sometimes grows erect. Patches of young plants often show a mass of erect stems from one to two feet high. The leaves are quite like those of the box elder; sometimes the margin is toothed, sometimes almost entire. The color is bright, rather light green, surface smooth. The fringe of aerial rootlets along the stem, which enable it to cling to its support, are very characteristic.

EXPERIENCE WITH AN EXPRESS COMPANY

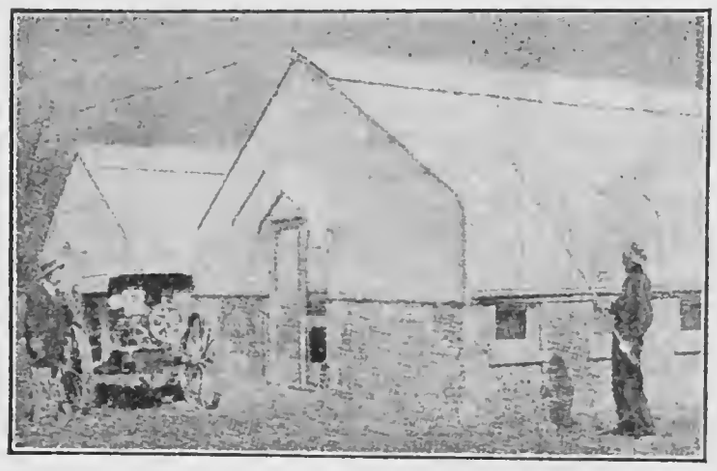
It must be a source of great satisfaction to you to look back upon the work you accomplished in behalf of the parcel post. After the experience I have had with express companies I feel like sending you a periodical letter of thanks for all that you have done. The expression used by a member of Congress at Washington recently that express companies are "parasites" appealed to me strongly. I have recently had my attention called to the following experience with one of them: To insure the arrival of personal effects at or before her arrival a woman sent her trunk before her departure to this town through an express company. It never arrived, but was shipped by error to New York although the address was plainly given and the receipt in her possession correctly states the destination. After much telegraphing and telephoning on the part of the owner the trunk was eventually returned to its starting point, but for this the *express company collected a further* charge in addition to the prepayment on the original shipment. The owner was put to great inconvenience, to expense for telegrams and telephone messages, and for necessary renovation of dresses injured by remaining packed for a long period. This occurred last midsummer. Demand has been made for the damage and a full explanation was sent. After some weeks the company claimed the letter of details could not be found; another was sent. Since then many letters have been sent on behalf of the claimant, but the matter is not adjusted. The company finally wrote the matter was in charge of its Boston office; then in charge of its New York office, and the last message stated that its Philadelphia office would attend to it. I was told by an ex-agent of an express company that it was the deliberate policy of his employer to delay adjustments until the claimant was worn out. It is this sort of attitude that has disgusted the public with corporations, and is resulting in legislation that is doubtless in many cases too drastic. I hope the day will come when every express company will be compelled to treat the public from which it obtains its substance in the same courteous and fair-minded way that is customary in the majority of modern business transactions. The parcel post appears to be our only hope in the transportation of small parcels. Everyone should write to his Congressman and Senator to uphold the extension of the parcel post. We are deeply indebted to THE R. N.-Y. for its magnificent service in this matter. SANBORN G. TENNEY.

Massachusetts.

WHEN you come to this dog question it would be interesting to see what the women folks have to say about it.

DISCUSSION OF A CABBAGE CROP.

I am 15 years of age. My father had a considerable portion of our acreage turned under last Fall, and I propose to put under cultivation half an acre in Danish Ballhead cabbage to the end that I may learn something as well as make some money. Will you tell me whether I should start with seed or young plants? Our land is a clay loam, turned under last Fall, having been in sod for a good many years. How much seed will it require? How many plants can I figure on?



SPRAYING WHITEWASH ON CONSERVATORY. FIG. 301.

What fertilizer should I use? What time should I plant the seed or sets, and could you state about the probable cost from planting to harvest, my time figured at 7½ cents an hour? We have a cultivator I could use to do the seeding and cultivation with and would you dare venture a guess as to the profits I might expect, all things considered? C. E. D.

Erie Co., N. Y.

Both cabbage and potatoes are subject to a wide variation in yield and cash returns to the acre, owing to season conditions affecting growth and final development, as well as the fact that there is no holding over of a crop. Then again, in a year of favorable conditions and large acreage, resulting in a heavy yield, the price is apt to be discouragingly low. When, on the other hand, the acreage, weather conditions, etc., are about normal there is big profit in the cabbage crop. Taking it on an average for 10 years there is good money in cabbage.

SOIL AND PREPARATION.—A well-drained, well-fertilized clay loam is ideal ground for cabbage. If it be Fall plowed without manure it is well to apply fine manure in the Spring and thoroughly disk it in. If plowed in the Spring this should be done early, plowing under a good coat of manure, for cabbage is a rank feeder. Cabbage ground wants frequent and thorough cultivation right up to time for setting the plants. Just before planting an application of 500 pounds of 5-8-10 fertilizer will prove very beneficial to the crop.

SEED.—The best and purest seed possible should be secured, as there is so often a mixture in this, and it is disappointing at harvest time to find a percentage of all-season or domestic cabbage scattered through the crop. The true Danish Ballhead is a medium size, sometimes a little elongated, and very solid, with a little rise or button on the top in the center of the head. The heads will average from three to six pounds each.

QUANTITY OF SEED.—One pound of good seed, if conditions are right, will furnish plants for four acres, but it is better to sow more than this as an insurance. The seed is usually sown with a seed drill in rows 12 to 16 inches apart, and not too crowded in the rows. This will allow the plants to be more stocky and have shorter stems. They should be kept clean of weeds and well cultivated; May 15 is about the average date for sowing the seed.

TIME AND MANNER OF PLANTING.—The time of planting in this latitude is around the last week in June. A great many are set later than this date, but chances are not as good with late planting. The cabbage planter is generally used in fields of any extent, as the machine drops a quality of water just as the plant is stuck and the work goes on rapidly. About three to four acres can be planted in this way, in a day. It requires a driver, two men or boys to stick plants and two to get the plants ready and in convenient shape for the stickers. If a small area, say an acre, is to be planted it can be done cheaper by hand setting, especially if the rows are short. The longer the rows the better the machine works, as there is less turning. In field culture the rows are usually three feet apart, while the plants in the row are from 15 to 18 inches apart. This allows for from 7,000 to 10,000 plants to the acre. The outside leaves always droop down and often dry up after setting, but if the little center leaves look green and lively the plant is all right and will come on sooner than if replaced by another plant.

CULTIVATION.—This is one of the most important steps in profitable cabbage raising. The cultivation should be started as soon as planting is finished, not even waiting for the plants to stand up. This leaves a level fine mulch, and obliterates all evidence of tramping and packing of the surface that occurred during the planting. *Then keep the cultivator going* at least once a week, until the plants are well heading. The twisting and turning of the plants by the cultivator when they get large only seems to give the roots a better hold on the soil. The cabbage crop needs a great deal of moisture to enable the plants to absorb the needed fertility, which has been developed and applied, and the frequent cultivation conserves and retains the moisture to this end. Level and shallow culture is advisable with this crop. Danish cabbage is usually harvested after November 1st, although when the earlier heads show a lighter color which indicates ripening and danger of cracking open, they are cut out and stored or marketed, or loosened in the ground, leaving only a few roots holding, which stops the pumping up of moisture and will often prevent bursting of the heads.

THE YIELD AND PRICE.—The yield runs from eight to 25 tons to the acre, as extremes, 15 tons to the acre being a good average. In the price per ton there is also a wide range—from $3 to $50 a ton. There is big money in cabbage at $10 to $15 per ton when the yield is good. There is great loss by shrinkage in storing cabbage, and it is an expensive crop to rehandle, so, if possible, it is best in the majority of cases to market direct from the field. However, if it is determined to store, a good out of doors storage is made by setting up two posts with a

PROTECTING CHERRIES FROM BIRDS. FIG. 302.

ridge pole from one to the other of these posts. Rails on poles set up on either side meet at the ridge making a long A-shaped storage in which the cabbage is piled carefully, allowing good ventilation at the ends, for cabbage must be kept cool—close to freezing—and even a little frost will do no harm, as it does in potatoes. The outside of this storage is covered with straw and then coarse manure, as needed, according to the severity of the weather. In such a storage cabbage can be taken out at any time without exposure to freezing winds.

INSECT ENEMIES.—Often the small black flea proves troublesome in the case of the young plants, when they are just starting from the seed. Bulletins on sprays of different sorts and for different purposes can be secured from the State Experiment Station at Geneva by sending in a request. Some seasons, the cabbage louse or woolly aphis is very destructive to the growing crop. If these affected plants are discovered in time the lice can be wiped off by using a cloth and whale oil soap emulsion, but if they are too far gone the plant should be removed from the field and destroyed. Spraying the crop for this trouble seems to have little effect.

It is not customary to plant cabbage on the same ground the second year, as this practice often induces what is known as stump rot. The average cost of an acre of cabbage is around $50 to $60. This cost can be greatly reduced where a large acreage is grown, the machine planter and riding two row cultivator being used; but in the case of a small acreage where these advantages are not to be had, $50 to $60 per acre is the average cost, this estimate being based on my own experience and what information I have come in touch with outside. A good crop of cabbage, when the market is right, ought to net the grower from $100 to $400 per acre.

H. E. C.

"BUILDING UP" POOR SOIL.

I have read the inquiry of H. N., on page 587, and while I cannot answer the questions he asks, I feel impelled to assure him the cow route to soil fertility is not as bad as he thinks. My problem is much like his, back-to-the-lander on a run-down farm, and I chose the cow route. I could not afford purebreds, especially to practice on, as I was fresh from the city, but there are some scrub cows which can pay their way. By finding one of these, and raising a heifer calf or two from purebred bulls each year, I now have six head, and these with my team give me considerable manure for a 25-acre fruit farm, besides paying a modest profit on the side. We make butter, and feed the skim-milk to calves and pigs.

I have been at it three years, and am beginning to see some results here and there from my tile and manure, and I am satisfied. If Nature were restoring fertility to H. N.'s farm or mine, successive crops of weeds would finally be followed by scrub trees, and in the course of a century or so the land might reach a fair state of fertility. While it is possible to hasten the process somewhat, building up run-down land strikes me as pretty gradual business, at best. Manure is popularly regarded here as the best means for this purpose. Buffalo manure (horse manure with shavings) costs $28 per carload ,and is generally used one carload to the acre, by those not having stock manure of their own. Another method of upbuilding soil fertility often resorted to is sowing oats and Timothy and clover seed with a 2-8-10 fertilizer, and then broadcasting about 400 pounds of raw ground bone per acre. This becomes available too late to help the oats, and gives a heavy stand of hay, with a good sod to plow under. Rye is generally used as a cover crop.

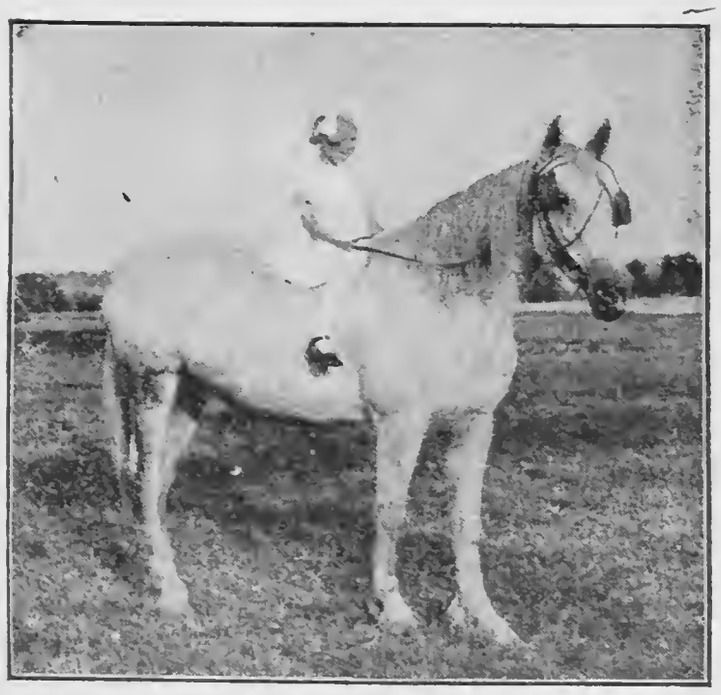
A. M.

Erie Co., N. Y.

R. N.-Y.—Our own soil, originally hard and sour, has been doubled in productive power without the use of any manure. Such manure as we do make is put on the fields near the buildings. The rest of the farm has been built up by plowing under crops of rye, vetch, Crimson clover and turnips with lime each year.

THE LOCAL STORE QUESTION.

On page 618 is a discussion of the catalogue house plan of building. Suppose you have $100, and it will take it all to buy from your local merchant. His prices, some at least, look high. By examining the catalogue sent in response to your postal card for prices you find that the goods will cost $75, and freight one or two dollars, say $5, so as to allow plenty. You have your goods and $20 in your pocket to use in your own business. If you bought from the local dealer he would have had $20 to $25 in his pocket, and in either case the bulk of the $100 would go to the city dealer and the carrying company. I see no reason why the country merchant cannot sell as cheaply as anyone else. The better class of catalogue houses advertise "satisfaction guaranteed; if for any reason or no reason our goods are not satisfactory you may return them and we will repay your money and the freight both ways." The fact that they are making fortunes while dealing on these terms shows that their prices



THE FARM CAVALRY. FIG. 303.

are not too low. The local dealer has an advantage in that you see and examine the goods before buying, and you can buy in smaller lots than you would if sending away for goods, also you can often barter produce instead of cash. The fact is the buyer needs to prosper as well as the seller for any satisfactory sort of prosperity. What we need is an equitable division of the results of our efforts. B.

Illinois.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

The Robin and the Cherry.

Fruit eating birds consider the wayward cherry tree their special property. As soon as the fruit shows color, business begins, and the householder is fortunate if he gets a quart of thoroughly ripened cherries from a fair sized tree. The man in the picture, Fig. 302, has an effective remedy, though somewhat troublesome to apply. In Europe this practice of protecting fruit trees with netting is quite common, garden supply concerns selling nets of various sizes, in some cases quite large trees being covered.

Rye Questions.

Do you think it is better to mow the rye for feeding or plow it down when I can buy the bedding at $4 per load? I also have a piece of new land which I plowed and disked about a dozen times. I would like to put this to cow peas about June, then plow down in August then sow to rye. Do you think it will grow? H. L.

New Jersey.

We should save the cash by cutting as much rye as was needed for bedding and plowing under the balance. It will all go back to the land. Save the cash. The cow peas will make a fair growth and will help produce a good crop of rye.

What is "Frenching" of Corn?

You excite my curiosity. On page 620 an inquiry is made about "frenching" corn, apparently some disease. The term cannot be found in my dictionary. What is it? D. R.

Payson, Ill.

I have never seen any real explanation of the tronble in corn and tobacco plants, which farmers call "frenching." In either case the plants in the early growth stop, and become completely stunted. The leaves of corn get striped with white, and the plants never get over 10 inches high. Similar conditions are shown by tobacco plants. In some sections the term frenching is applied to the leaf-curl in the peach, Exoasens deformans, the cause of which is well known. Frenching in corn generally appears on spots in a field that are deficient in drainage, and where the soil is acid. Corn very seldom frenches on well-drained and fertile soil. I have never found any apparent fungus connected with frenched corn plants, but it may be there is some harmful soil bacteria which have a hand in it. I have never seen any publication from any of the stations dealing with this trouble, but I have seen hundreds of frenched plants of corn and tobacco, and it seems to be one of the mysteries of plant life which need investigation. I have had corn frenched in my garden, where the soil is light, rich and well drained, and I have seen fields in which there were sinks in the level field where water would stand a little while after a rain, and these sinks would make frenched plants all over the area. I have no record of any investigation of the trouble, and am inclined to attribute it to soil acidity more than anything else.

W. F. MASSEY.

Owls and Sparrows.

It is stated that the hooting owl, the natural enemy of the English sparrow, is now ridding Elmira, N. Y. of the sparrow. It is claimed by those who have made a study of animals that the Great owl is the natural enemy of the hare.

Syracuse, N. Y. E. B.

The owls which so far have been found to prey upon this bird are the Short-eared and Screech owl. The latter bird takes more sparrows than any other bird of prey so far as we know. It is not likely that either of these species is the owl referred to by your correspondent, as the hooting owl as the name would be appropriate to neither of them.

W. L. MCATEE.

U. S. Dept. of Agriculture.

What is "Pulp Timber?"

In a recent article I see reference to the value of the "pulp timber" on a Vermont farm. Tell us what this is and what it is worth. J. M. S.

The woods chiefly used for pulp in this section are spruce, balsam fir and poplar, but the former is used more than either of the other two, and is in more demand. Last Fall the International Paper Company were paying $9.75 per cord for spruce pulp wood delivered at the mill peeled, and $8.75 unpeeled. Poplar peeled was selling on car here in Vermont for $6.50 in smaller sizes, and $7.50 in large sizes. A. F. HAWES.

Vermont. State Forester.

Wholesomeness of Scabby Potatoes.

Are potatoes that have been infected with scab as wholesome as those not so infected? Is there any danger in using them for human food? F. H.

Galway, N. Y.

We have used such potatoes many times and find no difference in food value. Scabby potatoes are wasteful for a good share of the tuber must be pared off with the skin, but we have found no difference in quality.

Arsenate With Lime Sulphur.

May I with safety, use commercial lime-sulphur solution with arsenate of lead on my apple and peach trees to prevent the Codling-moth on apples and the curculio on my peach trees? If the above-mentioned solutions can be used together, please state at what strength. Would you advise me to spray with the arsenate of lead alone, and omit the lime-sulphur? M. C.

New York.

When spraying for the Codling-worm, we use three pounds of arsenate of lead in 50 gallons of water, adding one gallon of lime-sulphur concentrate. This combination has proved very effective in fighting the Codling-worm. The addition of the lime-sulphur makes the poison stick better to the foliage, and we think it more effective, besides helping somewhat in destroying fungus diseases of the apple foliage.

OHIO CROP REPORT.

The Ohio Agricultural Department gives the following report of conditions in that State:

Wheat, conditions compared with an average, 99 per cent.; Oats, estimated area for the harvest of 1914, 1,489,090 acres; Spring barley, area sown compared with last year, 89 per cent.; Winter barley, conditions compared with an average, 96 per cent.; Rye, conditions compared with an average, 99 per cent.; Clover, average date of seeding, March 26, acreage sown compared with last year, 99 per cent.; Fruit, prospect compared with normal yield, 88 per cent.; Berries, prospect compared with normal yield, 93 per cent.

AVERAGE PRICES.

Wheat, 93 cents per bushel; corn, 70 per bushel; barley, 65 cents per bushel; oats, 43 cents per bushel; rye, 71 cents per bushel; potatoes, 88 cents per bushel; hay, $12.77 per ton; Alfalfa, $15.16 per ton.

Prospects for a large apple crop this year; peaches almost a failure, some orchards near the lake will have half crop. Cherries full crop. Farmers are busy planting trees. Many farmers are setting out large quantities of fruit.

Barker, N. Y. P. P. L.

May 8. At the present time the prospects are very good for a normal yield of apples in this section of Chautauqua County. The peach outlook is not very promising, many growers reporting the peach buds having been destroyed by the cold last Winter. The outlook for other small fruits, such as berries, is very good, with the exception of blackberries, which have been killed in some locations. Spring is very backward and at this writing there are very few oats and early peas sown. We had another heavy rain yesterday and last night which, will further delay farm operations. S. J. C.

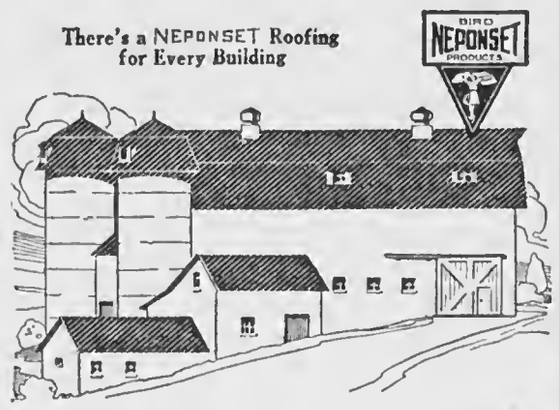
Silver Creek, N. Y.

Surely Spring has overslept this year, and is getting up way behind. Here it is May 11, and farmers just getting in oats; planting time and ground not yet ready. Something will have to hustle to catch up. Pastures look fairly well, but the meadows, when are we going cut our hay? Good spots, poor spots, and bare spots, mostly latter. Superintendent Lacey of the Dutchess Farm Bureau has been through here looking for Alfalfa. He had to use a microscope to find any, and clover is about as scarce. Fruit trees are promising well. Winter wheat nearly all killed. No Spring wheat. The cows have eaten up nearly all the fodder and are looking for grass. H. V. D. K.

Eastern Dutchess Co., N. Y.

May 5. This locality is not adapted to fruit culture, and has very little demand for garden truck. This village is a shipping point, with a population of about 500. Wheat 90; corn, shelled, 60; oats 36; hay, Timothy, per ton, $12.25; clover hay $10.25; beans, per bushel, $1.90. Potatoes are not shipped from here, but for local demand at grocery stores price is 50; wool 22. This is also a sugar beet section. Growers receive $5 per ton at factory. Beef, per cwt., $5 to $7.50; hogs $8; sheep $5; lambs $7.50; veal calves $8; milch cows $50 to $75; milk at cheese factory $1.30 per cwt.; butter at grocery 24; eggs 17. Horses, per pair, $350 to $425. O. H. R.

Ashley, Mich.



Is the roofing you buy a thing to gamble about?

Quickly made, "hurry-up," "bargain roofings" soon tell their own story of narrow-minded economy. A quick-spoiling roof which is a constant nuisance and source of expense is the answer.

Broad-minded economy will convince you that—only "slowly made" roofings are slow to wear out.

NEPONSET Roofings are the "slowly made" kind. Records of over 15 years of service—"without a single leak"—"without a cent for repairs"—prove the immense superiority of "slowly made" NEPONSET Roofings over cheaply made, inferior kinds.

NEPONSET
PAROID ROOFING

Owners of big farms specify and use NEPONSET ROOFINGS because of the remarkable "year-in-and-year-out" protection they give in hot or cold climates—at a minimum of cost.

Always buy NEPONSET Roofing and you will never get a poor roofing when you need a good one.

Surely send for ROOF BOOK—Free

"Never Saw Peas Do So Well"

This is what a user (name on request) says about his experience with

Ferguson's
NITROGEN BACTERIA

He made a close comparison, inoculating part of his peas with the bacteria, planting others near them without inoculation. Those without inoculation dried up and died; the others yielded a wonderful crop.

This is the usual experience of any one who inoculates legume seeds—peas, beans, alfalfa, clover, vetch—with Ferguson's Bacteria. Plants MUST have Nitrogen. Ferguson's Bacteria gather Nitrogen from the air and store it on the roots of the plants. They store up more than the plants can use, so that part is left to enrich the soil for future crops. The same bottle contains all the varieties of Bacteria necessary for the inoculation of any legume.

Better than the best commercial fertilizer at one-twentieth the cost

Quarter-acre quantity, 50c; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.

SPRAYING TO SAVE MATERIAL.

PERSONAL PRACTICE.—I have been interested in reading the amount of spray the "Hope Farm man" used on his trees this Spring. I notice that the amount he uses is about the same as that which is ordinarily recommended in the various agricultural publications, so it may prove interesting to some to know how a fruit grower who is undoubtedly equally particular about doing a good job of spraying is able to get over a fine, healthy orchard of 20-year-old trees (400 trees in all) with just 600 gallons of soluble oil. That is an average of only a gallon and a half of solution to a tree, yet I would be glad to see anyone who may be at all skeptical of the results look over our work. We accomplish these results by spraying in a way just opposite to that recommended at the New York Fruit Growers' Association last year. There it was said, "One ought to spray against the wind." We never do. Furthermore, while most fruit growers are very particular to insert from one to six new disks in the Friend nozzles per day, we use the old one from one to three years, all of which sounds very bad I'll admit, but it is results that always count in the end, and we are convinced that we save fully as much time by our way of spraying as we save in material. Of course, I am limiting my remarks now to the dormant spraying.

APPLIANCES USED.—When we go out to spray at this season we see that everything is all shipshape with engine and hose (we use one of the older models of the Friend outfits). Then, we give the man in the tower a short rod with a straight nozzle. The man on the ground is provided with about 50 feet of line and a longer rod on which we place an angle nozzle tilted up. Then we set the pressure gauge to read from 200 to 275 pounds pressure per square inch. That gives us a mist out of the nozzle even if the hole in the disk is an eighth of an inch across.

WINDY WEATHER DESIRED.—Now comes the strangest part of the way we spray; we want a good breeze to be blowing. The wind is what saves the spray for us. If there is a good strong east wind blowing we start in at the eastern side of the orchard and wet the first row well on the eastern side; as we turn back on the eastern side of the second row we find it very damp already, and probably the team will not have to stop before any individual tree in order for us to finish the job on the way back, and so we keep on across the orchard. Three-fourths of one day will easily cover the 400 20-year-old trees on one side, provided everything goes along well. Having done this, if the wind stays east, we work in our other orchards until it has swung around to the west. Then, we start in again and spray the rows from the west. As I said, we used just six 100-gallon tanks in this 20-year-old orchard. In an orchard in which are approximately 100 trees ranging from 30 to 40 years of age we used just two tanks in spraying both ways.

ADVANTAGES OF THE PLAN.—Our men have no occasion to get covered with spray; it is a job that we quickly get out of the way, and our results have been most satisfactory. Most of our trees are really sprayed completely about three times by this method, and yet even then, please take note that in that orchard of large healthy 20-year-old trees we used but one gallon and a half of fluid to the tree. Our method is almost as economical of lime-sulphur as of oil, we have found in the past. The man who sprays against the wind, or on a day when there is no wind at all, drives in under the branches as far as he can, takes his long unhandy 12-foot rod (a heavy thing by the time 3 p. m. approaches) and does his best to get in the middle branches; a limb four feet from his nozzle doesn't get touched, but he himself is getting covered most of the time. It will take him and the helper below at least three or four minutes to do any kind of a job on a tree of only medium size, during which time his nozzle is running a continuous stream of high-priced material, let alone the cost of his time.

RAPID AND EFFICIENT WORK.—Our nozzles are running a pretty big stream of expensive material too most of the time, but we're making very few stops. The mist from our nozzles looks like a sizable jet of steam, broken up still finer and projected with much extra force by the strong breeze behind it. It is carried horizontally straight through the trees. Spray with the same pressure on a still day and the particles of mist at once become readily distinguishable and fall straight to the ground. Just one word further (as to the ultimate results of our methods). The jobber who handled over 1,200 barrels of our Baldwins last Winter remarked that finer Baldwins could hardly be grown in this country. He has about two and a half carloads of Ben Davis in storage for us yet. Concerning these, he wrote us on the twentieth of March that he had sold 10 barrels of these (No. 1) for $5.25 per barrel, but that these were sold through the store more with the idea of getting a good look at the fruit than for the sale of moving them.

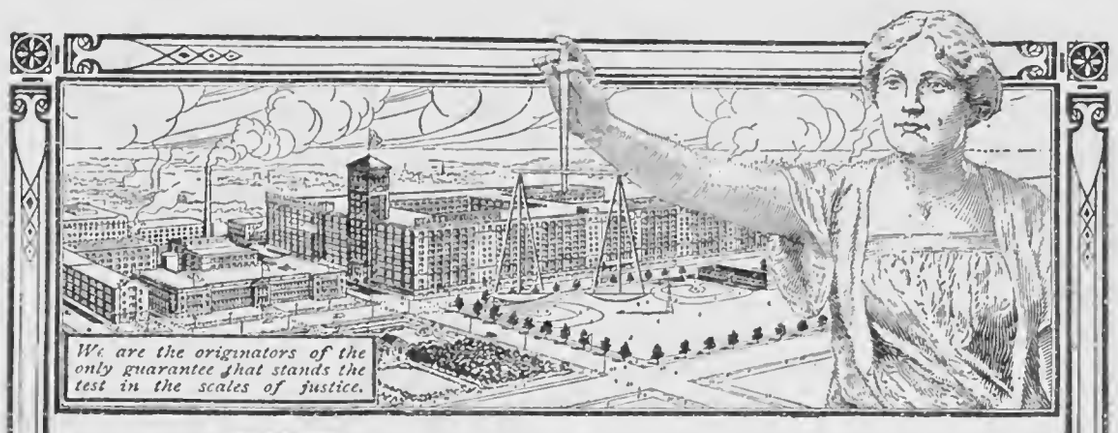
Orange Co., N. Y.

Killing Out Johnson Grass.

A good many years ago under a former management THE R. N.-Y. annually distributed small quantities of seeds to its readers. The object was to distribute promising tested varieties, and also to obtain extended trials of novelties which possessed merit in some localities, but had not been fully tried out. Under this plan some of the best varieties now under cultivation were distributed and tested. Among other things, small packages of Johnson grass were distributed. In parts of the South this grass had given most remarkable yield of forage, and it was thought that it might add greatly to the productive power of some of our lands in the Middle North and West. Unfortunately this grass proved to be a terrible pest on many farms, spreading as rapidly and as dangerously as witch grass, and causing an immense amount of trouble. In the South this grass became a terrible nuisance, although some stock men on cheap, damp land considered it a great blessing as a feed for their stock, until finally it got away from them, crawling out of their pastures into the cultivated fields of cotton and corn. Laws have been passed against propagating it, and the powers of the Department of Agriculture have been set in motion to devise schemes for killing it out. The Arizona Experiment Station has issued a pamphlet on the subject. One of the first things the Arizona Legislature did after the State was organized was to pass the Johnson Grass Law. This prohibited the transportation, commerce, or sowing of Johnson grass in any form. It also prohibited the seeding of this grass along canals, public highways, or the railroad right of way. The State recognized Johnson grass as one of its worst invaders and enemies of farming.

It is claimed that a heavy stand of this grass cuts down the value of an acre of irrigated land from $25 to $50. The worst places for the propagation of this grass are along the banks of the irrigating ditches and canals, and also along the banks of the rivers. The most practical way of getting rid of it apparently is to keep sheep confined or herded upon the infested ditch banks and on waste seedy ground. The Johnson grass propagates not only from seed, but from underground roots as well, springing up from the joints so long as the plant has any life in it. As is the case with quack grass, one practical way of cleaning it out is entirely to destroy the growth of the grass above ground. If the grass is cut off again and again it cannot, of course, make seed, which stops one method of propagation. If also the plant cannot make growth above ground the root system will die, as there must be a stem growing above ground to serve as the lungs of the plant. On land therefore that is heavily stocked with sheep, the Johnson grass will be killed out, for the sheep will nibble every spear of the grass down almost into the ground, thus preventing growth above ground, and destroying the underground roots. This same plan has been followed successfully in a number of cases in fighting quack grass, and it is more effective than the plan often used of seeding to a thick crop of buckwheat, or similar grain, so as to make a rank growth which will smother out the growth above ground.



David Bradley Little Jap CULTIVATORS

Even if we asked as much as others, the Little Jap would still be the greatest cultivator value on the market. We guarantee it to please you better than any other cultivator you can possibly buy or we will gladly refund your money.

The Bradley line includes single row and double row riding and walking cultivators of all kinds. You will find them fully described in our big General Catalog, but if you want our new Cultivator and Implement Book, which describes our complete line of Bradley cultivators, harrows, plows, planters, etc., besides buggies, wagons, harness, gasoline engines, supplies for dairymen, poultrymen, fruit growers, etc., just say "Send me Cultivator Book No. 66R64

NO other farm implement of modern times has so clearly demonstrated its superiority over all others of its kind. The patented Pivot Axle Seat Bar Lever Dodging Device can be obtained only on the Little Jap. It is the only cultivator perfectly adapted for either hillside or level ground use—among straight or crooked rows. A boy can operate it as easily as a man—weight of operator makes no difference.

The Little Jap is the easiest of all cultivators for the team to handle.

We furnish the Little Jap with all kinds of pin break and spring trip shovel gangs, surface gangs, spring tooth gangs and disc gangs. Prices from $21.25 up.

Jackson Tile Co., Inc., 89 Third Ave., Albany, N. Y.

The Picture Shows What Subsoiling Did

This corn was grown on worn out land at the Experiment Farm at Brookhaven, Miss. All of it was planted and cultivated the same way, at the same time. The ground on the left was untreated; that on the right was subsoiled—blasted and broken up four feet deep and thus restored to fertility. By using

Atlas Farm Powder
THE SAFEST EXPLOSIVE

you can double the productiveness of your fields. Under the top-soil is rich plant food that needs only to be opened up to give you bumper crops. You can do the blasting cheaply and easily with The Safest Explosive.

You can save time and money by using Atlas Farm Powder to blow out stumps and shatter boulders, dig ditches, plant orchards, and do many other kinds of farm work. It is made especially for farm use and sold at a low price.

Valuable "Better Farming" Book Sent FREE

You will find valuable information in our big illustrated book, "Better Farming," which tells how to raise bigger crops, clear waste land, and make the farm worth more money in many ways by using Atlas Farm Powder. Send the coupon and get it FREE.

EVENTS OF THE WEEK.

DOMESTIC.—John L. Billard, head of the Billard Company of New Haven, admitted to the Interstate Commerce Commission, May 7, that he made $2,700,000 profit out of a single transaction with the New Haven railroad. This is the transaction in which the New England Navigation Company, a New Haven subsidiary, sold a block of Boston and Maine stock to Billard at $125 a share and bought back the identical block a few months later at $150 a share. It is the transaction which the Interstate Commerce Commission had charged resulted in the disappearance of $2,700,000 of the New Haven railroad assets. Another transaction was disclosed in the course of the day's proceedings in which Billard sold 15,000 shares of Boston and Maine stock to another New Haven subsidiary at $154 a share, when the stock was being bought at $140 a share. Mr. Billard declined to say what this transaction netted him. Mr. Billard said he had burned all his books, papers and checks which would throw light on the dealings of the Billard Company with the New Haven railroad.

The sentences imposed upon Samuel Gompers, John Mitchell and Frank Morrison, officers of the American Federation of Labor, for violation of the injunction of the Supreme Court of the District of Columbia in the Bucks' Stove and Range proceedings, were set aside by the Supreme Court of the United States, May 11, on the ground that the alleged offences were not committed within the three years covered by the statute of limitations. This decision brings to an end seven years' litigation, which grew out of the long controversy between the Bucks' Stove and Range Company and the Federation of Labor.

Compulsory disarmament of all civilians, including deputy sheriffs, began in the Colorado strike zone, May 13, by order of President Wilson. The Colorado Peace Association, an organization of women headed by Mrs. Alma V. Lafferty, a former State legislator, is waiting for Gov. Ammons to take action on its reports against the militia's conduct in the Ludlow affair. Passage of the $1,000,000 militia bill makes possible the return to the strike zone of the State militia, and if Gov. Ammons permits the guards to go back the women plan to start recall proceedings.

Seven dead and three severely injured was the toll of the explosion of one of the boilers of the Old Dominion liner, Jefferson, May 11, five miles inside of Cape Henry, Va. The dead were all colored firemen and coal passers.

Flood from the continuous rain, May 11-12, caused a suspension of operations at the Ford Motor plant at Detroit, Mich. This means a loss in wages of $200,000. The water inundated the basement of the great power house, putting the 5,000 horse-power engine out of business and causing damage of $75,000.

The second trial of Police Lieutenant Becker for complicity in the murder of the gambler, Rosenthal, in New York, brought out damaging statements, May 12, two witnesses, Shapiro and Rose being allowed to introduce testimony that was excluded from the former trial.

FARM AND GARDEN.—Senator Johnson, of Maine, has proposed an amendment to the agricultural appropriation bill increasing the appropriation for the enforcement of the plant quarantine act from $50,000 to $150,000.

A quarantine against Maine potatoes, effective August 1, has been declared by the United States Department of Agriculture on account of the prevalence of powdery scab in that State, particularly in Aroostook County. After August 1 no common or Irish potatoes can be moved out of Maine except under regulations which the Department of Agriculture will publish shortly. Powdery scab has been prevalent for some time among Maine potatoes, but hitherto the State authorities have been responsible for preventing the spread of the disease. With the enforcement of the new quarantine, the federal government will take charge of the work. There will be, it is said, no radical change in the existing restrictions.

A large gathering of Texas florists met at Waco, May 4-5, and formed a State organization with the following officers: President, Robert C. Kerr, Houston; vice-president, W. J. Baker, Fort Worth; secretary-treasurer, George M. Cosh, Houston; press representative, L. J. Tackett, Fort Worth; educational director, E. J. Kyle, College Station.

The dates of the dog show held at the New York State Fair at Syracuse are September 3, 4 and 5. It will be under A. K. C. rules.

The rural credits bill, prepared by a sub-committee of the Banking and Currency committees of the two houses, was introduced in the Senate and House at Washington, May 12, by Senator Hollis and Representative Bulkley. It is understood that the President and the sub-committee are not agreed on the bill as presented. President Wilson is said to have desired a bill for a rural credits system operated by private capital under government supervision. The sub-committee desired a bill providing for government rural credit banks and informed the President that a "bankers' bill" could not get through Congress. A system of banks operated under a control similar to that which the government exercises over existing national banks was the most feasible plan found by the committee after hearings. The Federal Reserve Board is to have final jurisdiction over the proposed rural credit banks. The Hollis-Bulkley bill proposes the creation of farm loan associations, with a capital of not less than $10,000 each, which shall be authorized to make loans to farmers for productive purposes, not to exceed $4,000 to any borrower. All loans are to be on the amortization plan, for not less than five nor more than 30 years. The land mortgage associations may sell their mortgages, indorsed, to an amount not exceeding 20 times the capital and surplus of the respective associations, to the federal land banks created by the act. It is provided that 12 federal land banks (their locations to be determined by the Federal Reserve Board) shall be organized, each with a capital of not less than $500,000. They may issue bonds on approval of the Rerserve Board, based on the security of the mortgages which they have purchased. The rate of interest will be fixed by the Federal Reserve Board. The land bank and the local farm associations will each get one-half of 1 per cent. per annum on the total outstanding unpaid amount of the mortgages they have placed.

MEXICO.—The seizure of Lobos Island is made ground for complaint by Huerta though American officials explain that the island was not seized, but merely occupied to maintain the lighthouse for the benefit of navigation. It was stated, May 12, that Huerta has in his possession a document signed by the commander of the United States destroyer Fanning certifying that Lobos Island was seized by force. Gen. Huerta has notified the mediators that he considers the seizure of the island a violation of the armistice and it will probably be vacated. Tampico was captured, May 13, and is now occupied by the Constitutionalists. The Federal forces evacuated the city and retreated over the National Railroad of Mexico toward San Louis Potosi, where Huerta probably will make his next stand against the successful advance of the troops of Carranza and Villa toward Mexico City. The fall of Tampico was the outcome of one of the most decisive battles of the Mexican revolution. It gives the Constitutionalists an important port on the Gulf of Mexico, the first they have had; puts into their hands the most valuable oil field in all Mexico, and it opens up a source of revenue through the customs collections. It also gives them an important new base for their preparations for the march on to Mexico City. Military experts say that it will be at least six weeks before Carranza and his followers could hope to penetrate from Tampico on to the capitol of the republic. * * * Huerta has called attention to the fact that five of the snipers at Vera Cruz who have been arrested and are about to be put on trial for their lives are not Mexican subjects, but citizens of South American countries. Unfortunately three of these men are Chileans and one of them may be a Brazilian. These are two of the countries now engaged in promoting the mediation programme. The fifth sniper is a Peruvian. All five were taken from a Norwegian vessel in the harbor.

WESTERN CANADA NOW

The opportunity of securing **free homesteads of 160 acres** each, and the low priced lands of **Manitoba, Saskatchewan** and **Alberta,** will soon have passed.

Canada offers a hearty welcome to the Settler, to the man with a family looking for a home; to the farmers son, to the renter, to all who wish to live under better conditions.

Canada's grain yield in 1913 is the talk of the world. Luxuriant Grasses give cheap fodder for large herds; cost of raising and fattening for market is a trifle.

The sum realized for Beef, Butter, Milk and Cheese **will pay fifty per cent on the investment.**

Write for literature and particulars as to reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

Bee Moth; Squash Borer.

1. Do you know any remedy for worms in beehives? 2. What will prevent squash borers? J. M. F.
Ellisville, Ark.

1. The worms found in the honeycomb of unused hives or weak colonies are hatched from eggs laid by the bee moth and are best prevented from making their appearance by keeping only strong colonies of Italian or hybrid bees in the apiary and using care to store unused comb where the moths cannot get at it. A good colony of Italians or even of hybrids will protect itself from the ravages of the bee moth, while ordinary black bees, especially if the colony is weak, seem unable to keep the moths out of their hives. Strong colonies in good hives will protect themselves, and comb outside of hives may be fumigated with sulphur fumes to kill any eggs or worms present, and then stored in some moth tight place to protect them.

2. I know of no remedy for the squash borers other than that usually recommended of slitting the wilted vine lengthwise until the borer is found and then removing it and covering several joints of the vine with earth to enlarge the root system of the plant and aid in its support. This borer hatches from eggs laid upon the stem of the plant by moths and then burrows into the vine. These moths fly at twilight, and until the vines become too large, they may be protected by wire or mosquito netting stretched over the ordinary cucumber boxes usually set about such plants. M. B. D.

Handling a Muck Soil.

How should the land described below be treated and what crops are best adapted for cultivation? The land in question contains between two and three acres and consists of a muck bed about eight or 10 inches deep along the outside and a number of feet deep in the center. The top layer, which is about eight inches in thickness, is rich in humus, and the soil underneath is black and mellow. The bottom soil is clay. The land can easily be drained. This bed of muck is located in a deep gully surrounded by hills, and is well protected by woods on three sides. Into it has been washed the soil, etc., from these hills since time immemorial. J. S. R.
Buffalo, N. Y.

Every piece of land requires special study and attention in order to handle it properly. Generally speaking, however, muck lands are sour, and they require lime. They contain considerable quantities of nitrogen, but it is rarely available for plant food, until the ground has been well drained, limed and cultivated. Muck soils are also deficient in phosphoric acid, and very much so in potash. The first thing to do with such a soil is to drain it, so as to take out the surplus water, and reduce the water level. Then plow or disk the ground, and put on at least one ton to the acre of air-slaked lime. Harrow it thoroughly in. We would then, to start with, plant corn and use in the hill about 400 pounds to the acre of a mixture of three parts fine ground bone, to one of muriate of potash. Give good culture, and sow rye and clover at the last cultivation. The following year this soil will be ready for practically any farm crop, if the drainage has been well done. Such soils are generally very fine hay land, and also excellent for onions, cabbage, celery, and similar truck crops.

Watermelon and Corn Questions.

1. What are the best methods, other than plugging, of telling when watermelons are fit for use? 2. Is there any way of successfully starting garden corn in pots or sods, or any way to get it early? O. B.
Villa Nova, Ontario.

1. It is quite easy to make a mistake in picking watermelons. Even an expert will sometimes get fooled. Some press on the melon with the palm of the hand, and if they hear a cracking sound inside the melon they feel sure it is ripe. This is not the best way, however, for the pressure cracks the core, or heart, and the melon does not open as nicely as before it was cracked. Personally I prefer the thumping method, and when melons ripen normally it is fairly reliable. A ripe melon will have a thick, heavy, dense or solid sound when thumped, while a green melon will sound hollow and empty. The degree of ripeness in the melon governs the degree of hollowness in the sound. Melons on dead vines sometimes have a hollow sound when thumped even when red inside. Such melons are known as "clinkers," and are very poor eating.

2. Garden corn can be started under glass in paper pots and transplanted to the field in much the same manner as tomatoes. Such a method would be all right for a garden, but because of early Southern shipments it would not pay us here to go into it in a commercial way. TRUCKER, JR.

Water Cress on the Farm.

One of the most delicious vegetables in the world is water cress, and yet with few exceptions the farmers are doing without this delicacy when they could have it freely and for nothing more than the gathering. England is full of water cress. It grows wild in the running brooklets, in the hedge ditches and along small river banks; it is on every table in season and on sale in every city, town and village, but here in our own country it is found only in the markets of the great cities. Yet we have unexampled facilities in the millions of free running springs that in many States are found in such profusion. All that is demanded for the raising of cress is a running spring of pure water. Five cents will buy a packet of seed from any seedsman. Sow seeds in the mud at the edge of the water. They germinate easily and the plants will soon fill the bed of the stream and continue to spread down its channel. If growing near the source of the spring where the waters are warm, it will be ready for use in February and March, while the garden is still bare. It is surely not exaggerating to say that it is the equal of lettuce or of celery. No vegetable is more wholesome. I have seen a few who did not fancy it at first taste, but the same may be said of celery. Do not fail to stock your spring branch with cress and enjoy at no cost but the gathering a delicious vegetable that city people pay high prices for. Here is a chance for some enterprising boy or girl to make some money. Be the first to sell water cress in your town. Give away samples of it and thus develop a line of customers. It will be all easy pleasant work, for the cutting of the cress by snipping off the stems with shears is simple work even for a child. But if you undertake to start a bed it must be protected from the poultry and live stock, for they like it so well that they would quickly eat it all up. Enclose a few yards below the spring. If the stream bed be very narrow, widen it so the water will spread over a level space at a depth of from one to three or four inches. Cress is at its best when pure spring water runs through it.
L. R. JOHNSON.
Cape Girardeau Co., Mo.

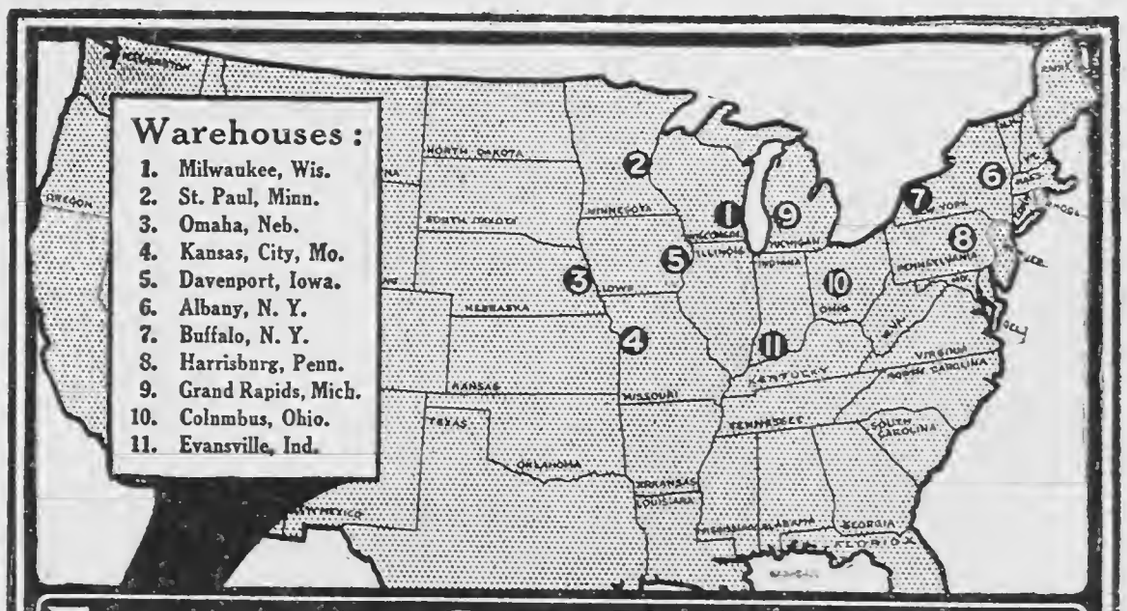
WANT TO KNOW.

Protecting The Bank of a Stream.

There is a stream running through my farm, about 40 feet in width. At one point the stream has formed an island, in the center, and in making its way around the island has caved in the bank on one side. At this point the stream is steadily eating away the bank. Can any of your readers offer a method by which I can protect this bank from further encroachment? Can you tell me the principle of the Eads jetties in use on the Mississippi, and whether the principle would be applicable to the protection of the banks of a small stream?
JOHN ALAN HAMILTON.
Erie Co., N. Y.

TRAINING A DOG.—How should I train a collie dog, and also how keep him from taking any food from strangers?
Alwent, Pa. J. M. L.

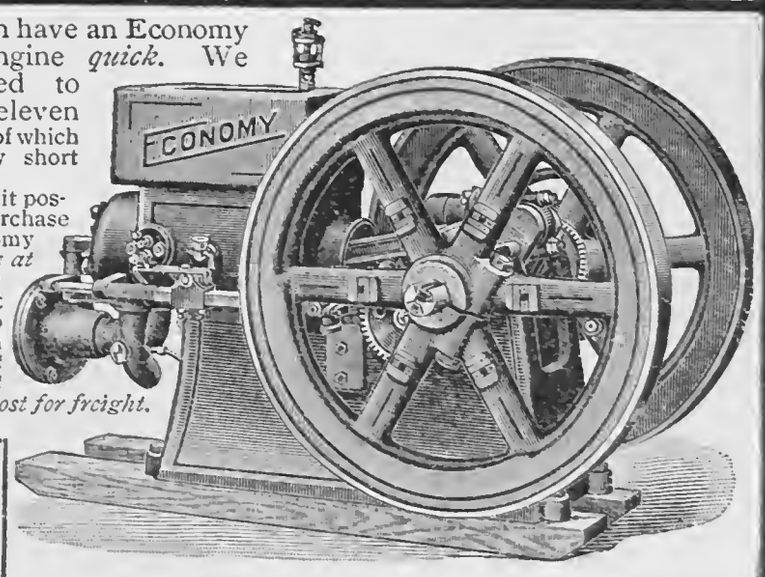
GRIMM ALFALFA.—I note on page 619 comments by F. E. Robertson on Alfalfa growing in Jefferson Co., N. Y., and illustration of the Grimm and Turkestan varieties. In Putnam Co., N. Y., last Summer I seeded two plots, identical as to previous treatment and location, one with Colorado grown seed and the other with Grimm. Today the Grimm is at least a week earlier than the other, was not injured by heaving ground, and the crowns contain more leaf shoots. Both stands would be considered good.
New York. H. W. HEALY.



Economy Gasoline Engines
Shipped From a Warehouse Near You

Now you can have an Economy Gasoline Engine *quick*. We have arranged to ship from eleven warehouses, one of which is within a very short distance of you.

We have made it possible for you to purchase *any size* Economy Engine not only *at the lowest price on record*, but you will also receive it in the *quickest time* and *at the smallest cost for freight*.



PRICES
From Any Warehouse

Horse Power	With Battery	With Magneto
1½	$ 29.95	$ 37.95
2½	39.95	49.90

Hope Farm Notes

There never was anything quite like the way the fruit bloom burst out upon us this year. I have said that season after season, yet it seems to be true. Nature does her work in the same old way; yet, perhaps, as we go along a little further this evidence of renewed youth seems to appeal to us more and more. The bloom was late this year, and we had begun to think that perhaps after all the hard Winter had weakened the buds so that only a few of the stronger ones could struggle out. Then, after a few dull, rainy days, there came one of those sharp May winds which drive the clouds and the fog off the hills, and the sun burst out bright and warm. Then it seemed that a miracle had been wrought over night. Standing on our hill we looked off over the rolling country upon a glorious picture. The grass and rye had painted the fields a deep green. There was a shimmer of lighter green on the woods. Here and there along the fence rows and in the corners the cherries were great masses of white. The plum orchard was like a white cloud, and great masses of pink had gathered where, a few days before we saw the dead brown of the peach orchards. The wind was blowing and the sun flooding all the hills with light, and the apple trees were showing the first light tinge of pink. It was a glorious picture. The man who could look off through that balmy sunshine and see the picture which the great artist had painted without being moved would be a hard citizen. I should be a little afraid of him. And probably no one can realize what it means so fully as he who has developed an orchard under hard conditions—seen the little trees grow and slowly develop until they become strong, and finally burst out into bloom to begin the real business of life. Men may gain millions or show their power in all sorts of contests with man or nature, but he who takes an abandoned field and through his own care and toil turns it into a fruitful orchard feels the supreme joy of life when Spring finally comes dancing up the valley, and puts the first bloom on his trees.

The Crop.—It looks now like the largest peach crop we ever had. Carman and Belle of Georgia are loaded full. Elberta has a fair bloom, but we have not been planting Elberta heavily. Everyone else seemed to be doing so—we think it a good plan to keep away from the crowd. At the middle of May things look right for a heavy peach yield. This condition is general through our section of Northern New Jersey. South of us there seems more damage by winter-killing, while farther north this damage is severe. I think what we may call the total crop of the Eastern States will be light, and this should be a good peach year with us. As for apples, this is supposed to be our short year, but to our surprise the bloom is heavy. The younger trees on the hill are coming on with their first fair-sized crop, but the great surprise is in an old orchard of high-headed trees near the barns. Ever since we have been here these trees have carried a great crop every other year, while in the alternate years they gave barely a peck each. Last year, for example, some of them gave 10 or 12 barrels. Thus to follow history these trees would rest this year and give us only a few big specimens. To my astonishment I find them full of bloom—loaded for as large a crop as we had last season. These trees are Nyack Pippin, Porter and Pound Sweet, and for years and years this habit of alternate bearing has been fixed. Yet here they are ready for another full crop. I can give no explanation except that two years ago we followed our plan of penning some lively shotes around these trees. The pigs were kept in portable yards and in little houses built on runners. They were kept under a tree until the sod was well torn up, and then moved on to the next tree, and so on up and down the row. They got about half their living in this way, and gave these trees a remarkable cultivation. I can think of no other reason for this year's display of buds. Looks as if they had been grafted into new life with a hog's snout!

The strawberries are in great shape—the bloom coming on thick and strong. As you know, we have had nothing but Marshall up to this year. Now we are trying three other sorts. Most of our beds are four and five years old, yet they are still profitable. I think the variety and the handling have something to do with this but it pays us, when a bed is once well started in hills, to let it stay four years at least. The five-year-old bed will be plowed after picking and put into a late crop. This may be celery or late sweet corn or cabbage. With the last named crops it will be possible to set potted strawberry plants between the rows of corn or cabbage, give all hand culture and have the soil reset in strawberries for another year. The chances now are that we shall have more berries than ever before—in fact Hope Farm never started the season more favorably.

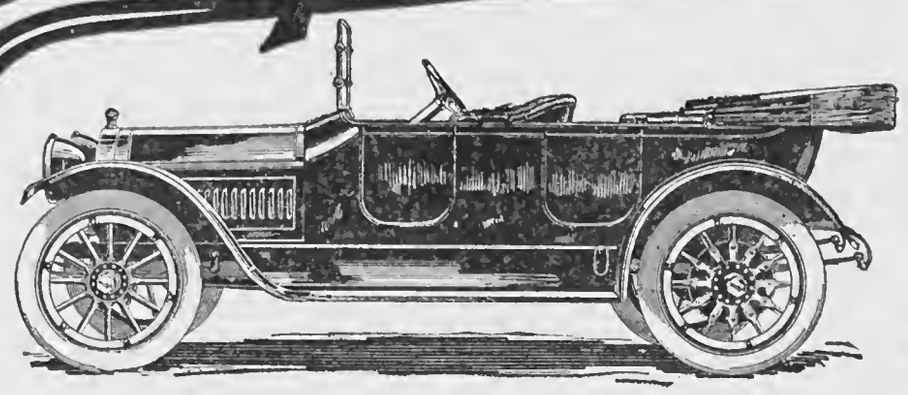
Cover Crops.—This cool wet Spring has greatly bothered the potato planters, but has been ideal for the rye and vetch. Most of the Crimson clover was killed in February, but the vetch is fair, while the rye is fine. At this season it is easy to see several special advantages of a cover crop. We have enough rye growing in our young orchards to give us at least 350 bushels of grain and 12 tons of straw if we were to let it go to maturity. That means over $500 worth of material from seed roughly covered in the corn crop last Fall. In a wet season, as this promises to be, this crop could actually be cut and taken away—the stubble plowed under in late June and fertilizer and lime used. The trees would not suffer greatly. But good orcharding is not alone a matter of keeping trees from suffering. You must keep them up to the top notch of happiness. That means in addition to spraying and pruning keeping the soil around their feet porous, clean, sweet, rich and full of humus. So we shall just cut enough of this rye to serve as bedding, and plow the rest right under as soon as it is large enough. Under it goes. You may think this is like plowing under $500 in good money—and it is. This plan, however, is not like that of the man who hid his lord's money in the earth, but it is like gaining 10 talents for the one that is given you. This cover crop packed into the soil and well limed gives opportunity to the tree, and a strong apple tree is one of the things which never will abuse an opportunity.

Wet Soils.—Another thing about cover crops, and particularly rye, is their ability to dry out a wet soil. We have several cases of it this year. Several fields at the lower farm below the spring are naturally wet. One of them, through some misplay, was not seeded in rye late last Fall. The others were. The difference in condition this Spring is remarkable. The bare field is knee deep with mud in some places and will not be workable until June. The fields where rye is growing are comparatively dry and can be plowed for fodder corn by May 15. The rank-growing rye has sucked the moisture out of this soil so rapidly that it has dried. The scientists who have measured and estimated this matter conclude that crops of grain remove from the soil while growing about 500 tons of water for each ton of dry matter in the crop. Thus you can see what a crop of this rank-growing rye does to a wet soil in Spring! There can be no question about this fact and in it lies as much of a danger on dry soils as of an advantage on wet soils. This very power of the rye plant to suck out the soil moisture may injure the soil's productive power if carried too far. Some people get a little greedy and want grain and straw and trees too. So they let oats or rye or wheat mature in a young orchard. The season turns dry and the grain crop takes about all the available moisture which the soil contains. The trees suffer and so do other crops which follow the grain.

Thus the nicest sort of judgment is required to know when to plow the cover crop under and what to do next. In a wet season like this one the crop may safely go past the bloom. In a dry season I would put it under before that. In any case, just as soon as it is plowed under, pack or crush the soil down so as to compact the cover crop solidly under ground and prevent the air from entering to dry it out. I will try to tell how we do it when we come to the job—not because we claim to know how, but to make some basis for reasoning and thinking it out.

H. W. C.

Imperial



Greatest Service at Least Cost!

We've built service into every part of Imperial cars. They are made to last a lifetime. Their operating cost and upkeep is reduced to a minimum.

We offer you the greatest motor car service at lowest cost.

Imperial

The Car That's Always in Service

The first Imperial built in 1908 is still in service. It has 100,000 miles to its credit. It's good for double that.

Nowhere for the money, can you buy greater power, comfort, style, economy of upkeep and other demanded motor car values.

All Imperials are electrically started and lighted.

Write at once for complete catalog. It's full of motor car surprises. It's proof why hundreds of farmers, all over, are buying Imperials this Spring.

Ruralisms

Failing Boxwood.

In our yard we have some boxwood which is perhaps about a hundred years old. It appears to be dying. Will you give me some information in regard to it? We would like to preserve it. Could it be transplanted? G. E. M.

Sheepshead Bay, N. Y.

No particulars are given as to the condition here involved, or the situation of the bush. Box prefers a rather moist but well-drained soil (that is, one free from standing water) and partial shade. While it is hardy as far north as Massachusetts, unfavorable weather conditions may cause killing back in this latitude; for example, late growth, that does not become fully ripened, will suffer during a severe Winter. Troubles from insects and disease are rare, but in a hot dry location red spider is sometimes very troublesome and destructive; for this spraying with whale oil soap solution is advised, early in the Spring before growth starts, or in the Fall. Red spider is also controlled by vigorous syringing of the foliage with cold water during Summer. Your shrub may have suffered from red spider, it may be Winter-killed, or, for a third cause of injury, it may be starved. The ground may be exhausted, and further depleted by adjacent trees. We should mulch with well-rotted short manure, scratching it slightly into the surface, trim off dead shoots, and keep a watch for red spider. It is not difficult to transplant box, but an old specimen needs more care than a young one.

Advice to a Nut Planter.

1. In planting a nut orchard how far apart should the trees be set, and what varieties are best to plant in western Pennsylvania or northern Ohio? In planting trees for timber how far apart should the trees be set? In planting different varieties for timber should each variety be planted by itself or is it best to plant promiscuously? J. A. C.

1. J. A. C. does not say what nut trees he wishes to plant, but I take it that he refers to the larger kinds, such as the Persian (English) walnut, pecan and Shagbark hickory. A California authority on the Persian walnut says: "With vigorous growing varieties on good soil 60 feet apart is none too much and less than 50 feet should not be considered in any case." Under such conditions interplanting with some other crop would be desirable. Peaches would be a good example. In the South they set pecan trees from 50 to 75 feet apart, according to circumstances. As no one knows how well pecan trees will grow in western Pennsylvania or northern Ohio it is impossible to say just how far apart they should be set. For the Shagbark hickory 50 or 60 feet would not be too far, but as nobody would be likely to plant an orchard of seedling shagbarks, and it would be difficult to get enough grafted or budded shagbarks of any variety, not to speak of tested varieties, to set an orchard, this question does not at present loom important. For a chestnut orchard the trees should be considerably nearer, depending on the type of chestnut. The Japanese and Chinese, and probably the new blight-immune hybrids from which we hope for so much, are small trees and could be set at 30 feet perhaps. The native American and European chestnuts are of larger build.

As to varieties these are not determined. It would be well to test out all the varieties that the nut specialists carry. The Rush, Nebo, Hall, Holden, Pomeroy and some of the French varieties grown on the Pacific Coast are among the walnuts that may be tried. For the pecan the Indiana varieties are the most promising, such as the Busseron, Indiana, Green River and others. Of the southern varieties the Stuart seems best adapted to growing north of its normal range. As for the chestnut, until we can get varieties immune to the blight, no one ought to think of planting this nut in any but an experimental and very limited way, certainly not where the native chestnut and the blight are both found.

Six or eight feet apart for nut trees for timber is recommended as about the right distance. But if J. A. C. is seriously thinking of setting any number of nut trees he should by no means depend upon the scanty advice that anyone can give to a letter of inquiry, but should study diligently the various publications on the subject, particularly the bulletins on nut culture issued by the U. S. government and the experiment stations of nut-growing States, such as California, Texas, North Carolina and others. The Northern Nut Growers' Association furnishes free on application a list of the important nut publications in the U. S.

WILLIAM CHAMPION DEMING, M. D.

Mice Gnawing Peach Trees.

I am having trouble with mice girdling my five-year-old peach trees. Is there anything that can be done? Will a coating of grafting applied to the girdled trees do any good, where they are completely girdled? They are injured under the ground. I wormed them last October, and it has been done since then, but must have been done before Winter came, as the trees have made an effort to make new bark on the bare wood. Did you ever hear of putting castor beans at butt of trees to keep away mice? I have used them in pea rows to keep out moles. I paint the trees at every worming (twice a year) with a thick lime sulphur paste 'way down in the ground, and up above and that has kept away the mice, but this time they have eaten lime-sulphur, bark and all. Is there perhaps any carbolated disinfectant powder that I could sprinkle in the hole that would keep them away from the trees? E. L. L.

Vineland, N. J.

Bridge-grafting—putting one end of scion in the wood below the wound and the other above, may save these trees. We have had no experience with the castor bean treatment. The smear of lime-sulphur usually repels vermin. Try a small quantity of Paris green or arsenate of lead in the lime-sulphur. Mechanical protectors of wire cloth or strips of veneering are surest. Tobacco dust or stems have been suggested. We are rarely troubled when a pile of coal ashes is left around the base of the tree and the snow tramped down. Charcoal or the ashes will cause the snow to melt quicker.

WAYNE COUNTY, N.Y., FRUIT NOTES.

A brief inspection trip through the orchards of Sodus and vicinity towns was recently made by Professor Herrick, entomologist of the State College of Agriculture at Ithaca. The trip was made mainly to enable a better search for the leaf-roller. Sodus and Rose orchards were inspected, but no insects of this variety were found. The pear tree psylla was found to some extent. In some orchards it was found that the under sides of the limbs were not being reached with the spray. The spray was usually found in solution of 25 gallons of lime and sulphur to 200 gallons of water. Mr. Herrick advised the additon of 50 pounds of lime and more thorough work under the limbs. No eggs of the pink aphis were found. The professor has recently found the moth that is parent to the green fruit worm, which eats holes in apples and pears. He is quite certain that fruit growers will be able to control this insect through spraying with arsenate of lead just before the bloom.

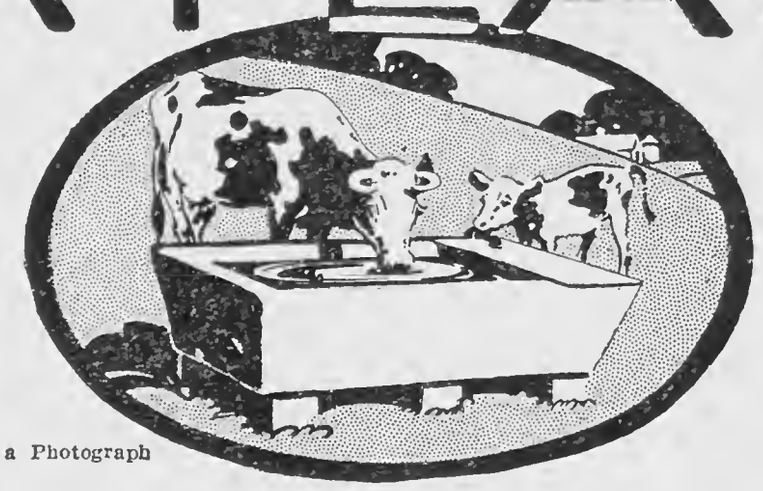
Many eggs of the tent caterpillar were found on peach trees and it looks as though an outbreak of this pest might occur unless the matter is taken in time. Spraying with a light solution of arsenate of lead will prevent the damage that might occur from neglecting to spray, but this should be done early in order to avoid damage to the foliage. Mr. Herrick has promised to come to Sodus again in a few weeks, when arrangements will be made for several fruit growers to accompany him to various orchards for the purpose of studying insects. Northern Wayne growers desiring to engage in the visit to the orchards should notify B. J. Case of Sodus.

Prof. D. P. Witter of the State Bureau of Farmers' Institutes, acting jointly with the State Department of Agriculture and the Northern Central Railway, will be in Northern Wayne one day each month this Summer. His services are free to fruit growers and farmers who may desire advice and inspection of their orchards. As this county is without a farm bureau the special services of trained experts are highly appreciated by the growers.

It begins to look as though the lake section of Wayne County is not to be counted entirely out on peach production this year. In the district immediately facing the lake there are reports coming in of some prospects for a crop after all. The Sodus Fruit Farm, which has a large acreage devoted to peaches, will make a fairly good showing. W. T. Sergeant, also in the lake district, reports prospects as fair. The inland growers, except here and there in a sheltered position, will have one of the smallest yields in years. Arrangements have been completed at East Williamson for the construction of a pickle factory. An acreage sufficient to maintain a large factory was easily secured. Over 100 acres were pledged in one day. A. H. P.

Sodus, N. Y.

ATLAS



Drawn from a Photograph

Fine for cow and calf in the hot summer days—an Atlas Cement concrete water trough is well worth the few dollars it costs to build.

More and more of your neighbors will keep a few bags of "Atlas" handy to make little practical improvements like this as they can spare the time.

Why not ask your dealer for Atlas and bring back a few extra bags in the wagon next trip?

PORTLAND ATLAS CEMENT

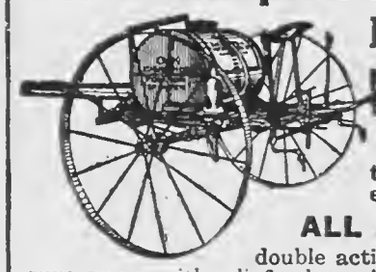
The New GREENWOOD LIME and FERTILIZER DISTRIBUTER

TOP FEED—NO RUSTING—NO CLOGGING

Accurate indicator for 100 to 3,500 lbs. per acre, whether material be wet, dry, sticky, lumpy, heavy or light. Write for booklet R to

GREENWOOD MFG. CO., Lawrence, Mass.

O. K. Champion Sprayer



INSURE the potatoes and other vegetables, also fruit and trees from disease and pests.

ALL BRASS double acting high pressure pump with relief valve. Absolute satisfaction Write today for our DESCRIPTIVE LITERATURE, ETC. FREE describing Sprayers, Planters, Diggers, etc.

Champion Potato Machinery Co., 151 Chicago Avenue, Hammond, Indiana.

The Acre-an-Hour Sifter

beats every hand implement for killing Potato, Melon Bugs, Cabbage Worms, etc. Applies Plaster, Lime, etc., mixed with Paris Green or Arsenate of Lead. Regulates to cover big or little plants, also to apply any quantity of any kind of manufactured dry insecticides. Will operate as fast as desired. Better, easier and faster than any $5, $10 or $15 spray pump. Insist on your dealer showing you this wonderful little implement. Prepaid, 75c. Agents wanted. Circulars.

ACRE-AN-HOUR SIFTER CO., Dept. B, Poughkeepsie, N. Y.

LIME SOWER—FOR SPREADING LIME, COMMERCIAL FERTILIZERS, ETC. GUARANTEED.

FOUR SIZES. DELIVERED PRICES (We ship lime from 100 Mills.)

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

In order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

Now gentlemen, let's organize a compaign to get people to stop calling cattle, sheep, swine or poultry thoroughbreds, and to stop the absurd spelling of chix and dnx. The word "Thoroughbred" refers to a distinct breed of horses—racing animals. It would be just as sensible to call a cow a Berkshire or a Wyandotte as to call her a thoroughbred. If she is eligible to registry she is *purebred*, which is the right name for her. As for that fool spelling, there is no excuse for it whatever.

*

COMMISSIONER Calvin J. Huson of New York has issued a proclamation against the tent caterpiller:

Now, therefore, by virtue of the authority conferred upon me by sections 304 and 305 of the Agricultural Law, I do hereby declare that tent caterpillars are a nuisance and a menace to the horticultural interests of the State and that all owners or persons in possession of any land or premises on which there are trees or plants infested by tent caterpillars are hereby required and commanded to destroy the nests or webs, including caterpillars, on their premises on or before June 1, 1914.

No question about the nuisance and menace part of it. In our part of New Jersey the wild cherry trees are alive with this pest, with tents at nearly every crotch. On Long Island the insect may be found everywhere. There will be fearful damage to trees and fruit if these insects are not destroyed. Every wild cherry tree should be cut out and burned as thoroughly as poison ivy. Talk about the tented enemy—these caterpillers are worse than any Mexicans on either side of the quarrel.

*

THE new tariff has now been in operation for six months, and the import and export figures are available. There should be at least one full crop year under this tariff before we may fairly draw definite conclusions. Thus far the result has been an increase in imports of manufactured goods, a decrease in imports of articles which go into American goods and a decrease in exports of American manufacturers. This indicates heavier imports of manufactured goods for the future and to that extent increased competition for American manufacturers. As to the effect of these imports upon retail prices for such goods it is too early yet to give any exact figures. Broadly speaking there has been little change. We doubt if retail prices fall, though the goods will probably be of a little higher quality. One economic fallacy has been exploded. We were told that the remedy for the high cost of living lay in wiping off the tariff on food products. The argument was that if meat, for example, were admitted free, there would be such heavy imports that prices must fall. During the six months since the new tariff went into effect 83,000,000 pounds of beef have been imported. This is about 12 ounces for each unit of our population, or two ounces per month. We must remember too that Canada rushed her surplus stock over the line at once. We doubt if even this two ounces of meat will be equalled in the future since all over the world the meat supply is short. THE R. N.-Y. predicted just this outcome, for the prices of food and particularly of meat are not determined by any tariff, but by the conditions which are controlled by the monopolies which buy, handle and carry our food. Make it possible for the owners of medium-sized farms in the Eastern States to raise and sell meat animals at a fair profit and the meat question will be provided for. To make this possible there must be a change in the buying and distribution of meat. In former years when local butchers were also slaughterers there was some profit in raising beef on these farms, because there was some competition among local buyers. There are two ways of helping this situation. One is through coöperative associations for slaughtering and selling local grown stock. The other is through Federal slaughter houses where stock can be slaughtered and sold under government supervision. It will be one of these things or enforced vegetarianism for the next generation.

*

"ABSOLUTELY FALSE."

That is what Tom Barron cables in reply to the suggestion that his Wyandottes at the egg-laying contest are hybrid or cross-bred birds. Thus far there is no evidence to prove that these laying wonders are mongrels except the statement that they would be scaled very low at a poultry show as "standard" Wyandottes. The fanciers will have to do better than that if they expect practical poultry men to take them seriously. We are simply coming to the point which we predicted when these egg-laying contests started. Now all can understand why the fancy breeders and the poultry papers sneered at these contests and refused to report them. For these contests put up fact against fancy, success against shape, eggs against extravagant claims, figures against feathers. The old "black tongue and switch" of the Jersey cow had to get out before the scales and Babcock tester. Cows did not give milk and butter with their tongue or tail, and practical men forced the breeders to give them a utility type of dairy cow. The same thing is working out for the hen through these egg-laying contests. It has come to a head through these Tom Barron birds. They may not score 75 points by the "standard," but they make the "ideal" birds look like English sparrows on the nest—which is a better tester for performance than the exhibition coop. We invite the fanciers to come forward with the evidence to show that these hens in question are hybrids or cross-breds, or better yet, to come out with 10 "standard" hens that can equal their record. Come gentlemen—it's up to you!

*

THE "BUMPER" CROP OF WHEAT.

THE reports generally agree that the wheat crop promises at this time to be a "bumper" or record breaker. A dozen things may interfere to cloud this prospect, but today the prospect is good for the largest crop of wheat this country has ever known. It is amusing to see how the great daily papers rush into double-leaded italics to tell the world about this. The farmer, tramping his dusty way behind harrow and drill last Fall did not look like a hero to these city financiers. Last Winter, as he looked with anxious eye across his lonely fields he received little sympathy. He gets little of either credit or sympathy now, though the great financial interests intend to mount the product of his labor in order to reach their fingers into prosperity and good times. The big wheat crop will mean rich tolls for the railroads, good business for the banks in providing money to move the crops, good trade for manufacturers of everything that touches the wheat, and hope for the bread eaters, who think that a surplus of wheat will mean cheaper flour and thus a lower cost of living. They all see prosperity in sight as the result of this great wheat crop, but none of them seems to include the farmer, who has made all this great prosperity possible in the coming good times. On their own records the railroads, the bankers, the business men and the manufacturers have failed to bring "prosperity." They all had to wait until the plain man behind the team on the lonely farm got his chance from Nature and thus made the big crop possible. All, every one of them, is on the run to get a share of what the farmer produces. They will take and take until out of every bushel of wheat which the farmer produces they will leave him about 12 quarts with which to pay his expenses and get ready for another crop. The remaining 20 quarts will go to the handlers who pass on the wheat until it is handed to the consumer as flour or bread. Now, since the last "bumper crop" in this country our people have learned a few things, and now we can put a few of them to the test. We have claimed that in case of a bumper crop the railroads, the handlers and the dealers will be paid just as much per bushel as when the crop was short. We have also claimed that in case of such a crop the farmer, unlike these handlers, will receive a smaller price per bushel, so that in the total the part of the money for this crop remaining on the farms will be no more or even less than when there were fewer bushels at a higher figure. Another claim is that with this bumper crop the price of bread and of flour is not materially reduced to the consumer, while the price of feed does not drop in proportion to the drop in the price of grain! In other words our claim has been that under our present system of distribution of the crop and the consumer's dollar a big crop means a large gain to those who never produced it, and no particular advantage to the farmers who did all the work and who would stand all the loss in case of failure. Now this coming big wheat crop will give us all a chance to test these claims. We welcome the opportunity of showing what becomes of this big crop.

*

MR. Weaver's article on mushroom growing is about the most sensible statement of the subject that we have seen. This mushroom proposition is a wonderful magnet for the city man's money. It seems so easy to push mushroom spawn into a pile of compost and then wait until it grows into dollars! Mr. Weaver had several crops that seemed just like finding money, but when he cut out mushrooms he was about $2,500 behind. When this happens to an experienced grower what chance will an amateur have with mushrooms? Not quite as much as the young mouse who went out to fight the kitten and found the old cat.

*

Is it true that a law has been passed, going into effect July 1, 1914, holding a farmer responsible for all injuries to his hired man, whether it was through farmer's neglect or not? For instance, if the hired man working in woods, cut his foot, and crippled it, would his employer be held responsible? Could a contract that would be legal be made releasing the farmer from all obligations? B. W. P.

We have explained this several times but the New York law seems to have been confused with that of New Jersey and Connecticut. In those States farmers are liable for injuries to hired men. In New York the law states directly that the liability "*shall not include farm laborers or domestic servants.*" Thus farmers are exempt and cannot be held legally responsible for such injuries.

*

THERE will soon be great stories about mummy or cave wheat offered at high figures. Usually the story is that a few kernels of grain were found in a mummy. When planted these grains made a wonderful growth—developing new qualities during their 1,000 year's sleep. They are now offered for sale at say 10 cents a kernel! In truth the actual life of wheat is short. There are no authentic records that mummy wheat has ever been known to sprout. It is a good story to sprout in mummified brains, but that is all. Prof. C. F. Wheeler has given us some records of wheat testing:

In 1844 wheat three years old gave 163 germinable grains out of 300 sown. The same wheat tested in 1849, after eight years; none germinated. The same wheat tested in 1850, after nine years; none germinated. Another sample of wheat tested in 1844, three years old, gave 139 germinable grains out of 300. Another sample tested when it was three years old gave 140 germinable grains out of 300.

If this season, you hear the old story of "mummy wheat" set it down as a fake at once. We think two years is the limit for safely keeping any wheat for seed.

BREVITIES.

EVERY day should be "rooster day." Make him into pie!

No—do not trust to the lime-sulphur spray for killing tent caterpillars.

SOD culture for the pigs. Give them a chance at an old sod and see their roots grow.

CURE the oats and pea hay about as you would clover—in the swath and cock. It does better cured in the shade.

THE water-glass hen is as important just now as any prize winner. Get the infertile eggs into water glass now!

YOU might not think it, but the business of packing shrimps in this country amounts to $1,000,000 per year. Most of this work is done along the Gulf of Mexico.

"FATHER finds his tall step-ladder more useful since he fixed the legs on eye-bolts at the side of the top, so the legs would swing either forward or back," says E.

THE latest proposition is a bird census for the Department of Agriculture. The object is to find out how many pairs of birds nest within a given area. Voluntary bird observers are wanted by the department.

THE highest ambition of a farmer should be to make his farm "a garden spot." The way to start this is to start a fine fruit and vegetable garden. That saves health and meat bills and also shows what you can do with soil when you try.

THE South Dakota Experiment Station claims to have a variety of sugar beet which is one-quarter sugar. This variety was produced by testing hundreds of beets and discarding all except the sweetest. Seed was obtained from the best and beets from this seed were in turn tested. The result is a variety actually carrying 25 per cent. of sugar.

ORGANIZING THE LAND BANK.

Representatives of the Savings and Loan Associations of the State of New York met at the Banking Department in Albany on May 8, to outline plans for the organization of the Land Bank. An organization committee was appointed consisting of three delegates from each Judicial District of the State, the president of the State League, the president of the Metropolitan League, the president of the New York State Agricultural Society, and a representative of the State Banking Department. The Superintendent of Banks is to prepare a suitable provision for incorporation in the by-laws of associations that propose to become members of the Land Bank. The superintendent will also notify each association in the State that it has the privilege of becoming a member of the Land Bank and of sharing in its provisions for the benefit of the members of the association.

Governor Glynn paid the members the signal distinction of attending the conference in person. His address was one of the best contributions to farm credit literature that has yet been heard on the subject. Students who were invited by the Governor during the regular session of the Legislature to instruct him on the principles of coöperative credits began to realize how completely they had been misled by the Governor's modesty, when he began to reveal his breadth of information and add entirely new chapters to the volumes that have already been written on the subject. He had the details of the systems in Europe and of the early attempts to establish a Land Bank in ante-bellum days in America as fresh in mind as his own early days on a New York State farm, where he learned the need a system to finance the farm mortgage.

"When I came to Albany and became a bank director," he said, "I found money there ready for business men in Albany, and Buffalo and New York, but none for the farmer; and I made up my mind that if I ever got into a position where I could do it, I would change these conditions. So when I became Governor, one of the first things I did was to send for the Superintendent of Banks and tell him I wanted a Land Bank, and whatever personal or political influence I have will be used for the development of this system of land mortgage credits."

Governor Glynn's enthusiasm became infectious, and the delegates went home predicting that the organization of the bank would be effected not later than the fifteenth of next September.

LAND BANK OF THE STATE OF NEW YORK

System of Mortgage Credits Explained.

PART IV.

FEATURES OF THE PLAN.—It has already been seen that this system of mortgage credits includes two features. First, the central institution, called the Land Bank, which is to gather money from outside sources through the sale of its own bonds secured by mortgages, and furnish this money to the local associations for the use of farmers and home owners. The other feature of the system is the local organization, known as the savings and loan associations. The system was built up on the savings and loan association law because these associations are purely coöperative. They are controlled and managed by the members; and the members get all the benefits. There is no profit to go to anyone else; and the administration is honest, efficient and economical. It would, of course, be possible to organize one or more large capitalized banks in the State for the purpose of loaning money on mortgages. This plan was considered and may yet be adopted supplementary to our present plan. But the cost of managing such an institution would be considerable, and naturally the capitalists who formed it would want to make the best possible profits for themselves. They would need to keep agents, and appraisers and collectors, in the field all the time, travelling from place to place, to look after the business, and the people who secured the loans would be obliged to pay this heavy expense in one way or another. It was to avoid this expense of costly administration and extra profits that the local association plan was adopted. The officers of the local association are familiar with values in the neighborhood. They also know the individuals who wish to borrow, and so know the moral risk in the loan. They are on the ground all the time to see that the rules are complied with and the property kept in proper repair. They are also there to make collection of interest and payments when due. While the association is young and small this work is done voluntarily by the members. There is no expense; and when the association grows large and strong the expense is trifling. There is no profit to go to anyone outside of the association. The members get the benefit of low rates of interest on the loan, and if there is any profit from it, he gets it back in dividends. The Land Bank enables all the mortgage creditors of the State to mass all their mortgage credits behind the Land Bank bonds, making them by State supervision an attractive investment, and the borrowers will reap the benefit of this sound and stable security without any more responsibility than he now incurs in placing a mortgage with an individual or institution. He will get his mortgage money at the rate of the Land Bank bonds plus the actual, economical expense of operating the bank. For the first time anywhere in this country the mortgages of the small homes and farms are placed on the financial basis to which their merit entitles them, and on a plane equal to that of any other industrial security in the whole country.

COST OF LOAN.—The farmer or home owner may borrow on a mortgage for 40 years or less. The rate of interest will be determined by the rate of the Land Bank bonds, and expense of administration. The borrower will make an amortization payment of one per cent. a year on a 40-year mortgage; and if interest is about 4.3 per cent. his annual payments will be $5.25 on every hundred dollars borrowed. At the end of the 40 years there will be no mortgage left. This is based on the French table of annuities. So long as the borrower pays his annual dues, the mortgage cannot be called for payment, but the borrower has the right to pay any part or all of the mortgage at any time and close the account.

PLANNING FOR ASSOCIATION.—Where local associations now exist it will be well for neighboring farmers to become members, but before doing so it may be necessary for the city and village association to change its by-laws so that payments may be made quarterly, semi-annually or possibly in some places yearly. If the old association for any reason does not wish to change its by-laws to allow longer intervals of payment then a new association may be formed in the same territory. The monthly system of payments may not be adapted to farmers in some sections. The combination of village and farm interests will undoubtedly strengthen the local associations. Where new associations are formed it will be well to interest both village and farming classes, but where this is not practical, then the association may be formed either by residents of the city or village or by farmers exclusively.

The people needing mortgage accommodations are fortunate that Governor Glynn and the Banking Department of the State are deeply interested in the subject, and are willing and anxious to do everything possible to organize and develop the system. Full instructions and blanks will be supplied by the Banking Department, and organizers and instructors will be furnished by the State Department of Agriculture. Of course men are fortunate if they do not need a mortgage. Such citizens will not be interested for themselves. No one would suggest a mortgage for an owner who does not need the money, but for those who need it and must have it, no better system has yet been devised.

SAFE INVESTMENTS.—The Land Bank bonds will be a convenient and safe investment for wage earners, farmers or any investor, large or small. They will be written in small denominations and may be bought and sold from one person to another. A person with $20 idle may buy a Land Bank bond and it will earn interest at once. When he wants the money he can sell it, or if he has more money idle he can buy another. This opportunity to invest in safe bonds ought to absorb much of the money that now goes to get-rich-quick schemes and gold-brick ventures. J. J. D.

THE FARMER OR THE PHEASANT.

In this great Empire State the law considers a pheasant of greater importance than a farmer. The law protects the pheasant and does not protect the farmer. The pheasant can pull acres of corn and the farmer must stand by and see his crop destroyed, and he must not harm so much as a pinfeather on the pheasant.

That is the way A. B. Katkamier of Ontario Co., N. Y., puts it. He gives the following correspondence:

Macedon, N. Y., April 6, 1914.

Hon. Thomas Carmody, Attorney General, Albany, N. Y.

Dear Sir:—For two years my corn fields have been badly damaged by the pheasants pulling up the seedling corn plants. This year I desire to grow a measured acre of corn, in order to get a maximum yield. I want every corn plant to grow. Will you please tell me how I can protect the corn field from the pheasants? Two years ago the seed corn was tarred, and last year considerable shelled corn was sown over the field, but neither method seemed to have any deterring effect on the corn pulling by the pheasants.

Yours very truly,

A. B. KATKAMIER.

The Attorney General referred matter to the Commissioner of Agriculture, as coming within the jurisdiction of that officer, and his reply is as follows:

Albany, April 20, 1914.

Mr. A. B. Katkamier, Macedon, N. Y.

My Dear Sir:—The Attorney General has referred to this office (Department of Agriculture) your communication addressed to him in regard to the destruction of corn plants by the pheasants. We have a somewhat similar question up in regard to the girdling of young apple trees by rabbits.

I appreciate the fact that there must be some relief found from this situation, but I confess I hardly know how it can be worked out under the law as it now stands. These rabbits and birds are protected by law, so that it is unlawful to shoot or destroy them, and there is no question but, in many localities, they are causing much damage. I am going to take this question up with the Conservation Commission and some others, and see if some plan cannot be worked out that will relieve this situation.

Sincerely yours,

CALVIN J. HUSON, Commissioner.

It will give the Commissioner extra power to "take this question up" if we all express our opinion on the subject. Here is a chance to stick a stamp for the corn crop.

New York State News.

AFTER ROAD CONTRACTORS.—The attorney-general has instituted proceedings to recover thousands of dollars from road contractors and their bondsmen for violating their contracts in road construction. It is stated that the State highway commissioner will cooperate with the attorney-general in these proceedings. Probably the first cases will be in Rockland and Suffolk counties where graft indictments have been recently found, and Warren and Montgomery counties will be next on the list. Under the highway law all contractors are bonded for 50 per cent. of the amount of their contracts and the bond is held until the roads have been accepted by the State authorities. In several of the cases it is said that the State still holds the bonds of contractors who have built roads that have not been constructed in accordance with the contracts. In Rockland County the alleged loss to the State is put at $21,417; in Warren County $15,800; in Suffolk County $38,600 and in Montgomery County $5,846.

NEW FORESTRY BUILDING.—The program of exercises upon the opening of the new forestry building at Cornell University, May 15, was elaborate and introduced to those in attendance some of the foremost forestry experts and officials. Among the prominent names were those of W. B. Greeley, Washington, D. C.; C. R. Pettis, Albany, superintendent of forests; Charles M. Dow, director of the Letchworth park and arboretum of Jamestown, N. Y.; W. H. Vary, master of the State Grange who discussed forestry on the farm; James W. Tonmey, of the Yale Forest School, New Haven, Conn.; F. L. Moore of Watertown, N. Y.; H. S. Drinker of Pennsylvania, president of the American Forestry Association; J. S. Whipple, president of the State Forestry Ass ation; Dr. L. H. Bailey of Ithaea; Gifford Pinchot, president of the National Conservation Commission.

BOVINE TUBERCULOSIS CONFERENCE.—At a conference held at the agricultural deparmtent on May 11, the question of eliminating or restricting bovine tuberculosis was discussed. It was the opinion of those present that the bovine tuberculosis law has not resulted in the elimination of this disease to the extent that had been hoped for. A resolution was adopted asking Gov. Glynn to appoint a commission to investigate the subject and report, with recommendations for legislation, to the governor before the convening of the legislature of 1915. The governor was requested to name on the commission, with such others as he deemed advisable Commissioner Huson, Dr. V. A. Moore and Hon. Seth Low. The Wheeler-Machold bill which passed the Senate but was killed in the rules committee of the Assembly, was intended to supplant the present law and it will be recommended that the new commission make it the basis of a new measure to be introduced in the next legislature.

STATE GRANGE SCHOLARSHIPS.—The time is approaching for the examination of candidates for the State Grange scholarships. These scholarships have a value of $50 each and are awarded on competitive examination based on a general knowledge of arithmetic, geography, history and English composition. The State Grange appropriates annually $600 for the 12 scholarships. Candidates must be at least 17 years of age and members of the Grange. Examinations are to be held in each county where there is an applicant on the third Saturday in June, and under the supervision of the Pomona Grange master and a committee of two chosen by him. These scholarships have been continued for several years and with growing interest. They have served to extend Grange influence and attract interest in the activities of the Grange. In many counties there are young men who have taken this short Winter course greatly to their benefit, and who have returned to the farm with a broader view of the calling of agriculture and a renewed interest in the farm.

NEW YORK APPLE GRADING LAW.—On July 1 the new apple grading law will become operative. The law provides for four classes of fruit, or rather grades of fruit. First, the New York standard fancy grade. Second, the Standard "A" grade. Third, the Standard "B" grade. Fourth, Unclassified, comprising apples not conforming to the specifications required of the preceding grades, or if conforming are not branded in accordance therewith. All closed apple packages shall bear the name of the packer or the person by whose authority the apples were packed, the correct name of the variety, the grade of the apples contained and the minimum size of the fruit. Violations of the law are punishable by a fine, for the first offense, and not more than $25 and not less than $10; for the second offense by a fine of not more than $50 and not less than $25 and for the third and each subsequent offense, by a fine not exceeding $200 and not less than $50 together, in all cases, with the costs of prosecution.

BARGE CANAL FLEET.—An important bit of news is to the effect that a barge canal fleet of 30 vessels will run betwen New York and Buffalo when the barge canal is completed. The New York and Buffalo Steamship company will soon be incorporated at Albany, with a capital of $3,500,000 to operate this line of fast freight vessels on the canal. The vessels will be driven by electricity and operated from the pilot house instead of from the engine room. Owing to the fact that there will be 380 bridges over the canal, the majority of them only about 15 feet above the level of the water, the vessels will be built low and resemble enclosed car floats. Each will be 275 feet in length and 40 feet in width and will have a capacity of 1,500 tons. The distance from New York to Buffalo via the canal is about 500 miles which will be covered by the boats in 108 hours. This time will include 35 hours for stops and 12 hours delay in the locks. The average speed of the boats will be eight miles an hour but they can make ten. These boats will cost about $6,500 each. That this canal traffic will prove a very considerable competitor to the railways when the full fleet is in operation, is shown by the advantage it will have in the point of time of transportation. It is said that it takes quick freight eight days to reach Buffalo from New York and heavy freight, such as coal, sometimes nearly three weeks. This by rail. An official of the proposed line of vessels is quoted as saying that the boats will make the trip in three days and the rates will be 20 per cent lower than rail rates. These fast boats will be known as express boats and will stop at Albany, Troy, Schenectady, Utica, Syracuse and Rochester. The other boats will stop at all of the 30 cities on the route and will make the trip in 119 hours. The boats will make no stops at any of the Hudson River cities, except Albany, and will not be operated on the lakes. J. W. D.

Woman and the Home

From Day to Day

THE BIVOUAC OF THE DEAD.

The muffled drum's sad roll has beat
The soldier's last tattoo;
No more on Life's parade shall meet
That brave and fallen few.
On Fame's eternal camping-ground
Their silent tents are spread,
And Glory guards, with solemn round,
The bivouac of the dead.

No rumor of the foe's advance
Now swells upon the wind;
No troubled thought at midnight haunts
Of loved ones left behind;
No vision of the morrow's strife
The warrior's dream alarms;
No braying horn nor screaming fife
At dawn shall call to arms.

Their shivered swords are red with rust,
Their plumed heads are bowed;
Their haughty banner, trailed in dust,
Is now their martial shroud.
And plenteous funeral tears have washed
The red stains from each brow,
And the proud forms, by battle gashed,
Are free from anguish now.

Rest on, embalmed and sainted dead!
Dear as the blood ye gave;
No impious footstep here shall tread
The herbage of your grave;
Nor shall your glory be forgot
While Fame her record keeps,
Or Honor points the hallowed spot
Where Valor proudly sleeps.

—Theodore O'Hara.

*

WITH the centralized school, rural scholars are sent to town. An idea directly opposite to this was proposed by Henry Kelley at a recent meeting of the Connecticut Nurserymen's Association, who pointed out the advantages of establishing city schools in the country. He is thus quoted by the Florists' Exchange:

If good judgment were to prevail in our cities when a new school building is necessary, instead of looking around for the most expensive lot to be found that is to benefit some one with a pull, and then building a building out of all proportions to what it should cost, it would be better to go out some distance into the rural district, on the line of a good trolley, then buy ten acres for, say one-half what we would pay in the city, and build a comfortable, sanitary, sensible school house with every improvement that can be devised; have your swimming pool, athletic field, kitchen and work shop; have the grounds laid out with a variety of trees and shrubs; have space for gardens of vegetables, plants and flowers.

*

TWENTY years ago a correspondent wrote to this department of THE R. N.-Y., telling of her experiments in wearing one-piece undergarments and one-piece dresses, and urging other women to try her plan, which she found comfortable and convenient. It must be 40 years since some courageous reformers invented one-piece combinations, which they called "chemiloons," and which most women regarded as very daring and radical experiments. Now we have all adopted these changes in costume, and have an opportunity to realize that the radicalism of one generation is very often the conservative progress of the next. Nothing will prevent silly women from wearing silly clothes, but whenever disposed to quarrel with fashion, remember that sensible women now dress far more comfortably and hygienically than they did a generation ago, and this without looking "backwoodsy" or unfashionable.

*

EACH year, when our daffodils are all in bloom, we wonder how any garden lover can be content without a generous display of these lovely flowers. We care very little for the double ones, though a few of the old-fashioned double forms of Pseudo-Narcissus give variety, but our taste is all for the single sorts, and one has a noble array at moderate cost. The trumpet sorts we grow in quantity are Emperor, Empress and Horsfieldii, which are beautiful, hardy and inexpensive, while the Welsh daffodil, Sir Watkin, is equally satisfactory. The Poet's Narcissus in its two forms, Poeticus and Poeticus Ornatus, is freely naturalized in the lawn. The double Poet's Narcissus dies out with us, apparently not hardy, and the same is true of some very fine trumpets, such as Glory of Leyden, but a number of the Barrii section do well, and are very showy. Spring bulbs are the most fascinating ornaments of the garden, and there is no limit to their possibilities.

SEEK not to be rich, but happy. The one lies in bags, the other in content, which wealth can never give.—William Penn.

The Rural Patterns.

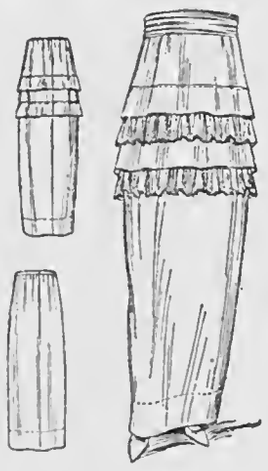
When ordering patterns always give number of patterns and measurements desired. Price of each pattern 10 cents.

8240, fancy tucked blouse, 34 to 42 bust; 8241, semi-princess dress, 34 to 42 bust. 8258, semi-princess dress for

No. 8240.

No. 8241.

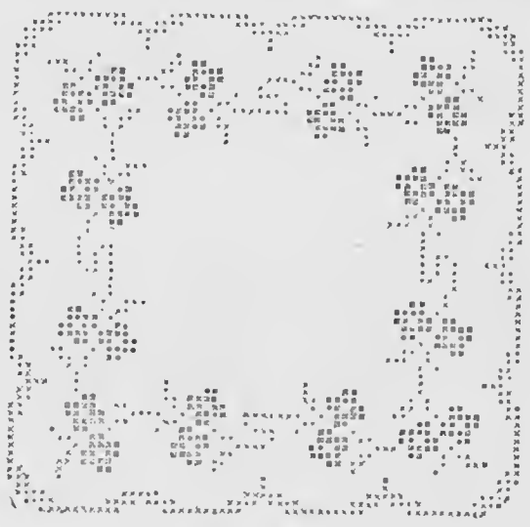
No. 8258.



No. 8239.

misses and small women, 16 and 18 years; 8239, one-piece skirt, 22 to 32 waist.

No. 754. A design for embroidering a pillow or cushion cover in cross-stitch style. In the pattern all the stitches are shown as simple crosses but in the illus-



No. 754.

tration, some are lighter, some heavier. The lighter stitches represent the border and the leaves. The heavier crosses represent flowers. Stamped on art ticking 22x22 inches, with green back and mercerized floss to work, 40 cents.

Seen in New York Shops.

A pretty hat seen in a Fifth Avenue shop was a close shape of blue straw, the crown covered with blue ribbon. At the right side the ribbon was brought over to make a perky tall bow, and the edge of the curved brim was outlined with a double row of small daisies. There was nothing startling about the hat but the price, which was $28; however, it suggests a smart style for making an inexpensive hat.

A new idea in fastening a fancy blouse is to use links made of two-inch strands of small beads, having a larger bead at either end. These pass through eyelets, and all sorts of combinations may be used.

A trimming seen on a chiffon blouse consisted of floral figures cut out of a handsome ribbon and applied on the plain material with fine buttonhole stitch. The ribbon itself was used as a girdle.

Most large shops now display a wide choice in ready-made mourning garments—hats, wraps and dresses. As a rule styles are much more sensible than they used to be. It is now considered that pure white in a plain material may be worn in the house, or during warm weather, for the deepest mourning. Materials should be plain, never embroidered, figured or cross-barred, and there should be no trimming except tucks, hemstitched ruffles and open hemming. Voile, China silk, crepe de chine, plain batiste and plain cotton crape are all suitable. When in deep mourning black girdles or trimmings are not allowable with these white dresses, but they may be worn with what is called second mourning. A new fashion permits white hats and veils for young girls' mourning, the veils being of white Brussels net edged with dull white ribbon, and these white hats are worn by older women also. Collars and cuffs of white organdie, which follow the fashionable flaring outline, are very becoming for mourning dresses and blouses, costing, made up, from 50 cents to $1.50 for the set. White crape cuffs and collars, which are also worn with the deepest mourning, are rather newer, and cost $3.50 the set. Many widows nowadays do not wear the small bonnet formerly invariable, but replace it with a small round hat with a veil of crape or net edged with crape folds hanging at the back. This is entirely correct if the brim is faced with white crape, but it is a mistake for a widow to omit the white facing from her first mourning, though this is often done. Of course a face veil of net with crape or dull ribbon edge is worn also.

Flower blocks are articles in china, glass or metal, more or less ornamental, containing holes into which the stems of heavy flowers may be inserted. The block is put into the bottom of the vase or bowl, which is filled with water as usual; then the flowers are arranged, some of the stems being inserted in the block, so that the flowers stand up in any desired position. This is a Japanese idea, and many quaint models are shown, frogs, turtles and crabs of bronze being very popular; there are also squirming fishes of white Japanese porcelain, all being heavy enough to hold the flowers; they cost from around 50 cents up to $1.50 or more. English flower blocks of clear glass are plain in shape, costing from 15 cents for a two-inch size, and up to $2.50 for the eight-inch block; these larger ones are complete vases in themselves, as the cavities for the flowers are little wells that hold water.

Making and Serving of Beverages.

Beverages are taken for their temperature—hot or cold, for their delicious flavor, or for their stimulating qualities, and sometimes for their highly nutritive value, as when milk, eggs, cocoa, or chocolate is used. All beverages should be made with the utmost care, and served daintily, if it be but a cup of tea; always using freshly boiled water for the hot ones, and freshly drawn, cooled on ice, or iced for the cold ones.

The best rule for making tea is the old-fashioned one: "One teaspoonful for each person and one for the pot." Scald the teapot, which should be either silver, aluminum, earthen, or granite, but never of tin, with boiling water, and when this is turned out put in the tea, and pour over it the fresh boiling water, and allow it to stand five minutes, then pour immediately. Some prefer a thin slice of lemon added to their cup of tea to cream or milk. Iced tea is delicious, and on a hot day as refreshing as a beverage can be. Make your tea in the usual way, then strain it and set on ice until needed. For a quicker way, pour the freshly brewed tea into glasses one-third full of finely crushed ice, and sweeten to suit the taste, and a slice of lemon or orange, or a few crushed mint leaves, may be added if one likes.

Coffee is a stimulant rather than a nutrient as many are lead to suppose, but a single cup of coffee taken at breakfast and one at dinner rarely proves harmful if properly made, and when iced it is quite as delicious as iced tea. Coffee or tea taken with either milk or sugar alone is much more healthful and less likely to cause ill effects than if both sugar and milk are used.

This is my rule for making seven cups of really delicious and healthful coffee: Scald the coffee pot in the same manner as when tea is made. Beat one-half of an egg, and crush the shell, then add one cup of coffee, two-thirds Java and one-third Mocha makes an excellent blend, and one-half cup of cold water, and stir well together. Put this into the scalded coffee pot, and pour over it seven cups of boiling water, and let boil up three times, or for five minutes, then add one-half cup of cold water, and allow it to stand twenty minutes where it will keep hot without boiling. Serve in heated cups with cream and sugar. For iced coffee simply dilute strong, plain boiled coffee with hot milk, add sugar to suit the taste, and chill. Serve in glasses with crushed ice.

Unlike tea or coffee, chocolate and cocoa have a high food value, containing both protein and fat. It is because of its high percentage of fat that chocolate is likely to cause indigestion if used to excess, or when taken in connection with a heavy meal. Cocoa, being less rich in fat, is, therefore, more easily digested, and forms a wholesome beverage for both old and young.

To make eight cups of perfectly delicious chocolate, scald one quart of milk in a double boiler. Scrape four ounces of chocolate and add one tablespoonful of sugar, put all in a small saucepan, with one-half cup of boiling water; heat over hot water, and stir until smooth and glossy, then add to the scalded milk, and beat all vigorously with a wire egg beater for a moment or two, and serve. A teaspoonful of whipped cream placed in the bottom of each cup and the hot chocolate poured over it makes it just so much more delicious. For iced chocolate, stand the hot prepared beverage aside to cool, and when cold fill glasses one-third full of crushed ice, add a little powdered sugar; then pour in the chocolate, and top with a spoonful of whipped cream. Cocoa should be made and served in the same manner as chocolate.

Beverages made with fruit juice are cooling and refreshing. Because of the acids and mineral matters they contain they furnish a wholesome and direct effect upon the system, and for this reason are especially beneficial during the hot weather. A plain lemon syrup will furnish a foundation for any number of delightful fruit combinations, and with a good supply on hand the busy housekeeper can concoct a lemon or orangeade, or a fruit punch, at almost a moments notice.

To make the syrup, mix together one pint of sugar and one quart of cold water, and when the sugar is dissolved heat gradually to the boiling point, and let boil fifteen minutes, then add two cupfuls of strained lemon juice, cool, and turn into a glass fruit jar, cover, and keep in a cool place. When needed for a plain lemonade simply dilute with ice water to suit individual tastes, and garnish with thin slices of lemon. A delightful tea punch may be made by adding three cupfuls of the lemon syrup to two quarts of well brewed tea.

For a glass of orangeade add the strained juice of one orange to two tablespoonfuls of prepared lemon syrup, and three-fourths of a cupful of plain cold or ice water. Ornament the top with a slice of the fruit, and dust with a wash of nutmeg. Another simple and delicious drink is made by adding one pint of grated pineapple to one pint of syrup, and three pints of water. Set on ice for three or four hours, then strain and serve.

Raspberry shrub is very simple to prepare. Wash and pick over two quarts of very ripe but perfectly fresh berries, place them in an earthen or porcelain bowl, and sprinkle over them one cupful of sugar, letting them stand two or three hours, then strain through a flannel jelly bag. To the juice add one pint of lemon syrup, and one quart of ice water.

You who never made a ginger lemonade should try this recipe, it is simply delicious. Cook one-half pound of Canton ginger, one and one-half cupfuls of sugar, and the grated rind of two lemons and one orange, in three pints of water for 20 minutes. Squeeze the juice from six lemons and two oranges, and add to the boiling syrup, then remove from the fire, cool, strain, and set on ice until ready to use. Dilute with ice water as desired.

Mint Punch.—Make a syrup by boiling one quart of water and one pint of sugar in the same manner as for lemon syrup. Separate a good sized bunch of fresh mint in pieces, and add to two cupfuls of boiling water, cover, and let stand five minutes, then strain into the syrup, with one pint of strawberry juice, the juice of two oranges, and six lemons, and cool. When ready to serve add ice water to suit the taste, and strain. Place a block of ice in the centre of the punch bowl, and pour the punch over it, then garnish with fresh mint leaves and whole strawberries. ROSAMOND LAMPMAN.

More Notes from Colorado.

Canon City, Colarado, is now on the map. At one time, not so many years ago, the railroad, following the banks of the Arkansas River through the plains of eastern Colorado, and on to the west along sandstone cliffs, stopped short at the mining regions near the base of the Rocky Mountains. There was no alternative—no way around or through the barrier that loomed conspicuously beyond. The river, starting from somewhere away up there, had plowed its way through a deep narrow chasm, and emerged into the valley where cactus, sagebrush, coyotes, jack rabbits and prairie dogs had full possession. From these conditions the old timers may tell you of the evolution of Canon City. Those who have come out to this beautiful, modern, mountain town in recent years see only the result.

Canon City nestles at the foot of tall, irregular peaks just at the opening of the present famous "Royal Gorge," through which, as a result of persistency and engineering skill, heavily loaded trains thunder eastward and westward to meet the demands of traffic. From the clear cut "Skyline Drive" that trails over the "hogback" 300 feet above the outskirts, you may look down on the "City Beautiful" with its broad, well-kept streets, State Penitentiary buildings, schools, churches, lodge halls, up-to-date depots, Y. M. C. A. building, public and private homes, banks and business blocks—all backed up by the best class of people with a business enterprise that keeps things moving. Canon City, however, is preeminently a city of homes. It stretches itself miles to the east in orchard tracts. To the south of the river, on a distinctive highland or shelf more areas of orchard land spread themselves over what is known as "Lincoln Park," making withal a complete setting for the picture within.

On a Summer day you may see all the roads leading into town lined with one-horse wagons piled high with crates of berries or quantities of garden stuff for shipment through the numerous fruit and vegetable associations that handle the trade for the eastern markets. Every man, woman and child is busy as occasion demands during the fruiting season, and the main rural population is seen in the open, "carrier" in hand, or "topping" boxes in the shade. Many are out here for the mountain air, and they get it on eating and sleeping porches, or in the berry patches. Retired farmers, lawyers, preachers, or teachers, it makes no difference in the Canon City districts. Then from October until Christmas the apple industry is in full swing. Canon City apples are coming to be known far and wide by their excellent flavor, due to the altitude, as well as their keeping qualities. Apple picking and packing are among the fine arts, and the scientific handling of the extensive crop is worth the best effort of all interested parties. Orchardists are making a special study of fruit growing, through horticultural societies and institutes where experiments is exchanged and information gained through experts from the State College. Frosts and insect pests have had their innings at times, though to its credit, the oldest settlers affirm that such things have been unthought of for years in succession. At any rate with rich soil and ample irrigation system a good living may be gained in the poorest of years.

Just now, everything is propitious from every viewpoint. Aside from the resources of "vine and fig tree" there is the climate, unexcelled in nature's sanitarium, sheltered on three sides from the rougher elements of wind and storm. Scenic drives lead out in every direction to attractions of pass and canyon—incentives to camping and picnics the whole year through. And then there is always the beauty of the "everlasting hills" stretching away to the distant ranges.

CLARA ABIGAIL GEBHARDT.

Why should we sweep rugs and pile carpets with the nap just because custom says so? It is this crushing down of the nap which makes a new rug into an old one, and it would seem that sweeping against the nap would assist in keeping the pile raised as it should be. Don't be slaves to custom but think for yourselves, and sweep carpets *against* the grain to preserve its freshness.

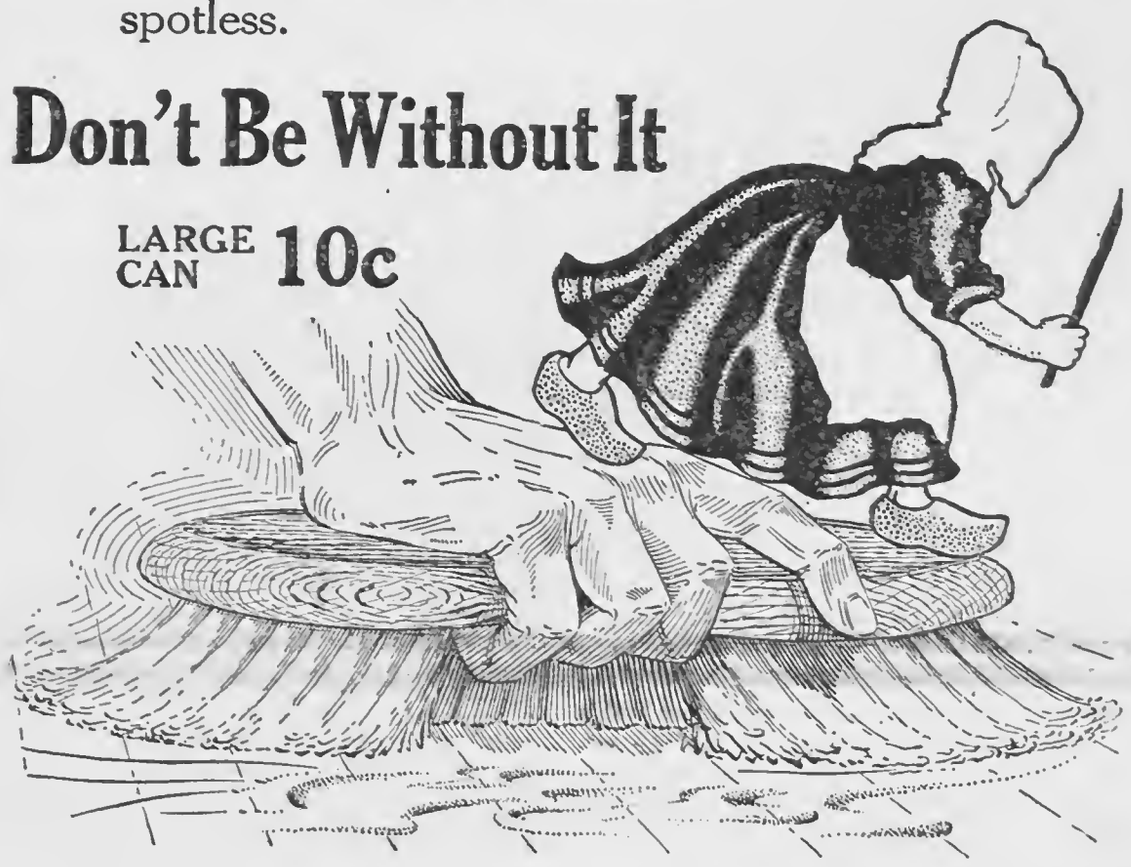
Don't Be Without It

LARGE CAN 10c



Live Stock and Dairy

BUYING A PUREBRED BULL.

It would seem to me that the average dairyman is not entirely level-headed on this question of engaging in the breeding of purebred cattle. I have a suspicion that a large percentage of these men have never been in the dairy business for themselves before, and get the idea that they should "get in right" on the start by investing in full bloods, and, by the way, you can almost always spot one of these men as soon as you hear him speak, for he will inquire if you have any "Thoroughbreds" to sell. (Just think of alluding to a big bony pot-bellied Holstein cow as a "thoroughbred.") Of course everyone who keeps a dairy should own a purebred bull, and I say "everybody" advisedly. It is poor policy to depend on some other man's bull, and it is hardly fair to the other man either. The main trouble is that it is often inconvenient to take cows away at any time, and the result is that some of our cows fail to breed and we suffer a loss much greater than the cost and maintenance of a bull of our own. In my own

A SEVEN-YEAR-OLD GUERNSEY COW.

case, the getting with calf of one valuable cow that I had been having trouble in breeding fully paid for my registered bull.

Then again, the percentage of profit on a purebred bull in use in a native or grade herd is much greater than it would be in a purebred herd. One can depend upon a grade cow, sired by a purebred bull, as being worth from $10 to $25 more than she would be if sired by a grade. So, when one considers the price at which a purebred bull calf (or an older one either) can be bought, it would seem that no one would continue to use grades. Then I would buy a registered heifer calf, if I were reasonably sure that I could raise the calf into a well-developed cow. If I did not know how to raise a calf at all, I would first experiment on grades.

In buying the calf, select a good individual. This is imperative if one would expect to get good results. Don't, under any circumstances, be fooled into buying a worthless calf just because it is trying to keep from cancellation a valuable pedigree. Always bear in mind that the value of a pedigree is problemetical. What the cow or the bull has done is largely what they have been given a *chance* to do. Smith buys a bull and places him at the head of a big herd of the best cows that money will buy. He keeps him until he is old, and keeps adding to his herd all the best cows that he can buy. The result is that Smith's bull becomes the sire of a long list of "tested" daughters, and his name is valuable in a pedigree accordingly. Brown buys a full brother to Smith's bull, and an equally good animal in every way. But Brown is a poor struggling farmer just working into a herd of purebreds. So his bull is used mostly for grades, and he sires but a few purebred daughters. The consequence is that he goes down in history as a "no account," and his name in a pedigree amounts to nothing. Still the blood of Brown's bull is just as valuable as that of Smith's excepting for the *advertising* worth of the more fortunate animal. In reality neither bull may have had much intrinsic value.

As an illustration: Suppose that Smith buys 100 cows that on an average have official tests averaging 20 pounds of butter in a week. From these cows he raises 200 heifer calves, all sired by the one bull. At maturity, if these young cows do not average better than their dams, but very little credit should be given the sire. Still a bull with 200 tested daughters would be considered a marvel. And, do you know, just this sort of thing is being done? It most certainly is. Men are pooling their money and scouring the country for the best cows they can find. These cows are brought together and bred to certain bulls. These bulls are producing a lot of good calves, and they ought to. Other men are mortgaging their farms to buy the bull calves sired by these favored lords of the barnyard. Do you suppose that they are getting the worth of their money?

A good many have the idea that if they cannot go in for one of these "boomed" animals they may just as well keep out. when the fact of the case is that $100 or $200 *judiciously* expended in the purchase of a bull would secure just as good an animal as $1,000 or $2,000 spent for an animal that *seems* to be worth that much to the uninitiated. But this is not saying that *no* bull is worth $2,000 or even much more than that.

J. GRANT MORSE.

AMERICAN JERSEY CATTLE CLUB.

Two things were given special consideration at the annual meeting of the American Jersey Cattle club last week in New York city. These were the increase in registration fees for males from $1 to $5, and the proposed reduction of fees on cattle imported from the Island of Jersey. These questions both called out much discussion. The former came up as an amendment to the by-laws, to be submitted to the membership for a mail vote, and provided for an increase as above stated "in all cases wherein record of birth has not been filed, and also in all cases wherein the animal is over two years old at the date of application." but if the date of birth, etc., has been filed then the fees to members shall be $1 and to non-members $2. The same fees were made applicable to females.

The other proposition referred to was to reduce the fees on animals imported from the island from $100 to $10 for all animals that passed the registry of merit test there, and $25 for all others. On vote the proposition did not carry. It was then decided to investigate conditions to ascertain if some test basis could be fixed for the levying of the fees on island imports.

Several others were considered and will be submitted to the membership. Among the more important of these were the following:

Permitting the change of names of animals which have not been printed in the Herd Register, provided application to make the change has been made to the secretary within a year and a fee of $5 has been paid; concerning the use of numerals in names which must be used in sequence with the dates of birth; refusing to register animals under names that are misleading, or profane; requiring that twins be registered at the same time "unless one of the twins is dead and the death has been reported to the club"; empowering the executive committee to instruct the secretary to register an animal in case of the refusal of the owner of the sire or of the breeder of an animal to sign an application for registration, etc.; requiring the seller of an animal to furnish a certificate of transfer on forms provided by the secretary without cost; permitting agricultural colleges and experiment stations to enter herds of Jersey cattle at the same rates as paid by members; provided that

KENDALL'S SPAVIN CURE

Is a safe and reliable remedy. It will cure Ringbone, Splint and other bony enlargements. It is also a reliable remedy for Curbs, Sprains, Bruises, Cuts and Lameness. It does the work safely at small expense.

Read what James M. Thompson, Fraser Mills, B. C., writes: "Would you kindly send me one of your horse books? I have a Veterinary book which I paid $5.00 for, but I believe I can get more satisfaction out of Kendall's Treatise on the Horse. I gave the book you sent me before to another barn boss."

And Mr. Wm. Booth, of Gravette, Ark., writes: "Your book is worth $5.00 if only used as an aid in locating lameness. Shoulder lameness is the most difficult for an inexperienced man to locate. It is easy, however, with the help of your book."

KENDALL'S IS HORSE INSURANCE

Kendall's Spavin Cure is sold at the uniform price of $1.00 a bottle, or 6 bottles for $5.00. If you cannot get it or our free book at your local druggist, write us.

DAIRY CATTLE

Island Breeding

is richly represented in the Meridale Herd. Our imported Jerseys have been carefully selected, with particular attention to persistent production; and the dairy worth of our Island Family has been proven through authenticated test work year after year.

It is with peculiar satisfaction that we offer a bull and three heifers from our Island Family for the use of others to whom this breeding especially appeals.

The combination is fairly representative of the Island Family of Meridale Jerseys and offers the opportunity for just the sort of line breeding which we pick to win. Particulars on request.

animals owned but not bred in Canada may be entered in the A. J. C. C. Herd Register if they were imported from the United States, the Island of Jersey or Great Britain, and animals bred, or both bred and owned in Canada, to be eligible to entry here must be the progeny of animals already entered, or being already entered in the Canadian records must trace an unbroken line of registration either to ancestry in the A. J. C. C. Herd Register or to animals entered in the Island of Jersey Herd Book; abolishing the requirement that the letters "A. J. C. C." be tattooed in the ear of each imported animal; empowering the executive committee to appoint a representative to visit any herd for the purpose of inspecting the records kept.

The more important suggested amendments to the constitution that were approved, were: Providing for the holding of special meetings of the club outside the State of New York; permitting the voting of proxies by members of the club only; requiring that an applicant for membership in the club shall be an owner of Jersey cattle, and if "five of the total votes cast (in an election to membership) are negative, the candidate shall not be admitted to membership except by the unanimous vote of the board of directors."

According to the report of President Darling, the past year has been one of the most successful in the history of the club. The revenues increased over $9,000, the registrations 3,655, the transfers 4,777. The total registrations last year were 29,381 and the total transfers 34,737. The net income the past year was $86,673.62. The expenses were $68,158.26. The complete registration is 121,000 bulls and 307,240 cows.

Officers for the ensuing year are: President, E. A. Darling of New York; vice-president, Prof. H. S. Redfield of New York; treasurer, John P. Hudson of Georgetown, N. J.; secretary R. M. Gow of New York. Directors: Geo. W. Sisson of Potsdam; John I. Bishop of Philadelphia; S. N. Warren of Spring Hill, Tenn.; G. T. Chaffee of Rutland, Vt.; L. F. Herrick of Worcester, Mass.

The annual banquet was held at the Manhattan hotel on the evening prior to the business meeting of the club, the guests of the association being Dr. W. O. Thompson, president of the Ohio State University; Dr. L. H. Bailey of Ithaca; Prof. F. C. Minkler of the New Jersey State Experiment Station; Mr. C. L. Hill, president of the Guernsey Cattle Club and Mr. W. W. Marsh of Iowa, who addressed the banqueters.

Skin Trouble.

What makes little pigs scurrify? They are six weeks old, have a dry pen, lots of sunshine and are bedded with oat straw. Do you think oat straw causes the trouble? M. F. R.

Pennsylvania.

Dusty, chaffy oat straw is about the poorest possible bedding for pigs. It also is highly dangerous on account of the dust it contains. This gets into the lungs, causes cough and in some instances fatal pneumonia. Substitute shredded corn fodder, rye or wheat straw, or hay as bedding. Wash the pigs with a 1-100 solution of coal tar dip and repeat as required. Keep the pigs out of wet and filth. A. S. A.

Partial Paralysis.

I have a sow suckling pigs; has become stiff in her hind quarters, and can hardly get one foot ahead of the other. What is the trouble? I have been feeding her on whole corn, and meal slop. We have no veterinarian in easy reach. G. W. S.

Maryland.

As often explained here, fat, flabby, pampered sows are prone to this form of paralysis, or parturient eclampsia. It is brought on by the strain and drain of nursing, and is induced by stuffing on corn and other rich feed and restricting the exercise. Wean the pigs. Turn the sow out on grass and feed slop or middlings, a little cornmeal and bran, and 10 per cent. of digester tankage. Sows will not suffer in this way if made to take exercise every day while in pig, and fed mixed, laxative rations, including Alfalfa, roots or silage and a little tankage. Keep most of the corn for fattening hogs. A. S. A.

Failing Cow.

I have a young cow six months gone with second calf. She had a bad attack of indigestion two weeks ago. I gave her two doses of Epsom salts, 1½ pound to a dose, also gave her proprietary medicine for a week, then gave her nux vomica to give her appetite. The cow is better, has no pain, but the appetite is no good; she will not eat feed of any kind. Sometimes she will nibble a little at a mash of cornmeal and bran. I am keeping her out of doors all I can. She has free access to green rye and Crimson clover, but she will only look at it, has got very poor. What do you advise?

New Jersey. G. A. J.

Uterine examination should be made as the cow may be carrying a dead calf. If so it must be removed at once. If that is not the cause of symptoms described then we should expect the presence of tuberculosis. To make sure, have the cow tested with tuberculin. Any graduate veterinarian can apply the test. A. S. A.

HORSES

HIGHLAND VIEW STOCK FARM

Our last importation of BELGIANS and PERCHERONS is the BEST we ever imported. We have sold more Stallions and Mares in the last sixty days than we ever sold in a year. WHY? Because we sell the good, big, drafty kind at the right price, and cheaper than the other fellow.

JUSTAMERE FARM, Middletown Springs, Vt.

Purebred Registered
HOLSTEIN CATTLE

In the production of milk and butter the larger the cow the larger the profit, other things being equal. This principle has been established through the investigations of government experts and is generally recognized.

When a cow's milking days are over, size is still an important factor. The big Holstein-Friesian, weighing anywhere from 1,000 to 1,800 pounds with her clean white fat well distributed through her muscular system, proves a most profitable dairy beef animal.

THE EGG-LAYING CONTEST.

The twenty-seventh week, ending Friday, May 8, shows no falling off in egg production but a slight gain. The output for the week was 3,358 which is 37 more than were laid the week before.

The remarkable laying of Tom Barron's White Wyandottes is stirring up some of the fanciers and others. Vague charges are being made, such as that "they are hybrids," "a cross with some other breed." "not true to *our* Wyandotte shape," etc. I have written to Mr. Barron of the criticisms asking him to cable me, "statement false," if it is false. Personally I have no idea that he has ever crossed them with any other breed; but if he has, I am sure it was done to improve the laying qualities of the "strain," and without the slightest thought of fraud. This subject of "pure bloods" cannot be adequately treated within the limits of this report.

A White Leghorn pen laid the highest number this week, Glenview Poultry Farm's pen laying 56. White Leghorns also take second place, pen number 39 from Storrs Station laying 55. Mrs. K. E. Woodruff's White Leghorns from New Haven laid 54, and two pens of S. C. Reds laid the same number. They are the Colonial Farm pen, and A. B. Brundage's pen. Two pens of White Leghorns laid 53. Tom Barron's White Wyandottes lead all other pens with a total score of 1,119; next to them stands the White Leghorn pen No. 42 from Storrs Station with a total of 1,015. This is the "sour milk" pen. The week's performance and the totals are given below:

GEO. A. COSGROVE.

The Figures on Baby Chicks.

In answer to the query on page 632 under "Brevities" as to the cost of baby chicks, will say that I keep an account of the cost of each hatch, and give below the cost of a couple of typical ones. The cost of eggs is figured at the price at which they are sold for hatching.

RECORD NO. 5.

120 eggs, at 5c each		$6.00
Battery and lamp		.10
Grain alcohol		.06
Carbolic acid		.005
Lamp wick		.005
Kerosene oil		.81
		$6.98
Credit 21 infertile eggs for chick feed		.21
No. of chicks hatched	63)	6.77
Each		.1075
Expense of No. 6, same as No. 5,		$6.98
Credit 7 infertile eggs for chick feed		.07
No. of chicks hatched	66)	6.91
Each		.1047

The quantity of oil used in each hatch is determined from the quantity purchased for several hatches. The time required caring for a hatch is approximately as follows:

	hr.	min.
Dipping eggs	..	15
Cooling eggs	..	..
Turning	3	30
Filling lamp	1	15
Candling	1	..
	6 hours.	
Cleaning and disinfecting	1 hour.	
	7 hours.	

In the case of Record No. 5, 63 chicks at 12c equals $7.56 or a profit of 79 cents, amounting to about 11 cents per hour for the operator's time. In the case of Record No. 6, 66 chicks at 12c equals $7.92 or $1.01 profit amounting to about 14 cents per hour. A. D. RAND.

New York.

BILL Smith, a country shopkeeper, went to town to buy goods. They were sent home before him. When the boxes arrived Mrs. Smith, who was minding the shop, uttered a scream, seized a hatchet, and began to force off the lid of the largest. "What's the matter?" asked a bystander. Pale and faint, Mrs. Smith pointed to an inscription on the lid. It read: "Bill inside."—Melbourne Australasian.

300 LICE Or More on One Hen
is by no means uncommon. No one would expect to fatten a steer with that number of "ticks" sucking his blood, but many expect the old hen to go ahead shelling out eggs while lice and mites are sapping her very life. We have counted over 2000 dead lice under a row of ten hens, on a roost board painted the night before with Lee's Lice Killer. This great killer does double duty—contact kills mites, lice, bedbugs, etc. about the roosts; the vapor kills lice on the chickens sitting over it. Put up only in airtight cans.

For sale at over 10,000 towns.
Three sizes—35 cts., 60 cts., $1.00. Poultry Book free.

CREONOID

Makes the Hen-house Sanitary

A perfectly sanitary hen-house means profitable hens! It's merely a matter of keeping the interior of the hen-house free from lice, flies, nits, etc. This is easily done with Creonoid—a coal-tar product which no vermin can stand.

Creonoid also protects your cows from being pestered by flies and increases their yield of milk.

Ask your dealer for it.

The Henyard.

Feeding Young Chicks.

A question of great interest to amateur poultrymen at this time of the year is how to feed young chicks. Here is the way they do it at the Agricultural Station at Mountain Grove, Missouri. "We sprinkle a little clover chaff, shredded Alfalfa, fine cut straw, or other clean litter free from must or mold, over the floor of the brooder before the chicks are put in it. We fill a small fountain with sour milk or buttermilk for the first half of the day, and water for the last half. If you cannot get the milk, then see that they always have plenty of pure water. We prefer sour milk to sweet milk, because much of the harmful bacteria in the intestinal tract is prevented from developing by the lactic acid of the sour milk. The acid of milk aids digestion, kills bacteria and has an appetizing effect.

"Begin by feeding a mixture of two-thirds rolled oats, one-third wheat bran, with a small amount of fine charcoal. Oatmeal is the finest food known for young animals. This is fed on a clean board four or five times a day, and the board removed after five minutes. Clean sand or fine grit is given at the same time. After two or three days we begin feeding a little commercial chick feed with the above mixture, and gradually increase this. The rolled oats and bran are fed morning, noon and night, and the chick feed thrown in the litter between meals. After the fifth day feed a dry mash made as follows: Two parts wheat bran, one part cornmeal, one part middlings, one-half part rolled oats. To every 100 pounds of this add a handful of charcoal, a handful of bone meal, and one-half pound of table salt, mixing it in thoroughly. When the chicks are five or six weeks old their ration of chick feed and rolled oats may be gradually changed to cracked corn, wheat and kaffir corn. Continue the dry mash, and the sour milk if you can get it. Get the chicks out on bare ground and in colony houses as soon as possible. Feed them from hoppers both of dry mash and grains. Let them have free range and help themselves to all the feed they want. If you want to push them rapidly feed a wet mash once a day with 10% of fine beef scrap in it."

This is the Missouri way, but I prefer the Cornell College way.

GEO. A. COSGROVE.

Poor Hatch.

I have about 200 pullets in fine condition, are laying very well, but it seems their eggs do not hatch. I had two hens coming off, one got two chicks, the other none. The eggs were all fertile and full-grown chick in every egg. What can be the trouble? I started the incubator with 350 eggs before the hens were due. They are White Orpingtons. The shell does not come off the egg when boiled.

New York. E. H.

There is evidently a lack of vigor in your flock somewhere which prevents your eggs from hatching, though fertile. This may be due to the heavy laying of the pullets through the Winter, or, possibly to an excessive number of pullets with the males in the breeding pen; or the males, themselves, may be at fault. Close confinement of the flock and heavy feeding through the Winter also tends to lack of vigorous fertility in the Spring. As the season advances, particularly after you have turned your fowls out, this condition will probably improve, and you may get a better hatch from the eggs in the incubator than from those set earlier under hens. If it can well be avoided, eggs from fowls that have been closely confined through the Winter, and fed for egg production, should not be depended upon for hatching in the Spring. They may be fertile, but are apt to contain weak germs which can never develop into vigorous chicks. M. B. D.

Loss of Young Chicks.

Do S. C. W. Leghorn day-old chicks have wing feathers that cover their bodies? I have lost 52 out of 200 and a lot more are on the same road as they are rocking backing and forth, don't want to eat, and a lot of them had feathers longer than their bodies. The seller claims that these chicks being older than day old, and being on the road for two days without anything to eat were starved so when they did start to eat couldn't stand it. F. W. M.

Connecticut.

The wing feathers of White Leghorn chicks develop rapidly but do not cover their bodies at one day old. They are well started by the beginning of the third day, however, and in a few days more are as long as the chicks' bodies; some that I have now, five days from the incubator, have wings that extend to within about three-quarters of an inch from the extreme end of the body and their tails are about one-half inch long. Your experience in losing chicks is far from uncommon, whether purchased as "day olds" or hatched on the premises. Many chicks start out in life with a lack of vitality which condemns them to a very brief existence. M. B. D.

On Farms Where Efficiency Rules

—where progressiveness marks every feature of equipment and method—you will find the buildings covered, once and forever, with

J-M ASBESTOS ROOFING

"The Roll of Honor"

A roofing of everlasting, pliable stone, made of pure Asbestos and Trinidad Lake Asphalt. A perfect protection for otherwise perishable buildings. Requires no paint or other protection. No maintenance cost. Keeps buildings cool in summer, warm in winter. Affords wonderful fire protection. Proof against every weather condition. Easy to lay with J-M Cleats, which come with each roll. White and attractive—no cement-smeared, unsightly joints or laps.

J-M REGAL ROOFING was perfected to supply a demand for a rubber type, wool felt roofing, lower in price than J-M ASBESTOS, but containing the H. W. Johns-Manville Co.'s standard of quality and service. Also applied with J-M CLEATS.

J-M ASBESTOS SHINGLES meet the demand for a decorative fire-proof residence roofing that never needs paint.

Your dealer keeps J-M Roofings, or you may order direct. Write nearest branch for Book No. 38

The Sharples Separator Co.
West Chester Pa. U.S.A.

April 8, 1914.

H. W. Johns-Manville Company,
New York City, New York.

Gentlemen:

We are using your Asbestos Roofing on our new dairy barn, having decided to adopt it because of the satisfaction it has given us on other buildings. Our barn and equipment are thoroughly modern in every way, and our dairy is run on a profit-producing basis, so that the feature of ultimate saving which can be made with your permanent roofing was an attractive one. It also gives an appearance of neatness, which is very valuable on a dairy farm like ours. We are glad to recommend it.

Yours very truly,
THE SHARPLES SEPARATOR CO.
R. L. Sharples

THE RURAL NEW-YORKER, 333 W. 30th St., New York

PUBLISHER'S DESK

Occasionally a farmer is a little careless in his correspondence. Recently we had a claim from one of them against a Brooklyn concern. We made a demand for settlement, and the remittance was promptly sent the farmer, but no reply was made to our letter. The farmer also neglected to advise us that he had received the settlement. In accordance with our custom, we continued to follow up the complaint, and it was not until some months later that we forced the information from the Brooklyn concern that the account had been adjusted. This, of course, was embarrassing for us. The experience is rare, but it does occasionally occur. If a shipper receives communication of any kind after complaint is forwarded to us, the new information should be promptly forwarded, and remittances should be promptly reported. There is no charge in any case for what we can do; but the advice will save trouble, loss of time and embarrassment to us.

I found my imaginary name on the suckers' list last Fall. In August I attended the Cambridge fair and while there, I ran across a man who gave three agricultural papers for three years and a fountain pen, all for one dollar, you see, something for nothing. I took them; about three weeks later I saw on the publisher's page of THE R. N.-Y., warning of this game, so I gave it up for lost right away, and it was lost. C. W. N.
New York.

The bargain counter is a poor place to look for service, and service is what is needed in a farm paper. The fountain pen fakers have been debarred from fairs in Ohio and Michigan; and they ought to be denied the privilege of playing their deceptive game on all New York State fair grounds.

It affords me pleasure to inform you that my recent claim of $6.60 against the Adams Express Company for a damaged case of eggs, has been paid and I hereby thank you for the valuable service you thus rendered me. If at any time I can give you any assistance at this end it will be a pleasure to do so.
Maryland. J. B. W.

I have at last received package from Adams Express Company—one year from time of shipment. I paid them the $3.50 which they said was transportation expenses. The goods were all right but badly mussed up. I am extremely grateful to you for all your kindness and trouble in the matter. I shall lose no opportunity to speak a good word for you, and as the Irishman said, "May your powers never grow less." W. M.
Rhode Island.

Kindly pardon my tardiness in informing you of my settlement with the Adams Express Company in regard to dead chicks, amount $12.24. Records of carelessness were complete but they withheld payment. I want to express my sincere thanks for your earnest efforts and I feel the matter was cleared up through your kindness. C. M. V.
Rhode Island.

I received check of $6.20 from Adams Express Company, which is my full claim against them. I thank you very much for entering my claim. F. A. S.
New York.

I received payment of $9.60 for the eggs sent Mr. Mapes which became so oily while in possession of Adams Express Company that he could not use them. I thank you for your work and will pay you whatever is right for same.
New York. H. J. T.

Received check for $12.60 from Adams Express Company to cover my egg shipment of August 2, which contained cracked, broken and stained eggs to that amount. Please accept my thanks.
Pennsylvania. W. J. K.

I received check for $7.20 in settlement of my claim against Adams Express Company for the box of meat lost in transit. Send me your charges and I will settle. Thank you kindly for your help. M. S.
Ohio.

The above letters affecting one express company shows the necessity of some system in the shipment and marketing of farm food products. We could fill columns of such reports every week. The first step in the saving of these losses, is to assemble the goods at the shipping stations, and ship in car lots to men in the markets representing the shippers. The essential to this system is coöperative organizations of shippers.

I was interested in your account of Geo. F. Cole in THE R. N.-Y. Perhaps you will be interested to see how slickly he fooled us. He offered two or three cents better prices for eggs than I was getting, at Faneuil Hall market, but if he did not pay for any of his goods, he could afford to offer a good price.
Massachusetts. C. H. G.

For 25 years now I have been warning country shippers against this trick of irresponsible commission men. It would seem that the shipper ought to catch on after a while. The commission man who offers prices above the market, is reasonably sure to leave you his creditor in the end. At different times we thought it impossible that Cole could ever get shipments again except for cash in advance, but each time he bobs up with a haul from a new section. Put a pin in him now.

You seem to have tried to collect many bad bills for your readers, and I am going to ask your kind offices in an effort to get the enclosed bill for $18.60 for me from Jos. Ash, Sweet Clover Farms Dairy, 643 Lexington Ave., New York. This covers eggs sent to Mr. Ash in 1912.
New York. J. E. O.

There are things beyond us, and the collection of this claim is one of them. Our attorneys fell down on the job as well as ourselves. If these city concerns cannot show a satisfactory rating, it is better to have cash before the goods are shipped. Where you are a member of a coöperative company the manager of your company will have a rating before he ships eggs to a customer. He may sell them through the State Market Commission, and in either case you will be $18.60 ahead and probably more owing to better price.

Edwin K. Hanley of Binghamton, general manager of the National Development Company, who was last week found guilty of having used the United States mails for fraudulent purposes, also appeared before Judge George W. Ray yesterday, but the passing of sentence was deferred because Hanley has agreed to pay back about $2,000 to persons who put money into the Development Company. "I commit you to jail until May 26," judge Ray told the prisoner, "in order that you may have an opportunity to make restitution, but this does not involve any promise whatever on the part of the court."—Local Paper.

We are glad to see a tendency on the part of courts to encourage crooks to make restitution to the poor people who have become victims of their schemes.

I saw an advertisement of the Cluthe Co., 125 East 23rd Street, New York City, in which they offer to send a Cluthe truss on 60 days' trial without the purchaser having to risk a single cent. I sent $12 and got, to me, a worthless and crude appliance. I returned it twice and each time they sent it back and refused to return my money as originally promised. F. F. H.
Ohio.

When we read the advertisement we got the idea that it stated clearly that the purchaser was entitled to 60 days' trial, and that if the test did not prove the value of the truss then it was to be returned and the purchase price would be refunded. We wrote the company and got a reply from Chas. Cluthe & Sons, Bloomfield, N. J., who seem to be the proprietors. They say that they do not give such a broad guarantee as we understood. In their letter to us they ignore the terms of the advertisement, and say they accept orders only as per the booklet, as per guarantee, and as per order blank. This order blank specified to guarantee to fulfill all claims made for it in book entitled "Cluthe's Advice to the Ruptured." The order blank also says this is the "only device for rupture that is sent on 60 days' trial and guaranteed to hold successfully; it is the most comfortable holder ever invented."

It would seem from the correspondence that the advertisement implied plainly enough that the purchaser was to have an unconditional trial of 60 days without risk of a cent; but that the order blank modified this condition so that the truss was guaranteed only to the extent specified in the book. Our notion is that the layman like ourselves would get his idea from the advertisement, and would not bother to decipher the technical terms of the booklet or of the order blank. The plan of salesmanship has evidently been carefully worked out. There is little question that an astute mind has worked out all the details to make it technically legal; but our correspondent who accepted the advertisement in good faith is out his $12. If our laws do sanction such a transaction is our application of law and justice all that it should be? J. J. D.

CRAINE SILO IT CAN'T COLLAPSE

The Craine Patent Triple Wall Silo has thick vertical wooden staves, inside; horizontal patent wooden covering thoroughly nailed, outside; and water-proof felt-like rubber roofing between. This makes a perfect non-conductor of heat. SCIENTIFIC in every feature of its construction.

IT'S FROST-PROOF
AIR-TIGHT PERMANENT

No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

Knife Grinders
Binder Twine

A DAIRY farmer who does not use a cream separator is losing up to $15 per cow per year. Complete your dairy equipment by the purchase of an International Harvester cream separator—Lily, Bluebell or Dairymaid. These separators skim closely—leaving barely a drop of cream in a gallon of milk—and they will do it for years.

These machines are furnished with pulleys for the use of power. Belted to a small I H C engine, you have the best outfit it is possible for you to buy. Note the low supply can on I H C separators, the height of the milk spout which allows a 10-gallon can to be used for the skim milk, the strong frame with open base which can be kept perfectly clean, and the dozen other features which make these I H C machines the best.

Your local dealer should have one of these machines on sale. If he has not, write us before you buy and we will tell you where you can see one; also send you an interesting book on separators.

Products, Prices and Trade.

PRODUCE RECEIPTS AT NEW YORK.

Week ending May 14.

Butter, lbs.	3,065,160
Eggs, doz.	5,533,530
Apples, bushels	55,300
Potatoes, bushels	103,700
Hay, tons	7,552
Wheat, bushels	962,560
Corn, bushels	34,350
Oats, bushels	408,000

Wholesale Prices at New York, Week Ending May 15, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.50	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Last year the following preminms over contract prices were paid high-scoring dairies: April, May and June, seven cents per 100 pounds; July, eight; August, 10; September and October, 11; November, five.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 5¼ to 5½ cents per quart. Two or three large milk concerns in New York are working up new restaurant trade on the basis of $1.85 per 40-quart can.

BUTTER.

The usual defects in changing from barn feed to pasture are very noticeable in this week's receipts—a mixture of flavor which many consumers do not like. Buyers are taking only enough for current needs until this hay-to-grass condition is over. This naturally makes the market unsettled and tending toward lower prices.

Creamery, extra, lb	26 @	26½
Good to Choice	22 @	24
Lower Grades	19 @	21
Storage	17 @	22
State Dairy, best	25 @	26
Common to Good	18 @	22
Factory	14 @	18
Packing Stock	15 @	17

Elgin, Ill., butter market 26 cents.
Philadelphia, western creamery, 26 cents.

CHEESE.

The market is weak and a good many cuts in price are noted—one-fourth cent regularly, and more if necessary to move stock.

Whole Milk, new, best	13 @	14
Old, best.	17½@	18½
Common to good	12 @	15

EGGS.

Receipts are large, and quality running poor. Considerable trouble is reported from mixtures of incubator eggs with fresh stock. In one instance 18 dozen out of a 30-dozen case were incubators, with a large proportion of rots and spots. Of course such things are contrary to law, but who is going to enforce the law against the man who sends such stuff to market? Certainly, not the dealers in the city. They have all they can attend to without looking for further trouble. But the law of common sense ought to prevent this sort of abuse of the egg business. Anyone who thinks he is getting fresh-egg prices for these tested-out eggs is mistaken. If they are not rotten the receiver may make returns at what they are worth and not say anything, handling the deal the easiest way.

White, choice to fancy, large	22 @	23
Common to good	18 @	21
Mixed colors, best.	21 @	22
Common to good.	17 @	20
Western fresh, white	21 @	22
Lower grades	15 @	18

FRESH FRUITS.

Apples in rather free supply and market dull except for fancy which are scarce. The writer has noticed more scald this year than for some time past. Strawberries are getting plentiful, and selling low, considering the good quality of a large proportion of the receipts.

Apples—Russet, bbl.	3 00 @	4 00
Spy	3 00 @	5 00
Ben Davis	3 00 @	4 00

Common to good.	35 @	37
Pacific Coast	18 @	20
Old stock	15 @	18
German crop	63 @	67

VEGETABLES.

Market on old potatoes very dull, and many sales 25 cents under last week's figures. Prices at some interior points are on a higher basis than New York, there being less competition with the European and new southern crop. Florida stock is selling well and running better in quality. Asparagus is in large supply from nearby and discounting the southern in quality. New cabbage in better condition, some having sold up to $2 per barrel crate.

RETAIL PRICES AT NEW YORK.

These are not the highest or lowest current prices, but are fairly representative of what the majority of New York consumers pay:

Eggs, fancy white, doz.	30 @	35
Mixed colors, new laid	24 @	25
Ordinary grades	20 @	22
Butter, fancy prints, lb.	32 @	34
Tub, choice	27 @	29
Chickens, roasting, lb.	30 @	32
Fowls	25 @	2 8

The making of moving picture films in this country has become a large industry. During the nine months ending March 31, we exported 146,000,000 linear feet of film. England takes nearly nine-tenths of our film exports.

*

Our imports of meats from Argentina since January 1 have been: 298,000 quarters of beef, 73,000 carcasses of mutton and 37,000 of lamb. Following are current retail prices of meats in New York. These are not the figures of "special sales," or the highest or lowest prices, but are fairly representative of business with many thousands of consumers: Roasting beef, 11 to 15 cents, according to cut; leg of mutton, 12½; leg of lamb, 15; leg of veal 16; pork chops, 18; stewing mutton, eight cents.

Wheat $1; potatoes $1 by the car, by the bushel $1.10 to $1.15; oats 46; corn 80; barley 75; rye 75; butter 28; eggs 18; milk 16 a gallon; lard 16; bacon 22; beef 14 to 20; veal 18 to 25; cows 50 to 95; calves, four weeks old, from $8 to $10 per 100; fat cattle $7.50 to $9; pigs, four weeks old, $6 to $8 per pair. P. W. L.

Balliettsville, Pa.

Cows, fresh, $80 to $120 as to quality; demand for dairy cattle is very brisk. Milk at local creamery or shipping station $1.20 for a 40-quart can. No local butter is offered on market. Eggs 20 to 21. Farmers in this locality have very little to offer outside of milk, eggs and poultry. P. M. D.

No. Branch, N. J.

Cows $50 and up; butter 28; milk six cents quart. A1 hay $14; apples 75 to $1; potatoes 65; onions $1.50; oats 45 to 50; corn 80. These prices are at private sale. H. E. L.

Rheims, N. Y.

May 10. Farm horses run from $100 to $250; mules about the same. At a public sale two days ago of unregistered Holsteins, prices for milch cows were as follows: 27 mature cows averaged $106 per head, 31 bred yearling heifers $70 per head. Milk delivered at creamery $1.60 per 100 pounds. J. W. C.

Lincoln, Neb.

This section produces corn, oats, hogs, cattle and horses. Farmers prepare and cultivate better than formerly; but more ground is plowed each year than should be. This is accounted for by the high rent paid by tenants, compelling them to get every dollar possible from the soil. Other farmers who own land, think they must do the same, and hence farms are getting poorer. But there are some, who grow Alfalfa and feed all their crops. Silos are getting plentiful; dairy cows are taking place of beef cattle. Much manure is wasted leaching and burning. Farmers are learning to control the San José scale in orchards. Corn 65; oats 32; hogs 7½ cents per pound; prime cattle 8; butcher stuff 7. Horses, chunks, $140 to $160; heavy horses $180 to $220; drivers $125 to $175. O. G. H.

Albany, Ind.

Cows $30 to $100; milk from 8 to 10 cents per quart; butter 30; eggs 15 cents per pound; chicken 14; lard 13; potatoes 75; corn 75; oats 40; rye 65; wheat 95;. Hay $15; hogs 10½; beef cattle, dressed, 12½ to 13; veal calves, live, 8½ to 9; sheep, live 4½; lambs 6.

Barree, Pa. J. S.

May 4. Prices of horses, say from $75 to $200; cows from $50 to $80. Hogs $8.50 per cwt.; steers six to seven cents; calves 10; lambs six to seven. Butterfat 22½; butter 25; eggs 17; corn 60 to 65 per 70 pounds; oats 40 to 50 as to quality, very poor light oats last year; wheat 92. Fowls 11; turkey 15; potatoes 50 to 65. Spring rather late, oats nearly sown and coming up, plowing for corn. Garden truck being planted; had light frosts last week. We have considerable rain past two weeks. Old peach trees mostly killed, the younger trees seem to be more alive; cherry and plum trees coming to bloom. This is one of the best farming counties in the State. Land price runs from $65 to $125 to the acre. It is a great onion raising county. Hundreds of acres raised each year, prices about 60 cents per bushel, last year. One firm is putting out nearly 100 acres of onions this year. Farm help $25 per month and board, day help rather scarce. Wagon from $1 to $1.50 per day. I think free trade is very wrong as it brings our high-priced land in competition with the cheap lands of other countries. With the present high wages people can well afford to pay the ruling prices of produce. W. D.

Albion, Ill.

We live too close to Washington, D. C., for much farming to be done. About half of the inhabitants of this county (Alexandria) find employment in the city. Quite a lot of milk sold at 16 to 17 cents per gallon to the middleman. Winter price 20 to 22. Some fruit growing and trucking; the people along the mountain country produce the staple crops, such as cattle, hogs, hay, corn and wheat. Horses and cows are scarce and high. Grain and stock bring as much here as in the city. H. C. S.

Barcroft, Va.

WANTED cheap Dutchess County farm, equipped. Write 41 MEADE AVE., Portchester, N. Y.

GOOD JERSEY FARM—Well located, to rent almost free to good farmer with good stock and tools. L. E., care R. N.-Y., 333 West 30th St., New York.

DAIRY FARM FOR SALE—240 acres; 40 acres timber; located in New York State, 50 miles west of Albany. Address C. L. C., care R. N.-Y., 333 West 30th St., New York.

WANTED—Productive general and fruit farm, about 60 acres, with buildings and water; state price, terms, full particulars; no agents. G. H. S., 405 Fourth St., Brooklyn, N. Y.

MAPLE SHADE FARM—115 acres; large house; barns and other buildings; gentleman's ideal home on Litchfield Turnpike. For particulars write EDWIN E. SMITH, Watertown, Conn.

FOR SALE—Fruit farm; 3,500 trees—apple, peach, pear, quince, cherry; 3 acres strawberries; all tillable; ten minutes' walk to railroad station. Price $7,500. E. D. HUFFMAN, Owner, Marshall's Creek, Monroe County, Pa.

SHENANDOAH VALLEY FRUIT AND TRUCK Farm, adjoining city, with churches, high school, military academy, female college, public library, opera houses, etc.; 3,000 fruit trees. Address PRIVATE BOX, N. Kent St., Winchester, Va.

COMPLETELY EQUIPPED commercial poultry farm, 35 acres; 3,000 capacity; thoroughbred stock; plenty fruit; large dwelling; mile from railroad. New York-Philadelphia. Successful business proposition, returning handsome profits; $15,000 part cash. BOX 256, Beverly, N. J.

COUPLE WOULD RENT VERY REASONABLE half of a large, modern farmhouse in Southern New England (Rhode Island); high ground; fine view of ocean and country; ideal for elderly couple or party seeking health. Address SUNNYSIDE, care R. N.-Y., 333 West 30th St., New York.

FARM FOR SALE—Farm of 160 acres, 2 miles from McDonough Village; an excellent dairy farm; good market for milk; land lays level and is easy to till, and under good cultivation; buildings and fences are first-class and in good repair; 150 thousand feet of sawing lumber on the place, mostly hemlock; owner wishes to sell on account of ill health. For price and terms call or address GEO. A. PURDY, Oxford, N. Y., or ALBERT BECKWITH, McDonough, N. Y.

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. **THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.**

FARMERS' SECURITY BUREAU, NEW YORK Agency Famous for Reliable Farm Help. No Branch. **SIDNEY SULLIVAN, Expert, 99 Nassau Street**

HUMOROUS

HE had just been rejected, and the shock had made a deep effect upon him. "I shall never marry now," he said dejectedly. "Don't be foolish! Why not?" she inquired. "Well," he said, "if you won't have me, who will?"—Credit Lost.

LADY, in boot shop: "These shoes pinch terribly. Haven't you anything larger?" Assistant: "You asked for number two's, ma'am. I can give you number three's or number four's or——" Lady: "The idea! I want something larger in number two's!"—Melbourne Australasian.

CRUSTY TRAVELLER, in railway carriage, caustically; "I am glad to see your baby has stopped crying, madam." Mother: "Yes sir. You are the only thing that's pleased him since he saw the animals at the Zoo!"—Melbourne Australasian.

"HAVE you anything to say before sentence is pronounced against you?" asked the judge. "The only thing I'm kickin' about," answered the convicted burglar, "is bein' identified by a man that kep' his head under the bed-clothes the whole time. That's wrong."—Chicago Record.

BEGGAR: "Mister, I ain't had nothing to eat for two days." Gentleman: "You told me that very same story a week ago." Beggar: "Oh! Then surely, boss, you'll help a poor man what ain't had nothin' to eat for nine days?"—Credit Lost.

"SOME adjectives," said a school teacher, "are made from nouns, such as 'dangerous,' meaning full of danger, and 'hazardous,' full of hazard. Can any body give me another example?" "Yes, sir," replied a fat boy. "Pious—full of pie!"—Melbourne Australasian.

"COLONEL," said the book agent to the Texas rancher, "those are mighty fine boys of yours." "The finest ever, stranger," acquiesced the colonel. "The finest in Texas." "I reckon you buy them anything they want?" "Why sure, stranger; I buy them anything they need, whether they want it or not." "Then, colonel, let me sell you a cyclopedia for them. There's nothing else that will benefit them so much." The colonel looked at the agent in astonishment. "Why, stranger," said he, "them boys of mine don't need no cyclopedias. They ride mules."—Lippincott's.

SAVE HALF Your Paint Bills

By using INGERSOLL PAINT—proved best by 66 years' use. It will please you.
Only paint endorsed by the "Grange."
Made in all colors—for all purposes.

DELIVERED FREE
From the Mill Direct to You at Factory Prices.
INGERSOLL PAINT BOOK—FREE
Tells all about Paint and Painting for Durability. How to avoid trouble and expense caused by paints fading, chalking and peeling. Valuable information free to you, with Sample Color Cards. Write me. DO IT NOW. I can save you money.

The General says:-

The dealer who offers you *Certain-teed* Roofing is the kind of dealer you can depend on for whatever you need in his line. He isn't fooled by plausible roofing "tests" any more than you are. This label on

Certain-teed

ROOFING

means 15 years guaranteed service—and the responsibility of the world's largest manufacturers is behind it—to protect *both* you and the dealer.

Your dealer can furnish *Certain-teed* Roofing in rolls and shingles—made by the General Roofing Mfg. Co., *world's largest roofing manufacturers*, East St. Louis, Ill., Marseilles, Ill., York, Pa.

Let Phelps Send His Big Book of Buggies to You—It's FREE

30 Days' Road Test
2 Years' Guarantee

I Can Save You $25.00 to $40.00

and make you a buggy that will wear like iron. Made of second growth Hickory—split, not sawed—that's one reason. Another reason is that Phelps watches every job through his big factory himself and knows it is of the quality to stand a hard road test. Nearly 200,000 persons are boosting for Phelps and his big saving direct-from-factory plan of doing business.

Phelps will make you glad you wrote, if you give him a chance. And if you want a special buggy of any kind, he will see it through the factory for you and save you money. Nearly

200,000 People Now Have Phelps Split Hickory Buggies

and have saved big money. They sent for the big book first, just as we want you to do. That's all we ask of you. We want to show you a splendid, big store put into a book and show you the secrets of fine buggy making and buggy price making. The book also shows bargains in *Fine Harness*.

Mail Your Name Today A postal card will do. No matter if you have already made up your mind to buy somewhere else, get the book. It will be an education in buggy making to you. Don't miss this. Write tonight. Address personally, H. C. Phelps, President.

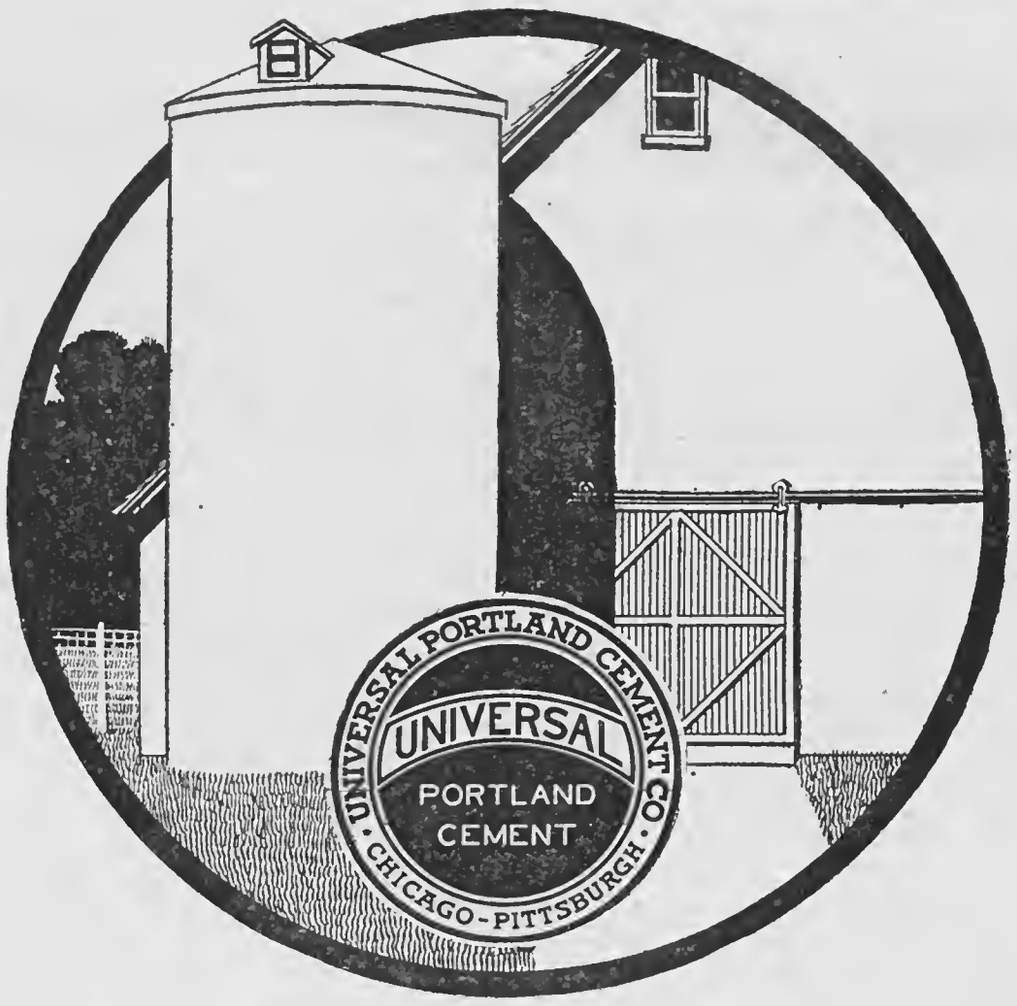
Harris STANCHIONS

stand for perfect cow comfort. Are full chain hanging, low down, with hinges on the side. Made of high grade steel, with perfectly smooth wood lining. Write for Free Descriptive Catalog showing complete line of Harris' Sanitary Barn Equipment. Prices moderate. Write to-day.
Harris Mfg. Co., Box 180 Salem, Ohio



The Economy of a Concrete Silo

The farmer who feeds his fodder green instead of dry gets the most out of his stock. The Silo being a permanent investment, should be built of the material which will give longest and most satisfactory service. Concrete is practically everlasting; it needs no repairs; is unaffected by time or weather; fireproof and ratproof; air-tight, water-tight. No other material has so many good qualities to recommend it to silo builders; nor is any other so enduring.

UNIVERSAL PORTLAND CEMENT

has been used in the construction of thousands of concrete silos. It has given such uniformly satisfactory results, that many farmers are using it for every kind of building on their farms. Our free booklets on "CONCRETE SILOS" will be mailed you for the asking.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII, No. 4257. NEW YORK, MAY 30, 1914. WEEKLY $1.00 PER YEAR.

THE ARGUMENT FOR ALFALFA AS A NEW YORK STATE CROP.

AN INCREASING CROP.—The first introduction of Alfalfa into the United States was in New York State about the year 1812, but for about ninety years it was little cultivated here. The seed brought from Chile to Southern California about 1854 is the source from which most of the Alfalfa grown in the State today has been derived. Some of the States in the West annually produce from one to over two million acres. In New York State in 1899, only 5,582 acres of Alfalfa were reported, averaging 2.33 tons per acre. In the next decade, the thirteenth census shows a marked increase, 35,353 acres, averaging 2.46 tons per acre. The growing interest in, and importance of the crop in the West, has undoubtedly affected the increased interest in the crop in New York, and with this increased interest has come a greater appreciation of its value, and a more general knowledge of the principles involved in growing it successfully. In spite of handicaps, Alfalfa culture is steadily gaining in the State. Unfavorable climatic conditions, especially the hard Winter, the high relative humidity, the low fertility of the soil, especially the low lime content, our lack of knowledge regarding inoculation and consequent failures have tended to retard its culture. Coupled with these factors, is the competition with Timothy and clover, so well suited to New York conditions, which it had to meet. Still another factor has been the conservatism of the Eastern farmers.

SOIL AND PREPARATION.—With the introduction and propagation of the hardier forms of Alfalfa, soil fertility is being considered more important than soil structure. With proper management a soil of good fertility and unfavorable soil structure, such as a very heavy clay subsoil, will give much better results than a soil of low fertility and good structure. In New York, the real reason for the failure of Alfalfa has more likely been poor fertility than unfavorable physical conditions of the soil. The needs for sufficient lime and inoculation, and a well-prepared seed bed are being recognized, and the Alfalfa failures are becoming less. In a series of coöperative experiments with about 200 farmers carried on by the Geneva Experiment Station a few years ago, the results showed that where the soil was untreated only 20 per cent. of the Alfalfa seedings were successful; where lime was applied to the soil, 40 per cent. were successful: where inoculation without lime was tried 60 per cent. of the experiments were successful, and where both lime and inoculation were used, 80 per cent. were successful. Only 20 per cent. were failures. This shows clearly the general need both for lime and inoculation throughout the State.

CROP VALUES.—Table 1 gives a comparison of the market values of Alfalfa, clover and Timothy, based on data secured from the last census report. It should be noted first that the yield per acre is more than twice that of Timothy and almost twice as great as the yield of clover. The price per ton was greater than for clover but less than for Timothy. With a wider recognition of the general superiority of Alfalfa hay, and a continued increase in demand, it may be expected that Alfalfa will soon rank first, and supersede Timothy. The surprising difference in value between the three crops is shown by the value per acre. The value of Alfalfa per acre is more than double the value of either clover or Timothy. With large yields, which may be expected, when more is known about the different factors affecting its successful culture, we should expect this value per acre to be higher than it is at present.

TABLE 1.

MARKET VALUES (13TH CENSUS REPORT, 1909.)

CROP	Yield per acre	Price per ton	Value per Acre
Alfalfa	2.46 tons	$13.58	$33.41
Clover	1.32 "	12.31	16.25
Timothy	1.07 "	14.62	15.64

Table 2 gives a comparison of the feeding values of these same hays. The feeding value per ton is taken from Farmers' Bulletin 339, U. S. Department of Agriculture, based on the value of the various digestible nutrients found in each. It will be seen that Alfalfa has a feeding value per acre almost five times as great as that of Timothy and over two and one half times as great as that of clover.

"DECORATION DAY." A MEETING OF THE BLUE AND THE GRAY AT HEADQUARTERS. FIG. 305.

TABLE 2.

FEEDING VALUES OF ALFALFA AND OTHER HAYS.

CROP	Value per ton	Yield per acre	Value per acre
Alfalfa	$20.16	2.46 tons	$49.57
Clover	14.12	1.32 "	18.64
Timothy	9.80	1.07 "	10.49

VALUE IN RATION.—In comparing the value of Alfalfa with bran and Timothy for feeding dairy cows, the Illinois Agricultural Experiment Station found (Bulletin 146) that a ration containing eight pounds of Alfalfa hay proves to be equal to the same ration when bran is substituted for the Alfalfa; also that a ration containing 10 pounds of Alfalfa hay produces 17 per cent. more milk than the same ration when Timothy is substituted for the Alfalfa.

ALFALFA AND SOIL FERTILITY.—Another important consideration is the effect of Alfalfa in

maintaining or increasing the fertility of the soil. As is well known, Alfalfa is a legume and can secure its nitrogen from the air. Table 3 has been compiled from the percentages of the three essential fertilizer ingredients, nitrogen, phosphoric acid and potash, found in Alfalfa and Timothy hay as given in Hunt's "Forage and Fiber Crops in America."

TABLE 3.

FERTILIZER INGREDIENTS IN 1 TON OF TIMOTHY AND ALFALFA HAY.

FERTILIZER ELEMENTS	TIMOTHY Pounds	TIMOTHY Value	ALFALFA Pounds	ALFALFA Value
Nitrogen	25.2	$5.04	43.8	$8.76
Phosphoric Acid....	10.6	.42	10.2	.41
Potash	18.0	.72	33.6	1.34
Total		$6.18		$10.51
Less N. secured from air.				8.76
		$6.18		$1.75

Of course all the ingredients found in the hay must have come from the soil in the case of the Timothy, and when the hay was removed from the land or marketed, these soil fertility ingredients were removed as well. In the case of the Alfalfa only the phosphoric acid and potash ingredients were removed from the soil, for the Alfalfa has furnished its own nitrogen from the air. In all probability, it has either left as much nitrogen in the soil as was found before the Alfalfa was grown, or it has actually increased the amount of nitrogen in the soil. The values of these ingredients were taken as 20 cents per pound for the nitrogen and four cents each for the phosphoric acid and potash found. It will be seen from the table that the value of the fertilizer ingredients on the above basis is $6.18 for each ton of Timothy hay, and $10.51 for each ton of Alfalfa hay. But inasmuch as the nitrogen content of the soil has not been reduced by the Alfalfa crop, the value of the nitrogen should be subtracted, which makes the total value of the ingredients removed and not returned $1.75 per ton. Figuring on the acre yield, the value of the ingredients removed by the Timothy is $6.61 and by the Alfalfa $4.31, or $2.30 more, in spite of the fact that the yield of Timothy is less than one-half that of Alfalfa. When a man sells a ton of Timothy he sells $6.18 worth of fertilizer constituents from his land; when he sells a ton of Alfalfa hay he sells but $1.75 worth of ingredients. From the standpoint of the maintenance of soil fertility, the culture of Alfalfa presents important considerations with which we must deal.

ACREAGE OF ALFALFA.—With a knowledge of the foregoing facts before us we still find the relative acreage devoted to Alfalfa ludicrously small. The thirteenth census reports in New York for 1909: 1,078,358 acres Timothy alone; 2,935,470 acres Timothy and clover mixed; 87,267 acres clover alone; 35,343 acres Alfalfa. Much must yet be done in the way of selection and development of Alfalfa varieties to meet varying climatic, fertility and soil conditions, and in the way of increased knowledge to understand various cultural methods that will insure the maximum yields and highest quality forages. J. H. REISNER.

R. N.-Y.—Has anyone definitely proved that Alfalfa takes all its nitrogen from the air and does not rob the soil of that element? We think this claim is to large. Again, we do not believe, from our own experience, that Alfalfa will prove profitable everywhere in the East. It is a wonderful crop and should be grown wherever a reasonable expense in labor and money will start it, but there are some soils where the crop is not naturally at home and where, we believe, other crops will give greater profit.

SEEDING GRASS IN THE CORN.

I wish to plow one acre of sandy loam soil as early as I can, and sow three bushels of oats on it and when about eight inches high or about the first of June, plow it under and plant to early sweet corn. At the last cultivation of the corn I would sow a mixture of Timothy, Mammoth clover and Orchard grass seed to make a meadow for the next year. When I plant the corn I would use about 400 pounds of a good corn fertilizer to the acre. Let us hear how you think it would work turning a corn field into a meadow the next year.
Denmark, N. Y. G. H. V. D.

Why do you sow the oats alone? The object is to obtain as much organic matter as possible to plow into the ground. We should sow Canada peas with the oats and also add one pound to the acre of white turnip seed. This will give you double the amount of organic matter that the oats alone would furnish. As you are seeding down the grass, we think that after this crop is plowed in, a ton at least of ground limestone should be harrowed into the soil before corn planting, unless you know that the soil itself is alkaline now. The plan of seeding the grass in the corn is followed by a good many farmers in New England and New York State. Some of them report success with this method, but not all. The soil must be in first-class condition to begin with, and unless there is a fair rainfall during the late Summer and Fall, the grass seed will not do well. In time of drought such a plan of seeding would not be likely to go through. The culture of the corn must, of course, be entirely level. The hills should be hoed down, and the whole surface left as smooth as possible, as otherwise there will be great trouble in cutting the hay. Many of the failures with this system have come where the corn was held up and the surface left rough and uneven, so that the mower could not do a good job in cutting the grass. You should use more seed than is commonly required in seeding the grass alone, and the seed ought to be spread both ways to obtain an even distribution. A very light cultivator or narrow harrow should be used to cover the seed and it will be necessary to use a rake around and between the hills to cover all the seed. Under right conditions of soil and climate and seeding this plan would give fair results, but with careless preparation of the soil, the stand of grass will not be satisfactory.

LAND BANK OF THE STATE OF NEW YORK

System of Mortgage Credits Explained.

PART V.

AN APPEAL TO LOCAL PRIDE.—No local banker or business man should hesitate to assist in the organization of a savings and loan association in his town. Anything that tends to improve the conditions of the neighborhood will benefit the local banker and tradesmen. These institutions manage saving and thrift. They accumulate savings and convert them through the local bank into productive enterprises. They form habits of saving in the young. They encourage the home instinct in the laborer and clerk. They inspire the hired man to save up until he can make a first payment on a farm of his own. They will keep boys and girls on the farm who without this incentive would seek city employment. If a man or woman has a dollar saved, the savings and loan association will keep it safe and pay for the use of it. If a member is in temporary distress he can get his money back. If he has real property, or if he is about to acquire it, he can get a reasonable loan on terms that reduce the annual payments below the normal rate of interest alone under the mortgage system of the past. All citizens are proud of a neighborhood where conditions like these exist. All interests profit by it; and all men should be proud of an opportunity to contribute to the contentment and prosperity that such a state of affairs creates in a neighborhood.

NO LONGER A SUPPLICANT.—For the first time in the history of the United States the financing of the farm mortgage is, under this system, put on a level with large corporations, or a public utility. It puts the financing of the farm mortgage on an equal footing with the sale of bonds of a city or township, or of the State itself. The farmer need no longer be a supplicant at the door of the money-lender. No man can any longer claim a farmer's vote or otherwise control his actions on an intimation that the mortgage may otherwise be foreclosed. Just as a city may bind all its citizens to the payment of city bonds, and sell the combined credit of its citizens at a lower rate of interest than the individual bonds of the citizens would have to pay, so the Land Bank of the State of New York may sell its bonds based on the security of the accumulated mortgages at a lower rate than each farmer would be obliged to pay on his individual mortgage. The farmer gets the benefit of this rate without incurring any additional responsibility himself. Just as the municipality or public utility corporation issues its bonds, and goes into the market and sells them on their merits for what they demand in the money market, so the farmer or home owner through his Land Bank, will sell bonds based on the combined credit of the farm and home mortgages, on terms regulated by the supply of money at the time and the quality of security offered. Since there is no better security anywhere the rate should not exceed the interest rate on municipal or State bonds. In this process the farmer and home-owner for the first time liquefy and standardize their mortgage credits. By this we mean he has converted his mortgage into a negotiable bond and given that bond such a stable value that it will readily and conveniently pass from one person to another without fear of loss by anyone, and without hesitation as to its actual value. The consciousness on the part of the owner that he is financing his business on an equal footing with other business men, that he is the master of the situation and not a supplicant for favors, stimulates an independence of action and sense of freedom that results in greater business success, and in higher appreciation of citizenship.

THE TORRENS SYSTEM.—As we begin to develop this system of mortgage credits and register mortgages under it, we may as well begin right, and register both farm title and farm mortgage under the Torrens System of land and title registration. This system originated with Sir Robert Richard Torrens in Australia in 1858. It has been adopted in England, Canada, South America, and in some of our States, including Massachusetts, Illinois, Indiana, Wisconsin, Michigan, California, Colorado and possibly some other States. In New York we passed a title law in 1908. Under this law an official examiner makes one examination and report of the records of the property. The title is then approved and registered by the Supreme Court and afterward the title can never be questioned. After that transfer is made by simply surrendering the old certificate and filing a new one at the nominal cost of two dollars. No more lawyers are needed and no further search of title required. There is no guarantee of title required and no fear that the title will ever be questioned. The State guarantees the title by its own act. Lest, however, the official examiner should make an oversight in the first examination for the Torrens title, an "assurance fund" is provided to compensate any person who through no negligence of his own is deprived of his rightful interest in the property and this must be claimed within six months of the original registration. This is a simple and a safe and economic method of insuring title to real estate. It was opposed by title insurance companies, which make enormous profits from the insurance of titles, owners and mortgagors in large cities. There is no one to oppose it in country districts, and in the interests of economy, convenience and safety, every association should provide in its by-laws that titles in the future must be registered under Article 12 of the Real Property Law as amended by Chapter 627 of the Laws of 1910. This is the title of the law under which the Torrens system of land titles is authorized in the State of New York. J. J. D.

A FARM TRACTOR IN WESTERN N. Y.

The scarcity and inefficiency of hired help require the large farmer to seek the most economical way to raise and market his farm crops. We wanted something to take the place of four to eight horses and relieve us of two or three men. To cut out the expense of feeding and care of eight horses for four months in Winter is quite an item. Our land is not all in one body and there is much hauling to be done that is extremely hard for horses. We wanted something to do this work up and down hill with eight or 10 tons load, and not require to exceed two men. This led me to try a farm tractor.

After studying the subject for some time we decided we wanted a medium heft machine, not extremely light nor too heavy to move on ordinary soil; one that would develop its full rated power at the draw-bar with the least consumption of fuel. Almost any of the tractors can develop all belt power the average farmer needs, but when it comes to a stiff pull up a heavy grade it is not always satisfactory to the buyer. We wanted a machine that would burn either gasoline or kerosene; by this I mean one equipped with two tanks so that you have the choice of two fuels. We also wanted a machine that could make four miles per hour on the road when necessary.

Of course we wanted as few parts and as simple a machine as was consistent with durable construction. We also considered how much delay in getting repairs in case of the breakage of any of the parts. The above are a few of the many points considered that may seem foolish to many, but the first cost of a tractor is large, and one should try to get as near as possible to a machine that will answer his purpose.

I presume that many are anxious to know what a tractor will do on our farm here in Western New York, with fields running from two to 50 acres each, with hollows and knolls to contend with and short turns to make at times. We have for plowing a four-plow gang, each plow independent, and called 14-inch plows, turning about five feet in width. We plow from eight to nine inches deep. The points of plows cut a little deeper, but do not turn the dirt out of furrow. With everything working well and suitable soil we can plow one acre per hour, working in eight or 10-acre fields. We have plowed on steep grade, down the hill only and went back empty, seven acres in 10 hours. We cannot plow as level and smooth as by hand or sulky, but can plow much more and deeper, and so far as I can judge the grain crops are as good on engine-plowed ground as on that plowed by hand.

We use for harrowing spring-tooth harrows, smoothing harrows and 12-foot plank drag, such as the soil may require at the time. We fit from 10 to 20 acres per day for Spring or Summer grain. We like the tractor for heavy mowing, and for loading hay with loader it is a great success with us. In hauling baled hay to the car, a distance of five miles with heavy grade, we load one car on average per day. In hauling potatoes it does the work of four teams.

When thrashing time comes we have only to hitch on the thrasher machine, use just our own farm help and the engine runs itself until we want it to stop. A little over one year's experience is not entirely conclusive as to the durability and cost of upkeep of a tractor. So far we have had but little trouble from breakage and the cost of fuel has been much less than we expected. C. C.

GROUND LIMESTONE AND POTATO SEED.

I HAVE a quantity of ground limestone on hand. Would you advise me to use it for dusting over the seed pieces of potato as they are cut—the same as land plaster or sulphur is used? G. R.

Ground Limestone Not Desirable.

Personally I never had any good results in controlling potato scab by adding lime or any substance which would tend to make the ground alkaline. In this region flowers of sulphur is worthless, and I am inclined to think no good results can be made with it elsewhere, for the potato scab fungus really likes to grow in quite a high percentage of sulphur. As to the use of ground limestone on cut potatoes, I can see no object in it if he has in mind potato scab prevention or prevention of the ordinary potato diseases. If it is just a method of drying the cut pieces so they will be less liable to rot when placed in wet or poorly drained ground, it is possible there might be some advantage. Just at present, there is such a craze on for using ground limestone as a fertilizer that it is liable to be recommended for anything. Ground limestone used in large quantities on acid soils will undoubtedly be good for potato production. Potato scab fungus does not thrive well on acid soil. If one puts on enough ground lime or other alkaline fertilizer to cause acid soils to become sufficiently neutral or alkaline to raise good potatoes, there will be plenty of scab there if they do not treat the potatoes for the prevention of scab. There are only two treatments which have proved worth while; the first is liquid formaldehyde at the rate of one pound to 40 gallons of water, the tubers to be soaked in this solution one and one-half hour before being cut. In using corrosive sublimate, the tubers should be treated before being cut, for a period of one and one-half hour in a solution made up by dissolving powdered corrosive sublimate in water at the rate of one ounce to six gallons of water. This is not only a good disinfectant for the prevention of potato scab, but is the most efficient one for the prevention of Rhizoctonia and practically all of the potato rot-producing fungi, including the Fusarium rot. H. L. BOLLEY.

North Dakota Station.

Sulphur Is Better.

I would advise against the use of ground limestone for dusting seed potatoes after cutting. I would rather use nothing whatever than ground limestone. Land plaster has been very widely used, and seems to have given good results. Numerous experiments in Canada over a period of several years have shown that the yield from seed dusted with land plaster is greater than that from undusted seed. Flowers of sulphur also is good for dusting cut seed. It is believed that the sulphur has some influence in the prevention of scab, and perhaps also acts as a fungicide in the prevention of rotting of the seed, although that has not been demonstrated. One objection to sulphur is the fact that it gets into the eyes of the person cutting the seed and handling the potatoes in planting.

Geneva (N. Y.) Exp. Station. F. C. STEWART.

Soak the Seed Potatoes.

I should not recommend rolling the cut potato tubers in ground limestone before planting, unless I had positive evidence that there were no germs of potato scab disease on the potato tuber, or in the soil; and since it is practically impossible to have such assurance in advance, I think it would be very unwise to use the ground limestone, as proposed. The employment of land plaster instead of ground limestone would not be open to this objection, for whereas ground limestone will increase scab very materially, land plaster is practically neutral in this respect. If the seed tubers are treated properly with corrosive sublimate solution before planting, there will be little need of rolling them in sulphur before planting, although if the soil itself is already seriously contaminated, this treatment would have a slightly beneficial effect, since through the oxidation of the sulphur within the potato hill, sulphuric acid would be formed, which would lessen the tendency to the development of potato scab on the tubers in the hill. It must be borne in mind, however, that if sulphur is used on soils already excessively acid, it will have a positively poisonous effect, as I demonstrated several years ago, in connection with my experiments in Rhode Island. In fact, recent German investigators have found that the employment of sulphur in soils is likely to be advantageous only in case there is plenty of carbonate of lime in the soil. In some instances, benefit from its use has been noticed when such conditions existed. Where superphosphate is used, however, sulphur is being continually applied to the land in the shape of gypsum contained in the superphosphate. Hence, the possibility of the sulphur having any direct fertilizer value when used in conjunction with such a fertilizer would be exceedingly small. Wherever soils are only slightly acid, neutral, or alkaline, the seed tubers may be rolled in sulphur without the probability of poisonous results. H. J. WHEELER.

A ROCKY MOUNTAIN CANARY, BORN IN NEW JERSEY. FIG. 306.

BUILDING A RAILROAD.

THERE is a question of great interest not only to myself but to all the people in this section. How can we get a railroad through this part of the country? The length of the road would be about 30 miles, beginning at Wallace, N. Y., on the Erie and D. L. & W. railroads, and running to Stanley or Geneva, N. Y. This is a fine farming country, all the way. The principal crops are potatoes, hay, fruits and dairy products. At present we have to haul this produce from three to 10 miles to markets. We have a fine grade for a road, and the right of way would be free. Farmers through this section would give from $100 to $1,000 to have some kind of a railroad. The railroads now here surround a large section of farming country, and they also prevent any other company from building a road here. These roads are now getting all the freight from this country, but to a great disadvantage to all the people who live here. Could the Public Service Commission do anything to help us, or is there anything we can do to help ourselves? We cannot build the road, for we have not enough money. J. R. D.

We are not experienced in building railroads. Practical steps however to be taken would be about as follows:

First, you must provide the funds. Some one must get at work in earnest. He must either get the surrounding farmers to subscribe to enough of the stock and bonds to start such a road, or find some substantial banker who will underwrite the bonds and stocks needed, and also furnish the equipment. This money must be in sight somewhere before you can think of starting such a railroad.

In the next place, you must obtain the permission and approval of the Public Service Commission of your district. You could not build a railroad or street line at the present time without obtaining from this commission a certificate of public convenience or necessity. You must prove to them that the road is necessary for the convenience of the public. You will probably find that this is hard to obtain. Not long ago an effort was made to obtain a road running through New York. The present railroads fought it so hard before the Public Service Commission that this commission would not grant a certificate. This proposed company had ample financial backing, but the opposition was so fierce that the commission held that there was no necessity for a third road, and that there probably was not business enough to keep them all properly running.

In the next place; you will have to obtain a clear right of way through the territory, even if you obtain a certificate from the commission. Probably this would not be hard to obtain, as the proposed road runs through a farming section where the people need this new convenience. From the map it appears that this road would run through a country where there are no large towns. For the most part this road would be paralleled by two other roads within fair distance. The chances are that there would be some difficulty in getting a certificate from the commission, since there would be hard opposition from the roads already operating in this territory. There would probably be less trouble in obtaining a certificate for a trolley line instead of a railroad. This would be much cheaper to build and grade, and would probably prove a greater convenience for your farmers, since freight stations could be put at short intervals.

It is possible that water power for running the trolley through electricity might be developed at the rivers and creeks in this territory. There is another plan which might be developed. That is for the farmers to combine, and with the State put in a good macadam public road through this territory, and establish upon it an automobile trucking line. They could provide a suitable service with these trucks for carrying freight and passengers promptly and thus come close to serving the purpose of a railroad. This plan is being carried out in a number of places with fair success. In any event, the first thing to do is to make sure of the money. The cost for a railroad or trolley line will be heavy. It is doubtful if the farmers themselves can finance such a line, and it will be necessary to get some financial institution to handle it. They must then obtain the consent of the Public Service Commission before they can start seriously at such an enterprise. It is quite possible that the automobile truck service would be the most feasible plan for a community of this kind.

"ROCKY MOUNTAIN CANARY."

THE picture at Fig. 306 shows a little donkey colt, or a Rocky Mountain canary. This kind of canary is very rare in the East, and little Killarney, as this one is called, has attracted great attention. She is owned by Mrs. Frederick A. Wilson of Englishtown, N. J. The father of Killarney was known as Jack, and its mother as Jill. It is the only little donkey that has really shown robust health in the many attempts at breeding which have been made at Bellwood Farm. Therefore Killarney is something of a novelty, and we are glad to give her the picture in THE R. N.-Y. May she grow up to be a true representative of New Jersey, and it is also in order to remember John Burns, the special custodian, breeder, handler, and breaker of Miss Killarney.

"SWAT THE FLY."—Everyone seems to be waking up for the fly fight. The latest advice comes from James W. Helme, Dairy and Food Commissioner of Michigan:

"Consider the house-fly and his mate. They toil not, neither do they spin, but when it comes to bringing forth posterity, they have got Teddy Roosevelt's hobby beat a mile. About this time Mr. and Mrs. H. Fly leave their Winter quarters and hie themselves to the nearest manure pile, where Mrs. H. Fly makes her nest and lays 120 eggs at one sitting. As a layer Mrs. Fly has got the White Leghorn beat to a frazzle. In 12 hours these eggs hatch into maggots and unless picked up by the old hen and converted into eggs, they crawl down in the manure and eat for a week. Then after lying dormant for another week, they come out full-fledged flies dressed out in an Easter suit minus the hat and split skirt, and proceed to give the race suicide theory another blow in the solar plexus. Every fly killed in May means 1,000,000 less flies in September. Now is the time to swat the fly and swat him hard."

No question about the damage from this filthy insect, but do more than "swat." Go to the origin of things and either keep the horse manure under cover or well sprinkled with equal parts of acid phosphate and kainit. Five minutes at this work will accomplish more than five days work at "swatting."

THE CO-OPERATIVE CONFERENCE.

At the request of Commissioner Huson, a conference was held at the State Agricultural Department in Albany, on May 20th to discuss methods of organization of farm coöperative associations and companies. The men who attended were largely from the membership of the State Standing Committee on Coöperation and for the most part farmers from the fields and leaders in coöperative companies in their home towns. Their interest in the work is testified to in the fact that at this busy season, they leave their farm work, pay their own expense to Albany, and respond to the request of the commissioner to help the State in the development of coöperation work which it has undertaken.

The sense of the meeting as definitely and concisely expressed was that the Bureaus of Farm Institutes and County Agents where organized, should discuss and encourage coöperation as an educational function of their work. Directors Van Alstyne and Burritt both favored this policy, realizing that selling of his products is often a more important and more difficult problem to the farmer than the growing of them.

(2) That the special organizers that go out at the request of local communities to help organize coöperative companies be required to demonstrate their qualifications by passing an examination on cooperative organization and economics before being assigned to the work.

(3) That the representatives of the Department should continue to help build up and develop organizations once formed, where their services are further needed and required, as well as initiate new associations.

(4) That the Department should devise a simple and uniform system of bookkeeping and accounting and instruct local officers, where needed, in the opening of accounts.

At the request of Commissioner Huson a committee consisting of Prof. G. N. Lauman of Cornell University, C. R. White, Ionia, Seth Bush, Rochester and C. C. Mitchell, Millbrook, were appointed a committee to advise with the Commission and Director Cole, and to assist them in formulating rules to govern in carrying out the recommendations and the work as a whole.

Mr. Fred Sessions of Utica was selected as chairman of the conference; and it is only just to say that we have never attended a meeting of any class of business men where the speakers so closely confined themselves to the purpose to be accomplished. The discussions were directed to the question in hand and the problems were handled with uniform earnestness and intelligence. This work is not being inspired by a sudden burst of enthusiasm. These men expect difficulties and trials and troubles just as they always have in their homes and farms and families and business. They do not expect or promise miracles. They know to be permanent and beneficial the development must be slow and gradual. But they know they can accomplish things through coöperation that they cannot do individually, and as a matter of fact with less difficulty for the company than each separate farmer now encounters individually. Their minds are made up and their purpose is set; and the work is going forward. You will not see any miracles. No man will be able to sell poor goods for big prices; but five years from now when you look back to the records you are making today, you will see such a change in the marketing of farm products and in the purchase of farm supplies that you will wonder how we ever tolerated present methods.

Montgomery County Farm Bureau.

The Directors of the Montgomery County Farm Bureau engaged Mr. Allen S. Merchant as their county agent. Mr. Merchant was born and raised on a farm in Western New York, where he performed all kinds of manual farm labor. He took the four years' course in agriculture at the New Jersey State College. Mr. Merchant has addressed 18 Farm Bureau meetings on bureau work, has held two oat treatments for smut demonstrations, one orchard pruning demonstration, has helped to prune several orchards, showing the farmer how the work should be done; has made many personal visits to farms, giving information on many farm matters; he has secured for the county two Community Schools in Agriculture to be held next December; he has written a booklet on the Plans and Purposes of the Montgomery County Farm Bureau, which will be ready to go forward in the mail within a week. Every farmer in the county will be sent one of these booklets. The coöperation of more than 25 farmers has been secured in demonstrating the use of nitrate of soda on farm crops. One farmer is carrying out a demonstration in fertilizer chemicals on quite an extensive scale, to determine the elements of plant food the soil needs most, and just how profitable different fertilizer chemicals will be applied to different crops, compared with goods purchased ready mixed. Other farmers are coöperating in the growing of hay, Alfalfa, potato tuber unit selection and hill selection.

Canadian Fruit Outlook.

The Department of Agriculture at Ottawa states that in Nova Scotia fruit trees have come through the Winter in good condition, with prospect of a heavy set of bloom. British Columbia has had a very mild Winter, and all fruits promise favorably. In the peach sections of Ontario considerable damage has been done by the severe weather of January and February, following a mild early Winter. The outlook is that throughout the entire Niagara peninsula the peach crop will be the lightest in 25 years.

Monroe County, New York.

As everywhere else in the State, the season has been a backward one in Western New York. On May 15 many farmers had not yet sown oats. At Beechwood Farm we have given up this crop this season, experience having taught us that not one year in five is the crop a profitable one when sown after the first week in May. Grass and wheat never looked better at this time of year. April was almost an ideal month for both crops. The old meadows have a good start, too, and there will be a rank growth of grass to turn under before all are plowed for beans and corn. We have about 10 acres of our bean ground plowed at this writing (May 19). Early plowing and good tillage before planting is half the battle against weeds and drought. Peas for the canners are very late planted this year, and the chances of their proving a paying crop this season are small indeed. I would rather plant beans instead. Not in my memory has there been a more complete "clean up" of peaches; 90 per cent of the growers will not have enough of this fruit for table use. Only close along the lake shore and in especially favored locations is there promise of a crop. The total will not amount to more than 5 per cent to 10 per cent of last year's yield. Pears are blossoming fairly well, plums heavily, and apples, young and old of nearly all varieties, give promise of the heaviest crop in many years. M. C. B.

Agriculturally everything is opening up nicely in the West. Corn is going in this week with the soil in the very best condition; a little dry earlier, but two or three inches of rain Sunday night has relieved that situation. There will be a great crop of Winter wheat, and I think also of corn, in all sections that were drought-stricken last year. This is only history repeating itself. That drought in Kansas Nebraska, Oklahoma, Missouri and Southern Iowa pulverized the soil a couple of feet deep, so to speak, plowed it with the great drought-plow and compacted it at the same time, so that it takes up a great amount of moisture without swelling the streams. Under these conditions we should have a great crop. The fruit in that section, however, will likely be a partial failure, because of the effect of the drought of last year on the coming fruit buds. HENRY WALLACE.

Butter 18; eggs 17; potatoes 60; apples $1; wheat 90; corn 90 cents per hundred pounds. A. Y. S.
Bringhurst, Ind.

May 16.—We are having a very late season up here in the Worcester country hills. Doing our first plowing to-day. Plum and cherry trees in bloom; peach trees just coming in leaf; not a sign yet of apple or peach blossoms—in fact, according to my diary, just 20 days later than last year. Currant and berry bushes look well. Cattle have been out to pasture 10 days. It has been cold and wet, so the grass is in abundance, and looks like a big hay crop. We have spread a big lot of fertilizer and chemicals this year, and want to spray for Codling moths to-morrow if the wind will let us; have had terrible winds all Spring. Hay $20; cows $35 to $125; horses mostly automobiles. C. B. H.
Petersham, Mass.

May 16.—Good cows are selling from $60 to $80; fair to good $35 to $50. Milk at Whiting's $1.25 per 100 pounds for test 4 per cent. Potatoes $2.10 per 180 pounds. No apples last year in this section. Eggs 20, New York price, to-day for strictly fresh at this station. Good calves eight cents per pound. Hay $18 to $20 per ton. No garden crop; too far from market. F. M. B.
West Cambridge, N. Y.

The late Spring and much wet weather has been delaying the farm work here, but crops promise to be abundant. Wheat looks especially fine, and a good hay-crop is now assured. Early potatoes are well started, and the late varieties are nearly all planted. Tobacco plants are well started, and setting out will begin about May 20. The acreage will be less than last season. The peach buds did not suffer from frosts to the extent that earlier reports had it, and a fair crop is expected. Cherries will be abundant and the later fruits promise fair. Fat cattle are now moving to market at good prices for good quality. A lot of 15 steers was recently shipped from Quarryville for New York that averaged 1,561 pounds at nine cents on board cars, Quarryville. The average weight when stabled was 1,107 pounds.
Lancaster Co., Pa. B. A. R.

Fruit crop very promising, strawberries in full bloom, raspberries good but winter-killed badly. Fair crop of peaches; pears and apples are good, likewise plums. Grapes and dewberries in the Italian settlements south of us are fair.
Atco, N. J. N. E. V.

We have a truck farm with a vineyard and apple trees. Potatoes averaged through Winter 70; cabbage 82 to 85 per cwt.; squash 50 cents to $1 per cwt. Butter, country, 30; creamery, 40 to 45; eggs 20; hens 18; Spring chicken 38 and 46 cents, wholesale. Cows sell from $40 to $75; calves 10 to 11 per lb.; hogs, 10 to 11. Young pigs, $5 to $8 per pair. Wheat $1.10; corn 50. E. M.
Beltsville, Md.

May 13. Some oats are sown on dry spots; some have sown by hand who meant to drill them but many who got their ground plowed in the Fall to get their oats in early, have not been able to get on it yet. It is too wet to get manure on the planting ground, and is a bother when trying to make fence, as water fills the hole when digging for end posts, and dirt caves in. The parasite for San José scale does not seem to have reached us yet, I had a young plum orchard with some scale on it last Spring, and we started to spray it, but the wind drove us out, and we did not get at it again; the scale spread very fast, and has killed the trees wherever it is thick on them. Peach buds killed, plums and other fruits blooming and all right.
Waterford, N. Y. M. F.

I devote my time to raising fruit. This year it looks as if we will have a large crop of peaches. The fruit business has become an epidemic; it is being distributed by the Agricultural Department for the benefit of the consumer in in a year of plenty. The Department has caused many persons to plant trees on ground or locations not adapted to fruit culture. When everything is favorable those trees produce enough fruit to lower the price so there is a very small margin of profit. I cannot see where the Department is helping the farmer. It is making new offices with nice fat salaries attached for a lot of glib-tongued individuals who if put to work with their own brains and capital would make a failure. I bumped up against one of them who did not know me and was surprised, so was he when we parted. In my opinion we don't need them when we have practical men giving their experience in papers like THE R. N.-Y. Last year had things my own way, as I was the only grower who had any peaches to speak of, sold direct to consumer. Elberta a full crop and finest I ever saw; they averaged $1.75 per basket, sold some for $2.50 per basket. Looking fine this year; I consider them the finest peach for the bank account.
New Pen, Pa. G. W. W.

Catching Sparrows in the Night.

Having read your article on page 618 regarding the English sparrow, I would like to give you my experience in getting rid of these pests. I take an ordinary pocket electric flash light that costs about one dollar and hold it close to me. Another person beats around their roosting places with a fish pole, and when disturbed they fly straight for the tiny light. Those that you do not get in your hand drop to the floor and are easily picked up. An ordinary barn can be completely rid of them in about 15 minutes. Of course it must be done on a dark night.
Ontario, Canada. P. O. A.

QUICKLIME OR HYDRATED LIME.—We have often been asked if hydrated lime is just as good as burnt lime or quicklime for making the lime-sulphur mixture or Bordeaux. We have had experience with the two limes in making Bordeaux, and it seems to be evident that the quicklime is superior for this purpose. We think the same is true of the lime-sulhpur, although we have not had personal experience with the hydrated lime for this purpose. From choice we should take the quicklime.

Man-eating Sharks.

There seems to be some doubt whether sharks really attack humans. I have secured some information on the subject from a couple of Bahama Islanders which I send for the benefit of your fish department. You say a certain government official says they don't tackle humans. Government officials know a heap but they don't know it all. The Bahama Islanders say they do eat men, that is, the big ones do. If a person is in water where he can wade he can frighten the small ones away, but the big ones don't seare worth a cent, and then you would better look out. My informants said they knew of a big shark swallowing a man, but the man had a knife in his hand and promptly cut an exit from the shark, and as soon as he could conveniently excuse himself he went home. I don't think our old friend Jonah was onto his job—indeed he wasn't. F. H. C.

Boca Raton, Fla.

R. N.-Y.—But those Bahama Islanders were eertainly onto their job of "telling about it." We might suggest the following conclusive test for the government experts to prove their case. Let them jump off a wharf into water where sharks are known to be waiting. Of course it might be claimed that they carry so many figures that they would make dry eating, but the experiment would be a good one.

An Effective Fire Extinguisher.

I have been interested in a couple of artieles in your paper on the use of fire extinguishers and the employment of carbon tetrachloride for this purpose. In our laboratory we use an extinguisher made in New York City whieh employs carbon tetrachloride as the aetive agent. This extinguisher consists of a eylinder and a piston therein actuated by a handle. It is loaded with earbon tetraehloride, and kept in this condition for use. To operate, the handle is merely worked back and forth and the fluid forcibly thrown on the blaze. This chemical is very volatile, about as much so as chloroform, and extinguishes the fire by produeing a blanket of non-flammable vapor whieh takes the place of the air necessary to the maintenanee of the flame. We have found this extinguisher equally efficient with burning wood, gasoline, alcohol, ether and other highly inflammable materials. It can be used where water would have no effeet whatever, as, for instance, if a quantity of oil is on fire. No hand fire extinguisher is of much use after the fire attains eonsiderable size, but if employed while the flame is small the one under diseussion will do very efficient work. W. F. DUBOIS.

Chief, Buffalo Laboratory.
U. S. Dept. of Chemistry.

Aphides on Rudbeckia.

I have a clump of perennial plants known hereabouts as "Golden Glow." They are free bloomers, the flowers a bright yellow, and pretty, but have the drawbaek of becoming infested with insects clustering on the blooms just at flowering time. The inseets are reddish in color, and are not unlike "red spiders." This seems general, and several of my neighbors have disearded them on this account. What is the best means of prevention, or the best way to get rid of them? W. H. T.

Germantown, Pa.

There is a reddish plant louse or aphis, not red spider, that is very tronblesome on the Golden Glow Rudbeekia. It is not usually noticed until so plentiful as to disfigure the plant. It ean be dislodged by spraying with tobaeco extract, which may be procured, with directions, from any seedsman, or with seven per cent. kerosene emulsion. It is well to inspect the plants from time to time, before the flowering period, noticing any aphids present, and using preventive spraying before the trouble is serious. Red spider is also likely to appear on the under side of the leaves during very dry hot weather; the sprays referred to will be beneficial, but this enemy may also be routed by hard spraying with cold water.

Alfalfa Questions.

On page 446 an article on Alfalfa by Harry Chapin eauses me to proeeed more carefully, and seek advice. I have 18 aeres wheat seeded to Timothy last Fall, and to Red clover this Spring. Would it be wise to sow two quarts Alfalfa to acre for inoculation purposes? Would that amount be suffieient, and would it be benefieial? Soil is good rieh loam.

Bloomingdale, Mieh. V. V. R.

I should not advise the sowing of a small quantity of Alfalfa with other seeding, for the purpose of inoculating the soil, though it might survive, and inoculation take place in two or three years, if the field had a heavy applieation of manure before seeding, thus insuring a plentiful supply of nitrogen in the soil. At best it is a tedious and uncertain method. If the small quantity of Alfalfa would grow a full seeding would; if it would not grow no inoculation would result. Where Sweet elover grows wild by the roadside Alfalfa will grow in the adjaeent field without inoculation, where it does not grow the soil can be inoculated by a very simple and inexpensive process. Three hundred pounds per aere, of soil from an old Sweet elover or Alfalfa patch, sown broadeast and dragged in without exposure to a hot sun, will seeure inoculation. I would advise letting the Timothy and clover on wheat field take their natural course, and select some other field well drained and in good condition, on which a eultivated crop was grown last year. Fit the ground as indicated on page 446, inoculate with soil if neeessary. Sow 30 pounds per acre of pure northern grown Alfalfa seed and expect at once paying crops and Alfalfa.

H. C.

Sawdust as a Manure.

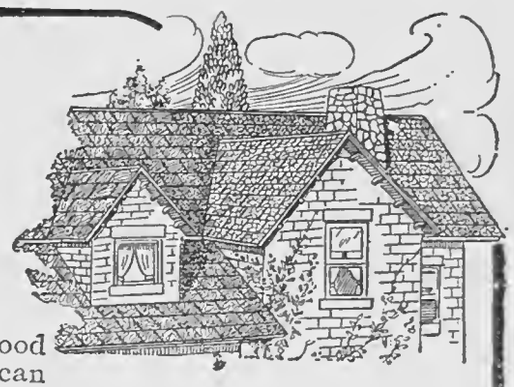
J. Q. B., on page 402, asks: "Would oak sawdust be of any value as a manure?" The proprietor of a sawmill in Wilkes-Barre told me he had a ready sale for all his sawdust at one dollar for a two-horse wagon-box full, and 50 cents for a one-horse wagon-box full; that it was bought by livery men, and horse keepers, for bedding their horses, and absorbing the liquid manure, and that farmers bought it readily, believing it was more valuable than when straw was used for bedding. He said sawdust was a deodorizer and disinfeetant in stables. I do not believe it is any better deodorizer than elean straw, and not nearly so good as dry earth, or land plaster. It is doubtful whether it is a deodorizer at all. It merely overpowers the foul odors of the stable, by the more pungent smell of the pine and hemlock tree. As an absorbent of liquid manure, it is no better than cut straw, or chaff, whieh will rot eompletely in a few months, while sawdust will remain sound in the soil for many years. Sawdust does not soon deeay. I have seen it in the soil after it had been plowed under three years, as sound as ever. Pine wood, when the pores are kept thoroughly saturated with water, is indestruetible. Some of the sawdust in our icehouse, whieh has been in use for 20 years, is not rotten. The large creek that runs through our farm in an overflow of its banks, left in some places considerable sawdust from the mills above. These plaees when the ground was plowed, produced nothing, because the sawdust made the ground so light and porous, it could not retain moisture, without which plants cannot grow.

When farmers in this region were clearing woodland, they were careful to put the old pine "sogs" on top of the log-heaps to be eonsumed, for well they know from experienee that rotten wood was an injury to the soil, and that no wheat would grow where the rotten wood was mixed with the soil. I once bought several loads of manure in which pine shavings and sawdust from a planing mill had been used for bedding and have always been sorry, for it was a long time in rotting, and the value of the manure seemed to be impaired by the shavings and sawdust. J. W. INGHAM.

Pine Shavings Hard to Rot.

Referring to composting pine shavings, page 668, will say white pine shavings make fine bedding for horses, cows or poultry, and I have used them for years, but have been unable to compost them as they seem to get tougher with age. We have plowed under manure, which we considered well composted and found on replowing the land three years thereafter, clean well-preserved shavings fit to be used for bedding again, if they could have been collected. We now spread the shavings manure with the spreader in the Fall on the corn stubble. This gives the rains a chance to leach the manurial value from the shavings and the wind will blow most of them away during the Winter. H. H. L.

Pay Less For Better Roofing



Why should you pay out your good money to the retailer when you can buy direct from us? Save that profit, get guaranteed roofing and with certainty of absolute satisfaction.

We choose our own raw materials and manufacture every roll of roofing. We know just what goes into our roofing and we stand back of it with an unqualified guarantee of satisfaction or money back.

We have 18 years' experience in the roofing business aud have over 30,000 customers. We are helping them to save money---just as we can help you.

Wears 10% Longer

Webco Weartex Roofing is made of the very best of long fibre, soft wool felt and a high-grade asphalt. Every fibre is thoroughly saturated with the asphalt---there's not an ounce of coal-tar, pitch or rosinous substance used. It is spark-proof, weather-proof and absolutely water-proof. It cannot dry out under the heat of the sun and crack, decay or rot.

Wind-driven rains, hail and snow have absolutely no effect upon it—it is proof against all atmospheric changes.

We are so sure of its wearability that we guarantee it to outlast any other roofing of a corresponding ply by at least 10%—and we back it up to the limit. That's the kind of roofing you should order now.

Save 30 to 50%

We have roofings at all prices, ranging from **95c** up to **$3.00** per Roll. They are all sold direct—there are no jobbers' and retailers' profits for you to pay. You save three profits. We employ no salesmen, therefore we are in a position to spend more money and give you better quality at a saving of 30 to 50%.

Absolutely No Risk

You are absolutely safe in buying direct from us—we guarantee our roofing to give you entire satisfaction or refund your money without question. We can refer you to three strong banks concerning our financial responsibility. You are protected in every way.

FREE—Send for this money-saving Catalog. Start now on the money-saving path—get this Catalog—it's sent to you postpaid. It tells all about our different roofings—how they're made and how they're applied. Page after page of useful information. Tear out the coupon and mail it now.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 626, April 25.*)

"I thought," Mr. James said, through chattering lips, "that the Indians were all on reservations, and safe in the custody of the government."

"They are," Jim replied laconically, "but if they take it into their heads to murder the government officials, and hike out on a massacre, what's going to prevent it?" Jim stared gloomily westward.

"Do you—do you—think it's—dangerous?" Mr. James could hardly articulate.

"Why, I don't know as 'tis," Jim replied reassuringly. "I've never been scalped, and it seems as though it would be a little inconvenient—if not exactly dangerous."

"Wh-what you going to do?" Mr. James inquired, wiping his face hurriedly, for the cold sweat was oozing from his forehead.

"I guess I'll eat my breakfast," Jim replied. "I may's well have one more meal. Come in and have a pot of coffee with me, and I'll open a can of something, might as well live high, if it's only for a brief span," dismally.

"Where are the fellers that stopped to my house last night?" Mr. James asked furtively.

"Someone stop there?" Jim inquired innocently.

"Just almost dark," Mr. James said, a little more quietly.

"Oh, yes, an ox team," Jime seemed to remember. "Why they turned around and went back didn't they?"

"They went down into my ravine."

"Do any damage? Wan't indians, was they?"

"I guess not—though both of 'em was brown enough to be 'most anything. I think they messed with my chickens, mebbe stole some eggs!"

"What'd they want?"

"Claimed the place, said 'twas theirn, 'nd they'd give me till to-day to get off. 'Spose they'l come back?"

"Oh, the fellows that own the place!" Jim said understandingly. "They aren't only kids, anyway."

"I come of fighting stock," Mr. James spread his short legs apart, and puffed out his chest, proudly. "Land hain't much good anyway, all shale mostly. Shale's no good," he added with a furtive look at Jim.

"I'm no fighter myself," Jim returned gloomily, "and I hope to glory I don't have to fight. I guess I'll clean my rifle, although I couldn't shoot a flock of haystacks. Indians most always go in clusters, don't they, like grapes, or buffaloes or things? Might be easy enough to plug one in a bunch, but then it might be like firing into a wasps' nest—you might get the rest stinging at you." Jim went dismally into his house, and ate a hearty breakfast.

Mr. James, with many furtive shoulder-back glances, stubbed across the line, and after waiting, fearful for something and finding nothing doing, he crept out, and went down into the ravine, to inspect his setting hens. He found them undisturbed.

"Harmless sort of fellers, them," he murmured. "I wonder if I couldn't take these settin' hens with me, if the Injuns should come."

"Halloo, halloo, halloo!" came a shrill call, and a horseman halted on the hill, waving wildly to the man in the ravine. With heavily beating heart Mr. James ran up to meet the rider as fast as his stubby legs could carry him.

"There are rumors—however vague I am not prepared to say—that there will be an Indian uprising; there have been ghost-dances, and some say the Indians are already this side of the river."

The rider spoke in well-modulated tones and with chosen words; evidently he wanted to keep wholly within the truth of his statements.

"Do—do you think there's any immediate danger?" Mr. James inquired feverishly.

"I don't say there is any danger at all. I merely say there are rumors. But I'm on to the city, and somewhat in a hurry," and with a polite lifting of his hat the man rode down the hill, leaving Mr. James staring blankly after him.

In the afternoon some wagons with women and children passed by. These were followed by a wagon with four horses hitched to it, and in the wagon was piled a heterogenous lot of stuff, and to the first wagon was hitched a second, bearing a cow and a crate of something that might have been pigs. All these things looked to Mr. James as though moving on might be the better thing to do; but he was stubborn, and hated to give up just then; so he went from shanty to shanty, from land-holder to land-holder. All seemed discussing the momentous question, and what would be best to do under the circumstances. Would it be best to face the enemy or to fly from them? Some seemed wild for adventure, and others seemed anxious to pull out while there might be a chance.

"Once get into the city," Hank Jones argued, "then we could put up a front; but here on the open plain we couldn't do anything—just tomahawked and scalped and thrown out to the coyotes—ugh!" and Hank shuddered, as though he could see the gory sight and hear the howling of the wolves.

At five o'clock three men rode up to Jim Maynard's shanty.

"I s'pose you've heard," began the spokesman.

"Yes," Jim agreed, "we've heard," and his words included the body of settlers then collected about him. "Mr. James, here, is of fighting stock, and he—"

"Oh, I dunno's I want to fight. I never fit Injuns." His ruddy face had lost much color and his voice much assurance and bravado.

"The question is, what are we to do? Shall we all collect here and defend our land and ourselves, or shall we pack up and drive our cattle before us and go to the city?"

"I'm for going to the—" began Jim.

"So'm I," Mr. James agreed hastily. "I don't want to be scalped by no redskins."

"No, no!" cried a dozen voices. "Where's your valor? Mr. James for leader. He's fighting stock. He's the oldest. Mr. James—Mr. James for leader!" and a wild babel ensued.

"You see," Jim said to Mr. James gloomily, "you've brought this on us. If you'd cleared out there wouldn't have been anything to keep me, and I might have got away, too; but now—"

"Mr. James to the front! Mr. James to the front! He'll lead and bear the brunt of the battle, and guide us to safety!" It was Hank Jones now, and the boys fell into order, pushing Mr. James to the front, and in this way they marched to the James shack, and filled it to overflowing and crowded around it on the outside. Once collected there, Hank Jones suggested a cheer for their leader. "Three cheers for Mr. James, and we'll fight like him!" cried Hank, and the cheer went up.

Mr. James had sulked into the shanty, but at this he stubbed to the door.

"Shut up, you young varmints! Do you want to let 'em know right where we be? Now, shut up, the hull bunch!"

At nine o'clock Nate and Norm arrived, and Mr. James shrunk smaller than he had before.

"I don't believe there's a word of truth in it," Norm said, after listening to the rumors.

"But we did hear some talking about ghost-dances," Nate put in, grimly.

"There's been men warning us all day," Jim Maynard contested.

"And women and children and wagons and live stock have been going past, as though—" put in Hank Jones.

"I believe I can smell paint now. The savages always paint up for a battle," Jim Maynard whispered alertly. "Mr. James is our leader. He is a fighter—"

"Let him go out and reconnoitre," suggested Hank Jones, and he thrust the unwilling Mr. James out into the night. His face was white and his lips were trembling, and as they pushed him towards the hill-crest a sinuous form glided out of the darkness, near Jim Maynard's shanty. Mr. James trembled as he stood, but he could not advance.

"They're here!" he muttered, and he lifted his half-palsied feet, but he could scarcely move. Jim Maynard, standing near, fired, and then a dozen torches flashed into light, and a band of painted braves, gay with color and feathers, galloped into sight not a quarter of a mile distant.

"It's all according to Hoyle," Nate's voice spoke close to Mr. James's ear. "Feathers, paint, and—" here a mighty war whoop rent the air. "If you've ever done anything you're sorry for, you had better say your prayers, captain," Nate's voice still pursued, and Nate's long legs kept easily beside the older man's short ones.

The marauding band moved forward with a rush, shrieking, whooping, brandishing their torches. The boys in the shanty kept up a volley of shots, and pandemonium went wild. Mr. James was making for the creek bed.

"What, aren't you going to fight—to lead us on to victory?" Nate's voice was still close to the fleeing man. Mr. James's legs went like windmill wings, and he cursed the rank-growing grass in the valley. He stumbled over the buffalo bones, and sank deep in the soft earth of the garden, but with every fall he rose up again, and with every curse he sped forward, leaping, running, bounding, like one gone mad in a frenzy of fear, and as he plunged he muttered: "I wisht that shale land was at the bottom of the brimstone pit! I wisht them savages was under it! I wish—" and here a sudden turning of the creek sent his plunging form into the waters below him.

CHAPTER VI.

THE VIRGIN SOIL AND THE VIRGIN CROP. THE HORN OF PLENTY.

"Where's James?" asked Norm eagerly. And the question, "Where's James?" went around the circle, but none could answer.

"He's probably taken the trail, and will never be heard of again," Jim said, gaily. "The thieving, ornery land-jumper!"

"And all this war-paint and feathers are wasted on the desert air," wailed one of the Indian (?) braves.

"I wanted to give him a smell of my torch," a second voice moaned.

"And I just thought I'd like to paint him a smile," and another waved wildly with a paint pail.

Nate came sprinting back to the dishevelled group by the shanty, singing, "'There's one more river—there's one more river to cross, and our friend, the enemy, is crossing it," he volunteered to the dozen or more questioning voices.

"You haven't killed him?" protested Norm horrified.

"Oh, no; nothing as good as that, but something pretty nearly, for he has had an impromptu bath in the creek—fell headlong; but his cursing was enough to make the water boil. Wash up, fellows, and I'll make some coffee," Nate urged. "You've done us a mighty white turn, and you scared even me nearly to death. You're sure you're harmless?" and Nate edged off fearfully.

"He couldn't have held the land, anyway," Hank Jones declared. "A man doesn't have to live on his land for the first six months unless he wants to. He has that much grace, and the Government lets a fellow off if he needs to go to earn his living."

"He was such a consummate nuisance!" put in Jim Maynard; "always nosing around, and he had a fair chance to go."

"I don't know," Norm put in for fairness. "He came here and saw this land deserted. Maybe he didn't mean to stay more than over night when he stopped, and then he stayed longer and found out no one came to claim it, and so he decided to stick to it himself."

"Oh, he meant to have it. We told him, singly and in pairs and collectively, that the land was filed on fair and square, and that you would be back sure. He knew, but he needed an earthquake to shove him off. We tore his shanty down three times, and that would have given most anyone a hint of their unwelcomeness, but he's nothing but a ornery old—"

"He won't bother any for awhile," Nate put in soothingly. "He'll probably spread this tale of the Indian uprising far and near, and that will discourage any other would-be claim jumpers."

Scattered feathers, half-burned torches and a pot of red paint decorated the landscape the next morning; but heavy clouds drove Nate and Norm to extra efforts to get their new lumber made up into something more habitable than the thin board shack. Mr. James had left the boys' shanty. He had used it as a barn for his cow and one horse.

"We must advertise this stuff he left," Nate said, taking an inventory of the same. And so a few days later on an advertisement appeared in the local city paper:

"Taken up on ¼ section 36.R.17, one 8x12 frame dwelling; also one red cow and one dapple grey horse. Owner prove property, pay costs and remove the same."

This was signed by both boys. The advertisement ran for six months, but the owner did not appear, nor prove property, nor remove it.

"Gee, but this feels like Fall," Nate said as he began picking up the scattered war trophies.

"We've got a lot to do before we can go into Winter quarters with any comfort," Norm added, flinging a torch into the heap of debris collected.

"I'm wondering," said Nate, "if James didn't have some shred of right on his side. I'm not sure we are holding this land according to the full letter of the law, and I'm bound to hold it square."

"If we'd filed tree claims instead of pre-emptions, I am sure we would be safe with our 320 acres each. I believe when we go into Wetasket we will see about it and have the filing changed."

"We'll hold it square, anyway. I wonder where our papers are? We left them when we went to thrash." Nate spoke coolly enough, but Norm gasped.

"Our papers! Could that tyke have taken them?"

"Even if he did they're put down at the Land Office. We may as well pound away at this building work till it rains so we can't. We'll have time enough to hunt for the papers."

But Norm would not delay, rushed into the shanty and began to look.

"I wonder if they are in that fellow's trunk," Norm stormed. "I hate to open it, but I'll have to. He showed little enough consideration when he chucked our things out."

The trunk was locked, but Nate managed to open it with a nail, and the missing papers were found safe, much to the satisfaction of both boys. As they stood reading a little stream of water trickled down and struck Norm in the back of the neck.

Richer Soil at Less Expense

It is NITROGEN—the most necessary plant food—that most soils lack. Nitrogen *must* be introduced into the soil. The question is, how?

Ferguson's NITROGEN BACTERIA

used to inoculate the seeds of legumes—peas, beans, alfalfa, clover, vetch—gather Nitrogen from the air itself and store it upon the roots of the plants. They store up so much that the plants cannot use it all, and a large part is left to enrich the soil for future crops.

The same bottle contains all the varieties of Bacteria necessary for the inoculation of any legume.

Costs only a fraction as much as the best commercial fertilizer

Quarter-acre quantity, 50c.; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.

The Rural New Yorker, 333 West 30th St., N. Y.

"Why, it's leaking!" exclaimed Norm, looking up and receiving the washout in one eye.

"What doing, fellows?" inquired Jim's voice at the open door.

"We're getting leaked on," Nate replied cheerfully.

"And you'll get leaked on a lot more. We're in for a three days' rain. Where's your tar paper and an extra hammer? We could cover and batten one shanty in a little while if we all took hold; but you'll be about drowned out unless you do something to stop the cracks. It's been dry for a month now, and everything split open as far as it can be.

"Tar paper!" spurted Nate.

"And tar paper!" chortled Norm.

"Why, you're out of the fashion if you don't tar-paper your house out here. It makes it warm, and it keeps out wind and rain better than lumber or plaster."

"I thought homesteading and farming the simplest, easiest things in the world, and inexpensive; but I'm blamed if both don't eat up money like a gourmand," Nate said, whimsically.

"If it's got to be tar paper, it has to be; and if it's going to rain so we can't work, I'm going to Wetasket and lay in our Fall supplies. The rain won't hurt me, and the oxen will be out in it, anyway. I must begin to plow the minute the rain stops. I must get some land broken ready for Spring. We must make out a complete list now, so we will not have to go again till it freezes. We've simply got to have a breaking plow."

With Jim's practical help the boys made out a list that seemed adequate. And beside the general list Nate added a few small items for his own use.

"Put down emery paper, rotten stone and oil for me," said Nate; "and call at the post office and at the freight office, too. I'm expecting a bone cutter. I ordered it C. O. D. I couldn't wait till I got my money."

"Practical things, absolute necessities," Norm said laconically; but he made the memorandum.

"I'll make 'em pay for themselves," Nate answered cheerfully, smiling at Norm.

"Well, as you've been pretty economical with your cough medicine, maybe we can afford a few cents for emery paper to amuse the kid—" Norm stopped, looked at Nate sharply. "Say, kid, I don't know when you've coughed."

"I'm pretty well quit of that bad habit," gloried Nate, throwing his shoulders back and trying to thrust out his still shrunken chest. "I haven't taken a drop of medicine since we came here!" with evident pride.

"But I've bought stuff every time I've been to town," Norm demurred.

"And I've lugged it back every time I've been. I fixed it up with the druggist. I just wanted to see how long it would be before you noticed." Nate looked radiant.

"Why, you little scamp, you!" Norm spoke as though to a little child, for the lifting of this fearful handicap from the one he loved best filled him with such joy it nearly overwhelmed him. "Shake, kid; shake," and the two boys' hands met in a strong clasp. "Come to look at you; you do look as gay as a boy with a brand-new spanking." Norm paused again to fill his eyes with the goodly sight. "You're filling out, too. Your skin must be as thick again as it was when I first found you, lopping in your own blood under the pine tree at home."

"He looks as though he had pin fever. His legs are swelled up as big as knitting needles," Jim said dryly; but he stood with his back to the boys, and he thrust a bronzed hand across his eyes before he turned around.

"And to think I'd never noticed," murmured Norm, slipping his arms into his oilskin coat. "I'll bring you a great big treat of oil and rotten stone." And Norm went lumbering away.

"What are you going to do now?" inquired Jim, after Norm had gone.

"I'm going to begin to dig a little cellar under the shanty. I can make an opening to throw the dirt out, and we'll need a place for our vegetables. I see there's quite a little bunch out in the garden."

"I'll help," Jim volunteered. "No floor in this shack. We can begin right here."

Nate found the pick-axe and spade, and Jim took hold with the pick, while Nate shoveled out the soil loosened up by him. They were in the midst of their work, with dirt flying in every direction, when Hank Jones appeared.

"We're digging a cellar for our Winter supplies," Nate informed.

"Go get your shovel, you gazaboo!" ordered Jim; and Hank, nothing loth, joined his great force to that of the other boys. They had a jolly dinner together, and the work went forward with great gusto until Nate had to attend to the evening work.

"There!" he cried exultantly. "We've got quite a hole in the ground." Nate wiped his forehead and gazed admiringly at the cellar. "I believe I know better how to dig than I do to milk; but we can't let that cow go unmilked."

"Let Jim milk. He grew up milking," Hank suggested. "You're better at grub slinging."

"I'll sling the grub, but I'd like to milk that cow!"

"I'll work a little longer here," Hank volunteered.

"Which side do you sit on to do the pumping?" Nate inquired earnestly as he stood beside the red cow.

"Most any side," Jim replied. "She might be a left-handed pumper, for all I know."

"Is there a difference?" Nate asked innocently.

"You might try it and see," Jim said maliciously.

Nate sat down carefully on the left side of the cow. She turned her head and looked at him askance, but she did not say anything else. Nate reached forth a slim hand and began the pumping process, but only for an instant. The red cow lifted one onyx hoof and set it down inside the milk pail. Nate escaped unhurt, looking daggers at Jim, who stood convulsed with laughter.

"Try the other side," Jim suggested mildly.

Again Nate essayed to make friends with the red cow, but he had only reached out a tentative hand, when again the red cow lifted her hoof and objected.

"My thirst for knowledge is assuaged, Jimmie, come now; show off, smarty!" Nate said good-naturedly. And Jim, laughing and gurgling, sat down and filled the pail with milk, while Nate stood in abject admiration nearby. "How do you do it?" Nate asked, in awe.

"It's easy. Your early education was neglected, that's all."

"When I was in the cook shanty I made pancakes," Nate mused dreamily, with one eye on the triumphant Jim. "And cornmeal mush and milk wasn't bad, and I learned to juggle with milk and eggs and sugar, and make—"

"Shut up!" Jim said promptly. "I've showed you what I can do; now you go ahead and show your accomplishments—sissy things, anyway."

"That reminds me," said Nate with a laugh; and the two boys went back to the shanty. Nate plunged in, forgetting for a moment the cellar digging, and just caught himself on the brink, tipping half the milk over on to Hank, who stood below.

"Milk baths for Cleopatra!" Hank cried, spluttering and wiping his eyes. "It's a waste of good material that. Say, there isn't any use trying to dig here any more. I've struck slate. I've dug a little square hole, just to see how it is, but it's slate clear through."

"Nate is going to juggle with eggs and cornmeal and all sorts of things," Jim informed cheerfully. "And you and I will lay a floor while he does his slight-of-hand."

"Huh!" said Nate. "Who said so?"

"You said you could; now prove it," and with a laugh all three boys set to work.

When Norm drove up to the shanty door there issued odors most delectable, and Nate, with a pan of hot biscuits in one hand and a fork in the other, greeted him gaily.

"Get in here," Jim said. "Hank and I'll take your team. You've been out in the wet all day, and it's Nate's treat tonight."

Norm, nothing loath, entered the warm little shack and beheld the goodly array of eatables.

"Glory! but it seems good to get back home; and you've got on one of your gingham aprons. Say, I've got more stuff for you—letters," and he drew from his inner pocket several. "And your bone-cutter."

"Glory! but this is a red-letter day at the sign of the gingham apron," Nate chanted, flourishing an open letter. "I can sell all the buffalo horns I can supply for from $2.50 up per pair. Look here!" and Nate held the letter before Norm's astonished eyes.

"How on earth did you think of it? This'll be the first harvest off the land. I never should have thought of trying to sell such stuff. What a head you've got, anyway!"

"I hope it rains three days more. We'll jam into the horn-polishing business, and maybe we can earn a team of horses before Spring, if we have good luck."

"I've never helped, but I'm going to now. Even your worst foolishness seems to turn out into money, someway," Norm said warmly.

It rained for two days steadily, and Nate and Norm worked at buffalo horns as though their lives depended on it, and owing to so much having been accomplished before by Nate and Jim, at the end of the second day 15 pairs of horns were ready for shipment to an Eastern curio firm. And it happened that that very day Nate had a chance to ship them, sending to Wetasket by some settler going that way.

The third morning dawned clear and bright; Norm was up early, and after breakfast he brought out the oxen and the shining new breaking plow. "Now we'll lay out a land and break the virgin soil!" Norm exulted, so with many fussings and measurings, Norm finally turned a long furrow north and south, directly across the line between Jim Maynard's place and his own. How those boys gloated over that first furrow, Nate walking beside Norm as he guided the oxen to their task. How the rich black soil seemed fraught with romance and fortune! That soil, never turned to the sun before; never perhaps even trodden by a white man's foot. Oh, there was a glory of gladness in the clear October air, and it was not until afternoon that Nate could tear himself away from the fascinating field work; and he had taken his first real lesson in farming. After dinner, however, he uncrated and set up the bone-cutter in the chicken house, and set to work to grind the buffalo bones into a meal, which he hoped also to make a commercial product. The machine was a heavy, ball-bearing one, and the grinding was not as hard as he had expected. Still he hoped to fix some way by which it could be turned by horse or ox power. The days flew by as days had never done before. What with the breaking, which both boys enjoyed and shared, and the horn-polishing and bone-cutting, the time was so fully occupied with real work, full of zest and enthusiasm, it seemed almost no time until the first check for the sale of the polished buffalo horns arrived. Nate tore the letter open and glanced at the check. "Seven-fifty," he said joyously; "seven-fifty for those old, worthless horns."

Norm took the check. "Seven-fifty," he scouted. "Can't you read. It's seventy-five dollars!" Norm himself stood fairly aghast at the enormity of the good luck.

Nate gasped, gurgled, grasped the check and looked again. "You're right," he said, almost choking, to think that perhaps he could do his share and help along the partnership, which had seemed so one-sided to him. And, moreover, there was a hurry order for more polished horns.

Highly elated and encouraged by this venture, both boys devoted every moment of their spare time to preparing the horns for market. It was an arduous task, long and difficult, and very particular, and not one pair was relinquished until they were as smooth as glass and as rich as ebony. Every morning before light the boys worked with the grindstone, and every night they scraped with glass, rubbed with emery paper, with rotten stone, and finally with oil for the final finish. The grindstone Nate fixed with a foot pedal, so that one could use it without help, and this facilitated the work very materially. After the first return from the sale of the buffalo horns Nate and Norm considered buying a team of horses with great seriousness.

"We could buy a team for three hundred dollars," Norm said thoughtfully; "young mares, too."

"With the buffalo money, and what there is left of our thrashing swag, we could pay for one horse now and give our note for the other. It seems as though we could polish horns enough to pay for the other long before Spring," Nate replied optimistically. But Norm had an inbred horror of debt, which, however, after much thought, was overruled. With the horses, then both boys could break all day, and so give them a greater acreage for cropping the following Spring. And so it chanced that Norm went questing for the team, and came back at night with a span of beautiful dapple-grey mares. But with the team came other expenses. They must have harnesses, and a second breaking plow; and then, too, they must have good barn shelter, with feed and plenty of hay.

(To be continued next month.)

A Notch in the Right Place

And what it means to the man who wears "5130"

THE comfortable fit of a Clothcraft No. 5130 Blue Serge Special is due to care in little things.

Little notches in the edges of patterns for instance. Those notches are not put in by guess-work. Their position is calculated to a fraction of an inch. And every piece of cloth cut from the pattern has a tiny notch in exactly the same place.

When the parts that form coat and lining are sewed together, the little notches must correspond—not more or less, but absolutely.

Clothcraft linings are designed in advance to fit the garments, instead of being put in afterwards by hit or miss methods.

It's just one of several hundred improvements in individual operations that come back to you in better workmanship and—because that saves money—in better materials and designing.

Drop in at the Clothcraft Store and try on one of the 5130 models. It's the best all round suit we can make for $15.00. You might also look at some of the many other fabrics and pleasing patterns in this one GUARANTEED ALL WOOL line at $10 to $20.

Write for the new Style Book and a personal note of introduction to the nearest Clothcraft dealer.

There is also a fall-weight Clothcraft Blue Serge Special at $18.50 known as No. 4130.

This label on every Clothcraft Suit. Our signed guaranty in the pocket of every coat.

Hope Farm Notes

AS nearly as I can make out, this Hope Farm man uses air-slaked lime and puts it on every year instead of every four or five years. Does he not know that this is right against the advice of most of the authorities and experts? S. B. J.

He does—he knows it well. I do not pretend to be an expert or an authority. If I had that pleasure it would be in line for me to tell people just what they ought to do, and scold them a little if they failed to do it. I just use lime because experience tells me that it pays, and figures show that right here we get more lime for a dollar in the slaked lime. When you count in freight and handling, and consider that you must use twice as much of the ground limestone the slaked lime is cheaper. It might not be so in your section, but I would not buy until I had figured out the cost of a pound of lime in both kinds.

Another reason why we use slaked lime is that we want a quick, sharp action upon the soil. We are raising fruit, and the soil is naturally hard and tough. It needs breaking up and crumbling. The slaked lime is b tter for this work. Again, we plow under catch crops of rye, vetch and clover *every year*—not every three or four years. This yearly plowing under of green crops is likely to keep the land sour. Rye in particular would be bad on the land if plowed in year after year without lime. It is the toughest of our cover crops, and with its big hollow stems admits the air so that it is very likely to ferment unless handled right. With this yearly use of cover crops I am not so anxious to store humus up in the soil as I am to break the organic matter up and feed it to the trees. Thus we use 500 pounds or more of slaked lime per acre after plowing under the cover crop. This helps keep the soil sweet and hastens the decay of the rye. Do not mix this plan up with that followed in Western grain or stock feeding. The soil in such sections is different from ours, and the rotation is such that yearly applications of lime cannot well be made. So they use two tons or more of ground limestone when seeding to grass, grain or clover, or when plowing a sod for corn. While they plow under a sod every four or five years, we plow in a heavy green crop each year. That is why annual applications of lime pay us, but the system is not for general application. You see a man must use brains with lime, and think out a plan to suit his needs. Some of those experts talk as if it should be considered a crime to use slaked lime. I judge that some of them would like to have a law which would compel a man to use ground limestone. I would like to take a broader view of the matter, and tell a man to study and figure so that he may know when to use slaked lime or limestone, and how to buy a pound of *lime* for least money.

We use lime on everything except potatoes and strawberries. Field corn does not respond to it as some other crops do, though sweet corn is more likely to. We like to use a little lime whenever we plow green rye under. For example, we planted a field in sweet corn May 16. Rye was growing there—a little over two feet high. I would rather have it four feet, but this was an early planting. A heavy chain dragging in front of the plow put this rye under, and the plow was put down deep. Then we took the lime spreader and put about 600 pounds per acre right on the rough furrows. Then came the big Cutaway well weighted down. With this green young rye the weight of the Cutaway is enough to pack it solid. Had the rye been older we should have used the roller before the Cutaway. Then followed the Acme harrow, and the field was ready for planting. Fertilizer will be applied when the corn is four to five inches high. In a general way that is our plan for working cover crops. Under this system we have seen our soil grow more and more mellow and productive, while our trees have grown into fruiting at a very moderate expense.

"DECORATION DAY."—I think the picture on our first page this week is one of the most effective presentments of the subject that I have ever seen. This picture was taken in a border State, where war meant the separation of families and ruin. Here are two old soldiers—one who wore the blue and one who fought in gray, united beside the grave of some old comrade who died in the bloom of his youth. Beside them stands the little child—not able to realize what this ceremony means to the old men, and yet feeling something of the mingled sorrow and joy which fills their hearts. It seems to be impossible for an older generation to convey the full meaning of life's tragedy to those who follow. At a great army banquet once I asked a young man who sat next me if he could realize what the Civil War must have meant to the men of moderate means who left their families unprovided for and marched into actual battle. He looked at me in mild wonder at such a question, and said he had never really thought of it. The war was an acknowledged fact—tucked away for 50 years in history. He felt that the outcome of the war had been a good thing for him, but as for analyzing the sentiments of the people who actually took part in it, he was "not interested." When the company sang, or tried to sing, "America" this man helped out in a perfunctory way. When they sang one of these foolish songs about

"Father pays the bills;
He's all right!"

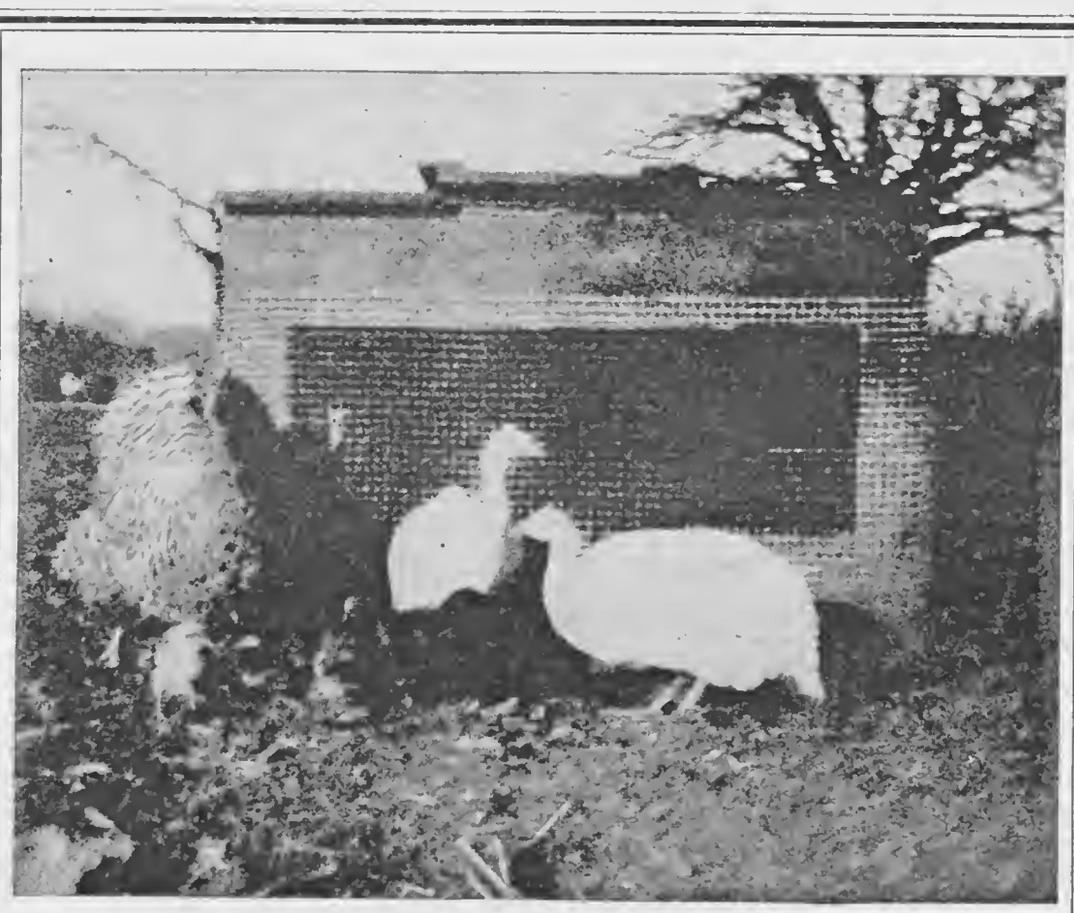
my friend tuned up in great voice. There was nothing mean or unpatriotic about him—a sound, clean young man; he simply failed to grasp the sentiment of it all. Show him these two old soldiers at the grave, and he could not realize how, as they watch those flowers, "the past rises before them like a dream." This young fellow cannot yet see that out of these dreams and visions must come the strength of the ages to give men that patriotism which can endure with patience and go down to the humblest things of life. "Decoration Day" will soon be a memory—vanishing into the great tumult of the busy years, yet there are many of us who can never forget what it means. It is harder for the women who endured the war privations to forget. Woman's world is at home, and oftentimes within its narrow walls there must dwell with her deep sorrows and painful memories. For to woman has always been given the hardest burden of the years and the poorest chance to throw off the yoke at home with outside pleasure or occupations. As Whittier wrote of the overworked farmer's wife:

"Sometimes her narrow kitchen walls
Stretched away into stately halls."

You see these old soldiers and their children have these dreams and memories of Decoration Day to break down their hard and narrow surroundings so that they may for the time being live in "stately halls" of imagination. Now the connection of what follows with Decoration Day is not entirely clear, but I say it now that we may think it over.

SENTIMENT THROUGH BUSINESS.—We are asked sometimes why in this Woman and Home Magazine we have so much to say about the business opportunities for farm women. It is because, with most women, their way to independent thought and feeling lies in the way of financial independence. When a woman can feel that she has developed some little source of financial income, and has proved herself, in some small degree, capable of doing business, she begins to take up that spirit and hope which go with independence. She is a better wife and mother and housekeeper from the fact that she has some little part in the world's business. It is easier for her to conjure up those "stately halls" while washing dishes or scrubbing, and we are all the better for visits to our more "stately halls." That is why this matter of developing little plans for selling homemade products will be the strongest feature of this magazine. We cannot have too many suggestions or true statements of what farm women have done in this line.

CHILD LABOR.—At this season the old idea of working children comes up. Shall we pay them for their labor or expect them to work for nothing? Here is a big question with many sides to it. Some people argue that the child should not be paid. "Make him realize that home is a coöperative enterprise where all must work and share." Thus these people talk, but many of them forget the last two words of their programme. The children work all right, but have no share or right to property. I think each child should have a regular job to perform with the understanding that this is his contribution to the home. After that is done I think it a wise plan to pay him for special labor. I follow that plan with our children and it has worked well thus far. We pay them in several ways. They make a bargain at so much for a job, they get a commission on sales, or they have the proceeds from a small piece of land. Not long ago the boys bargained to do a certain piece of work for 15 cents each. When we came to settle up little Redhead claimed that I had "a 50-cent job for 15 cents." When his attention was called to the men in the Scriptures who agreed to work all day for a penny while those who came at noon get the same because of a contract he agreed, but hereafter he will consider his labor bargains more carefully. Our boys have bank accounts for their savings. The three little boys have taken a rich piece of ground—perhaps one-eighth of an acre. They will set out Marshall strawberry plants three feet each way and plant Irish Cobbler potatoes 18 inches each way among the berries, with a few Telephone peas in each potato hill. This will mean hard culture. The potatoes will be dug early and then the boys will sell potted plants and lay down hills of strawberries for next year's crop. They will have the entire proceeds from the field. I shall try to get them to figure whether it will pay them to hire one of the Italians for a day's labor. A boy should be taught to *manage* as well as work. H. W. C.



CO-OPERATION IN THE HEN YARD.

The Plymouth Rock hen shown above is the mother of the two broods here represented. She hatched and brooded the White African Guineas during the middle of Summer. Then she stole her nest and hatched out a brood of her own about November 1. When the Guineas found that there were new babies in the family they followed the old hen about as if they were tiny chicks. Mrs. P. Rock cannot get rid of them and does not try to. Here is a co-operative society in feathers which might make many a human family take notice.

Penalizing the Saloonkeeper.

A NEBRASKA law giving the wife and children of men who become habitual drunkards an action against saloonkeepers who sell them liquor was sustained by the Supreme Court at Washington, on April 27th. Mrs. May Budger recovered heavy damages against Omaha saloonkeepers who had sold drinks to her husband, a paperhanger, and the court affirmed the judgment in an appeal taken by the saloonkeepers and their bondsmen.

This case is well settled. For many years temperance people have made a battle for this principle. If a man loses life or limb in a factory through an imperfect machine, or an accident which might have been prevented by the owner, his family would have a clear right to damages. They have the right to live, and husband and father's labor is essential. When a rum-seller makes a man an habitual drunkard he leaves the victim worse than if he had lost limb or life, and he should be made to pay for it. The strict enforcement of such a law will force many a rum-seller out of business—a splendid outcome!

A Little Discouraged at Parcel Post.

I HAVE been trying to study up whether or not it would pay to place an advertisement, taking advantage of your assisting offer in April 25th issue, page 636, encouraging parcel post business, and while it is proven a helpful thing, it strikes me that the mail authorities need "jacking up" before it proves fully successful. I have worried and fretted and wondered how I might assist in making ends meet, for I am trying to manage the poultry part of farm life, while my husband works out at carpenter trade, for it seems impossible to make a living off our farm without any capital, it being so dreadfully stony and hilly, too. We secured quite substantial egg carriers (having sent West for same), feeling that we might profit by sending eggs to New York privately, and our experience at that was discouraging through parcel post carelessness. About two dozen out of four were broken. One would think to see them packed that they could go anywhere in United States without breakage, so we had to cut that out. Then I managed to secure two customers for dressed chicken, and for all they are marked "Perishable" they are sometimes three days on the road. One sent last Friday, for instance, was collected here at 3 P. M. Friday, and never reached Park Place, Brooklyn, until Monday evening, and then had a great hole in end of package, where a mouse had had its feast off leg, and customer said it was unfit to eat. It has me rather discouraged, wondering how one can do business under such conditions. I might in time work up a little trade if Uncle Sam's men would only have more assisting power. Carefulness would aid a great many, and parcel post business, too. I like the country and like farming, but a woman cannot undertake anything but poultry out here. MRS. P. T. R.

New Jersey.

R. N.-Y.—We think the parcel post conditions will slowly improve as the service grows. We have had much worse complaint about express packages. A package collected late in the afternoon on a rural route in New Jersey could hardly be expected to leave the local post office that day, and it probably lay over Sunday in the New York office. We have never advised egg shipments, though some report fair success. We should stick to parcel post a while longer. You must remember that there is a certain proportion of loss in all business.

Ruralisms

New Blackberries.

If we estimate the progress of the blackberry by the number of new varieties that are being introduced we must admit that the prospects of its improvement are very bright. In this respect there is no comparison between it and the black raspberry although the ease with which the latter is raised from the seed should bring forward many new claimants. Among the new blackberries put out in quite recent times are the Himalaya, Robinson, Nanticoke, Watts, Joy, Star, Black Diamond a.d McDonald, while the Mersereau, Ward, Blowers and Eldorado are but little older than some of these. These make up an even dozen in number and the chances are certainly in favor of some of them possessing superior qualities.

Commenting on this list, I have already described the Himalaya. Since then I have received a letter from W. F. Bellairs, Missouri, in which he protests against my depreciation of that variety. He calls it the best berry ever grown and is planting several acres of it. Nevertheless a careful perusual of his letter fails to discover any definite statement of what the plant has really done for him that entitles it to recognition. I fear he is depending too much on printed statements by interested parties. The Robinson is a standard commercial sort in Texas, and will not stand a temperature much below zero. I had great hopes of it, for the berries are large aud fine and it is said to be very drought-resisting, but last year when my vines had everything in their favor, they failed to set a good half crop, and condemned themselves forever as shy bearers. A Texas friend writes that the Robinson is also shy with him, and that he finds it unprofitable. Therefore exit Robinson. Other Texas sorts, the Dallas and Sorsby, will prove themselves here this Summer. Of the McDonald I have already written. This season should be a conclusive test of it here, for I have it in quantity and adjoining varieties with which it succeeds in Texas.

The Nanticoke was introduced in 1912 as the latest of all varieties, and therefore a profitable market sort. It has never shown rust, is quite hardy (said to have come from Norway) is a fine table berry, but is too tender for a long distance shipper. The Nanticoke has not yet borne for me. The Watts, I have found to be a truly magnificent berry, possessing every desirable quality, great vigor, productiveness, luscious fruit of the largest size, but alas, the rust has doomed it for its victim and it seems little more resistant than the Kittatinny. My trial plants of Joy and Star (Ewing's Wonder) have just been set. The Star is planted six feet apart in row and tied up to eight foot stakes, which would lead one to think that it had a cross of strange blood in it, but we are told that it is quite distinct from the Himalaya which is a "light yielder of small berries." Then comes the Black Diamond with characteristics something like the Star. I have the benefit of the evidence of a fruit grower with no financial interest in this variety who writes me from New Jersey, where it also originated, that he finds it the most profitable sort in his community where berry growing is the chief industry. Its berry is large, glossy black and a good shipper and ripens after main season is over. He advises that plants be set six feet apart and rows eight feet. His soil is rather thin and sandy.

Of the older class of varieties Eldorado has an established reputation as a fine market berry. It is hardy even in the Northern States, and I have never had a cane to rust. Occasionally it has been charged with being shy in fruiting, but I do not find it so; on the contrary, it is one of the most productive. The Blowers does not seem to show qualities of any great value. It has not impressed me as a superior sort. The Mersereau fully sustained every claim made for it and might head the list were it not so subject to rust as greatly to impair its value. Every year I have to dig out a large proportion of its vines, and it acts as a propagator of the disease among more resistant kinds. I shall never plant more of it although it is a noble variety in all other respects. The last on the list is the Ward, and here we come to one of really sterling worth. It resembles the Mersereau in shape of berry but I do not find it quite so large and so sweet, neither is it quite so vigorous in growth so far as I have tested it but as regards the crucial test, resistance to rust, I find it one of the best. Ward, therefore, is one of the newer varieties that I should choose to set largely of if I were making a new planting. It is pictured herewith. L. R. JOHNSON.

Cape Girardeau Co., Mo.

THE WARD BLACKBERRY.

Snapdragons.

Do snapdragons come up second year from crowns where they were first set out, or do they start up any and everywhere seed has dropped? Will they thrive in sunny location? Do they need protection in Winter? M. M. A.

Closter, N. J.

The common garden snapdragon is a perennial, but is largely grown merely for the first crop of flowers. Most varieties are hardy here if covered with a mulch during Winter. Seeds are sown early in the Spring in frames or hotbeds, and transplanted later in the open ground. For early blooming they are sown in August or September, and carried over Winter in a cold frame or under a mulch. They like a sunny location, but will also thrive with partial shade, especially the dwarf sorts. Like most perennials, they will self-sow to some extent if allowed to ripen seed, though not as freely as some other plants do.

Planting Beans "Eye Down."

I read your article on "Writing for the Press," and here is my contribution. Anyone who will notice how a bean sprouts and grows will question the advantage to be gained by planting a Lima bean with the "eye" down. W. P.

Greenfield, Mich.

I cannot tell you as a botanist could just what changes take place when a bean begius to grow. But as I have observed it the bean first of all sends a sprout out from the "eye." This first sprout forms the root of the future plant. If the bean is planted "eye down" this sprout goes right straight down in a natural way, little rootlets come out from it and the bean is rooted. After this root gets a foothold the bean itself is lifted out of the ground; it splits in two halves and the true leaves come out from between these halves. Now suppose the bean is planted "eye up." What will happen? One of two things. If it has been planted shallow the little sprout which later becomes the root will come right up to the sun and perish and the bean die. If, on the other hand, there is a good covering of soil over it and the bean has plenty of vitality this sprout will start up and then bend over and go down. The top will appear four or five days or a week behind those planted "eye down." Through a misunderstanding we had, one time, about half an acre of Limas planted "eyes up." That experience was so very unsatisfactory that we cannot emphasize too strongly the importance of planting Lima beans "eye down." TRUCKER, JR.

Birds and Spray Poison.

The article on spraying and bird killing, page 697, is of interest to me because I have birds galore, but no cherries. There are several cherry orchards near here. My son and I spent several days trying to find out why they had bushels of cherries and we none at harvest. We spent two days during the cherry harvest in one orchard, and never saw a bird or heard one while there. We have done the same in other orchards near here and there were no birds there. They all sprayed their trees. I believe it is money in their pockets to spray their cherry trees with poisons, for if they do they will have cherries to eat and sell. With more than 20 large bearing cherry trees I have to buy or use them half grown. I am crank enough to believe what I see. I have never seen Alfalfa white with spray but I have seen cherry trees green with paris green. S. E. H.

Illinois.

"Then," said the man who was preparing the sketch, "I shall say that you first saw life in the little village of Backwoodsville——" "No," said Mr. Selfmade, "I was born there, but I didn't see any life till I came to town."—Chicago Tribune.

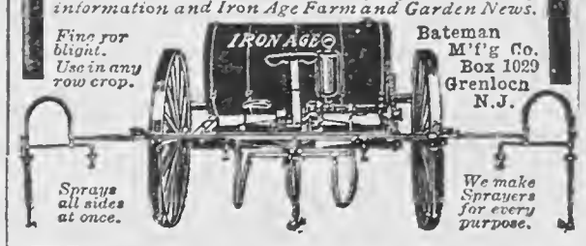
Something New In Traction Sprayers

Sprays 4 rows with 12 nozzles, 3 on each. 8 are low-down nozzles for still more thorough spraying of sides and underside of vines. Spraying saves your crop and *increases the yield.* One of a dozen

IRON AGE FOUR and SIX-ROW

Traction Sprayers, 55 or 100 gallon wood tanks, double or single acting pumps, wind shift, nozzles, strainers, thorough mixing, no corrosion. Ask your dealer about them and write us now for *new "Spray" book, spray information and Iron Age Farm and Garden News.*

Fine for blight. Use in any row crop.



Bateman M'f'g Co. Box 1029 Grenloch N.J.

Sprays all sides at once.

We make Sprayers for every purpose.

The Acre-an-Hour Sifter

beats every hand implement for killing Potato, Melon Bugs, Cabbage Worms, etc. Applies Plaster, Lime, etc., mixed with Paris Green or Arsenate of Lead. Regulates to cover big or little plants, also to apply any quantity of any kind of manufactured dry Insecticides. Will operate as fast as desired. Better, easier and faster than any $5, $10 or $15 spray pump. Insist on your dealer showing you this wonderful little implement. Prepaid, 75c. Agents wanted. Circulars.

MARTIN'S METAL STACK COVERS

Galvanized—Corrugated—Extra Quality Coating—

SAVE ALL THE HAY—PAY BIG PROFITS!

More economical than barns or permanent sheds. Easy to put on and take off. Made in sections, thus occupying little space when not in use. Made in all sizes.

Mr. Hammitt of Hardy, Neb., says: "Your cover preserved my hay fine. I got $1.00 per ton more for stack protected with your cover than for other stacks in same field."

The saving on the first stack of hay will more than pay for Martin's Metal Stack Cover. With ordinary care will last 15 to 20 years.

SPECIAL OFFER! Write today for free, illustrated literature and special introductory price to first purchaser in each locality. Write QUICK!

THE MARTIN METAL STACK COVER CO., Dept. 102

900-912 East Second St., Wichita, Kans. 25 S. Desplaines St., Chicago, Ill.

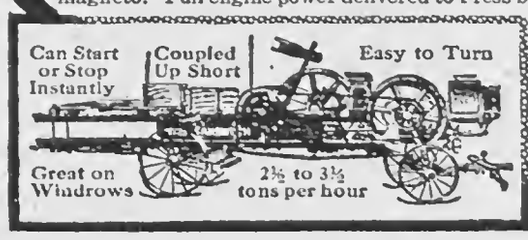
Stocks carried in Witchita, Kansas, Chicago, Illinois and Canton, Ohio. 10

Big Tonnage! Big Profits!

SANDWICH SOLID STEEL HAY PRESSES

No delays, sure, certain operation. These are yours with the fast working Sandwich Motor Press. Many owners make enough clear cash to pay for their outfits the first year—$200 to $300 clean profit each month. One Sandwich owner writes he baled "32 tons in 8 hours with a 3-man crew." Another now he averaged $18 to $22 per day after paying all expenses. These men can do this because they have the right press. 20 years experience built into it and special patented features found only on the Sandwich press—these are the reasons Sandwich owners make more money than others. The Sandwich way, the sure way.

SANDWICH Money Maker MOTOR PRESS has a hopper cooled gas engine mounted on same truck, 4, 6, 8 or 10 h. p., of more power than rated. Geared magneto. Full engine power delivered to Press by heavy steel roller chain. No power lost, no belts to slip or to delay. Simple self-feeder and the big feed opening just swallows the hay. Friction clutch right on press.



Free Book! The Way to Win

Send a postal today for our free catalogue *"Tons Tell."* It gives you reliable figures of the cost and profits of the hay baling; shows all the Sandwich Hay Presses, both motor, belt and horse power. Also ask for our special terms so you can buy your press from the profits made the first year. Write Quick. Address Sandwich Mfg. Co., 119 Oak Street, Sandwich, Ill.

Box 119 Council Bluffs, Ia. Box 119 Kansas City, Mo.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

IN order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

THOUSANDS of our readers will join with us in the deepest sympathy for our old friend, Prof. H. E. Van Deman, who has just been obliged to undergo a serious operation. Van Deman's friends are everywhere, and they are of the warm-hearted kind who remember. Let us all hope that our good friend may speedily recover.

*

IN the June number of the Woman and Home Department we shall begin a series of articles on

FARMING BY WOMEN.

The first one will tell how a woman who fell heir to a farm in Maine handled the hay crop. There are many women who have been left to take care of farms. Some are compelled to live alone—others farm by proxy. They grow everything from hay to honey, and we find that they keep books more accurately than the men. Their figures will make us all think.

*

A FEW years ago THE R. N.-Y. began to talk about using the moving picture show to help farmers' institute work. We were promptly given 50 reasons to prove that it could not be used. Yet it is being used right along. In Washington the State Good Roads Association sends about a motion picture showing how to use the split log drag on the road. Mr. D. Ward King, the inventor of this drag, is the hero of the motion picture. They tell us boys and girls leave the farm to chase the motion picture show. Can we not use it to help move them back?

*

THE public sentiment of this country will soon break out like a volcano on the subject of temperance. While Prohibition as a political issue has not made great progress, as a social and business issue it is rapidly becoming the largest thing in public life. It is confidently stated by those who know that Congress will, within a few months, take the first steps toward submitting a constitutional amendment prohibiting the manufacture and sale of distilled liquors. The House is ready to support partial prohibition—the Senate will probably delay. There is no particular division of parties over the question. There is a new division—saloon and anti-saloon. During the past five years the growth of temperance sentiment has been astonishing, and particularly in the country districts. The discussion of the 35-cent dollar has helped in this, because farmers see that the vast sums spent for liquor represent an economic waste. Absolutely no good can come out of the business of selling liquor, while it absorbs millions which ought to be spent for food and other necessities. The brewers, distillers and saloon keepers understand the mighty struggle that is coming and they are trying to prepare for it by various compromises. They will fail. Slowly but surely the liquor business will be driven into the large towns and cities, where it will become so evidently a menace and an economic disaster that public sentiment will wipe it out. If anyone doubt the truth of this prophecy let him consider how the temperance question has gained as a factor in public life during the past 10 years. We can remember what a fierce storm of hatred arose when President Hayes stopped serving wine at the White House. When Secretary Bryan served grape juice in place of liquor he had the outspoken endorsement of a great majority of American citizens. No class of people in this country are more interested in pushing this question of temperance than farmers. The money squandered for drink helps keep their dollar at 35 cents.

*

FOR a dozen years we have been coming at this season to give this advice—*Plant Corn!* Here we come again, more emphatic than ever before. Corn is the great American grain food—the most useful plant servant that grows on the farm. Put it into the silo and it gives the cattle barn pasture while snow and ice cover the fields. Dry and husk it and the grain feeds everything on the farm, from grandfather down to the smallest baby chick. Winter the horses on the dry stalks and turn the hay into cash. And where can the crop be found that can take care of an old sod or of a cover crop like corn? The tough, rank-growing corn will eat up the sod and leave it in far better shape for seeding to grass or grain, or for potatoes or any other farm crop. What can be better for a young orchard than a quick-growing flint variety? The crop will pay for all labor in the orchard and leave another cover crop to be plowed under. Feeder, farm scavenger and soil worker—that is corn. Work up that old eyesore of a pasture, or that old back field, fit it and fertilize it and *plant corn! Plant corn!*

*

IN this discussion of utility and standard poultry we want it clearly understood from the start that THE R. N.-Y. is not appearing as the champion of Tom Barron or anyone else. All there is about it is that these Barron birds, with their egg-laying performance, have brought to a blaze the conflict between utility and "standard," which has long been smouldering. The foundation fact is that these English birds, entered as "Wyandottes," are laying rings around the other birds at the egg contests. We shall not be surprised if the American Leghorns prove to be the "white hopes" to beat them out yet, but to-day these "Wyandotte" hens are champions. Now the point is this: Are these birds true "Wyandottes," or are they cross-bred birds with Leghorn or other blood mixed in? What difference does it make? Suppose a cow were to make the world's record at producing milk or butter. She is "boomed" as a Jersey cow, and her great record adds to the value of every other Jersey, and particularly to her own family lines. There is a great demand for her "blood" on the strength of her record. Now comes an authority claiming that this cow is a "grade" or a cross-bred cow, carrying both Jersey and Guernsey blood. Anyone can see that this would complicate matters at once, for if this cow had the blood of both breeds in her veins she would be a very useful dairy animal, but under breeding rules not eligible to registry, being neither a "Jersey" nor a "Guernsey," but a cross-bred cow. The case is not exactly the same with poultry, yet if a man is paying good money for Leghorns, Wyandottes or "Rocks," he has something definite in mind, and does not want a mixture of breeds unless he knows what he is buying. Now we open our columns to any evidence to show that these English Wyandottes are anything but what their name implies. Opinions and guesses are not evidence. It ought to be possible for the poultry experts to prove this point one way or the other. It seems to be up to the "standard" people to offer the proof first. Now, gentlemen, you have the floor!

*

WE are asked many times if there is on the market to-day a light gasoline or electric cultivator which will do the work of a single horse or a single team in a practical manner. We do not know of one which may be endorsed as fully practical. Such a tool is greatly needed, and many engineers and mechanics are trying to work out the plan. They seem to have worked on two quite different principles. One type presents a heavy machine with cultivator teeth dragging behind it like the plows on a tractor, tearing or digging up the soil like a horse cultivator. Such a tool must be quite heavy in order to grip the soil hard enough to drag itself along. The other type applies only enough motive power to the wheels to move the weight of the machine and a little more. The tearing or scratching effect upon the soil results from a power separate from that which moves the machine on. In one type digging is effected by a drum with teeth or spikes in its surface, which revolves or rolls over, tearing up the soil as it goes. In the other type sharp teeth are set in a ring, which revolves with a circular motion like the fingers of the hand whirled around in soft sand, or not unlike the claws of a hen digging and scratching in a garden. We think the type which separates the power of locomotion from that of work will most likely prove superior. At this time we do not know of one of these power cultivators which we can unqualifiedly recommend. We know a large gardener and nurseryman who says after a trial that he will promptly buy 20 of a certain machine when certain parts and adjustments are made stronger and mechanically correct. This man says that these machines, working properly, would enable him to dispense with at least 30 work-horses, just as the automobile has cut out four or five driving horses. We believe the gasolene cultivator is on the way and nearly in sight. At this time, however, the truth is that he who buys one must expect to pay for a share of the experimenting needed to perfect the machine. If any man is willing to do that it is his privilege to do so, and he helps other farmers by doing it, but he should know before he starts what he is doing.

*

I HAVE grown Alfalfa successfully on several farms in Maryland and also in New York, and have also had, in both States, a number of failures. I feel confident that failure in the last year or so has been largely caused by seed of improper adaptation to the locality. H. W. H.

We have had many statements like the above. We believe that much of the Alfalfa seed which has been used in the Eastern States is quite unsuited to the local conditions. Most likely we shall find that with Alfalfa, as with vetch and to some extent seed corn, the conditions of the section in which it is grown have much to do with its behavior when planted. In fact this question of seed adaptability and purity seems to be the coming great agricultural problem. We think it will be found greater than fertilizing or cultivation.

*

THERE are two things about this Mexican situation which we should all remember. The war now raging in Mexico is mainly a class struggle for the land rights of small freeholders. Mexico has been and is a country of large estates, with two principal classes—great land owners, and laborers, who have been in some ways little better than slaves. The great land owners have controlled the country in an arbitrary, despotic way. There is now appearing a third class—small freeholders, or the more intelligent laborers who desire to obtain land of their own. In one way not unlike the situation in France at the time of the Revolution, this new class of Mexicans are fighting to destroy land monopoly. When we come to understand this we may see how impossible it would be for this country to "pacify" Mexico. This land question is one which the Mexican people must settle for themselves. A strong class of small freeholders is always the surest guarantee of peace and order. The other thing to remember is that all this war talk is largely kept up by promoters or exploiters who have started rubber, fruit or oil propositions in Mexico. We have, in years past, exposed some of the companies which have sold stock in these Mexican enterprises. Some of them are fakes and nothing more; others are honest enterprises. All took their chances in a country which they knew was like a political volcano, and there is no reason why they should involve this nation in war.

BREVITIES.

REST and warmth is about all the little chick needs during the first 48 hours of its life.

"WHAT is meant by a food stuff?" asked the professor of domestic science. "My young brother," answered the young woman.

BEE-KEEPING in Porto Rico has grown in five years to a $100,000 business. The Porto Rican human may have his lazy days, but the bees are busy.

YOU will be interested in that story of the custom canning business, page 770. Here is a new scheme for carrying fresh meat through the warm weather.

WHAT do you say to agriculture in Greenland? It has been started in fox farming in four small islands in Good Hope Bay. We shall not emigrate.

MASSACHUSETTS undertook to bell the cat by passing a law to compel Tom and Tabby to stand for a license. The bill was defeated by a useful class of citizens, long known as friends of the cat.

WISCONSIN UNIVERSITY is planning a correspondence course in food study for prospective brides and young housekeepers. In the correspondence before marriage "angel food" is most discussed. Afterward the bride sadly finds that her husband is made by what he eats.

A NUMBER of delegations have been sent to Europe to "study farm conditions" at public expense. No doubt other gentlemen would be glad to go. Now comes the word that 50 South African *farmers* will go to England, Scotland, Canada and the United States to observe farm conditions. These men seem to be real farmers.

ON April 3, 200 cases of California asparagus arrived in Liverpool, England, in good condition. This asparagus brought good prices, and there will be a large demand for it in the future, during the season before local asparagus comes into market. There has always been a large demand for canned American "grass." This is the first time the fresh "grass" has been sent over.

WOMAN AND HOME

THE FOUR-LEGGED HERO

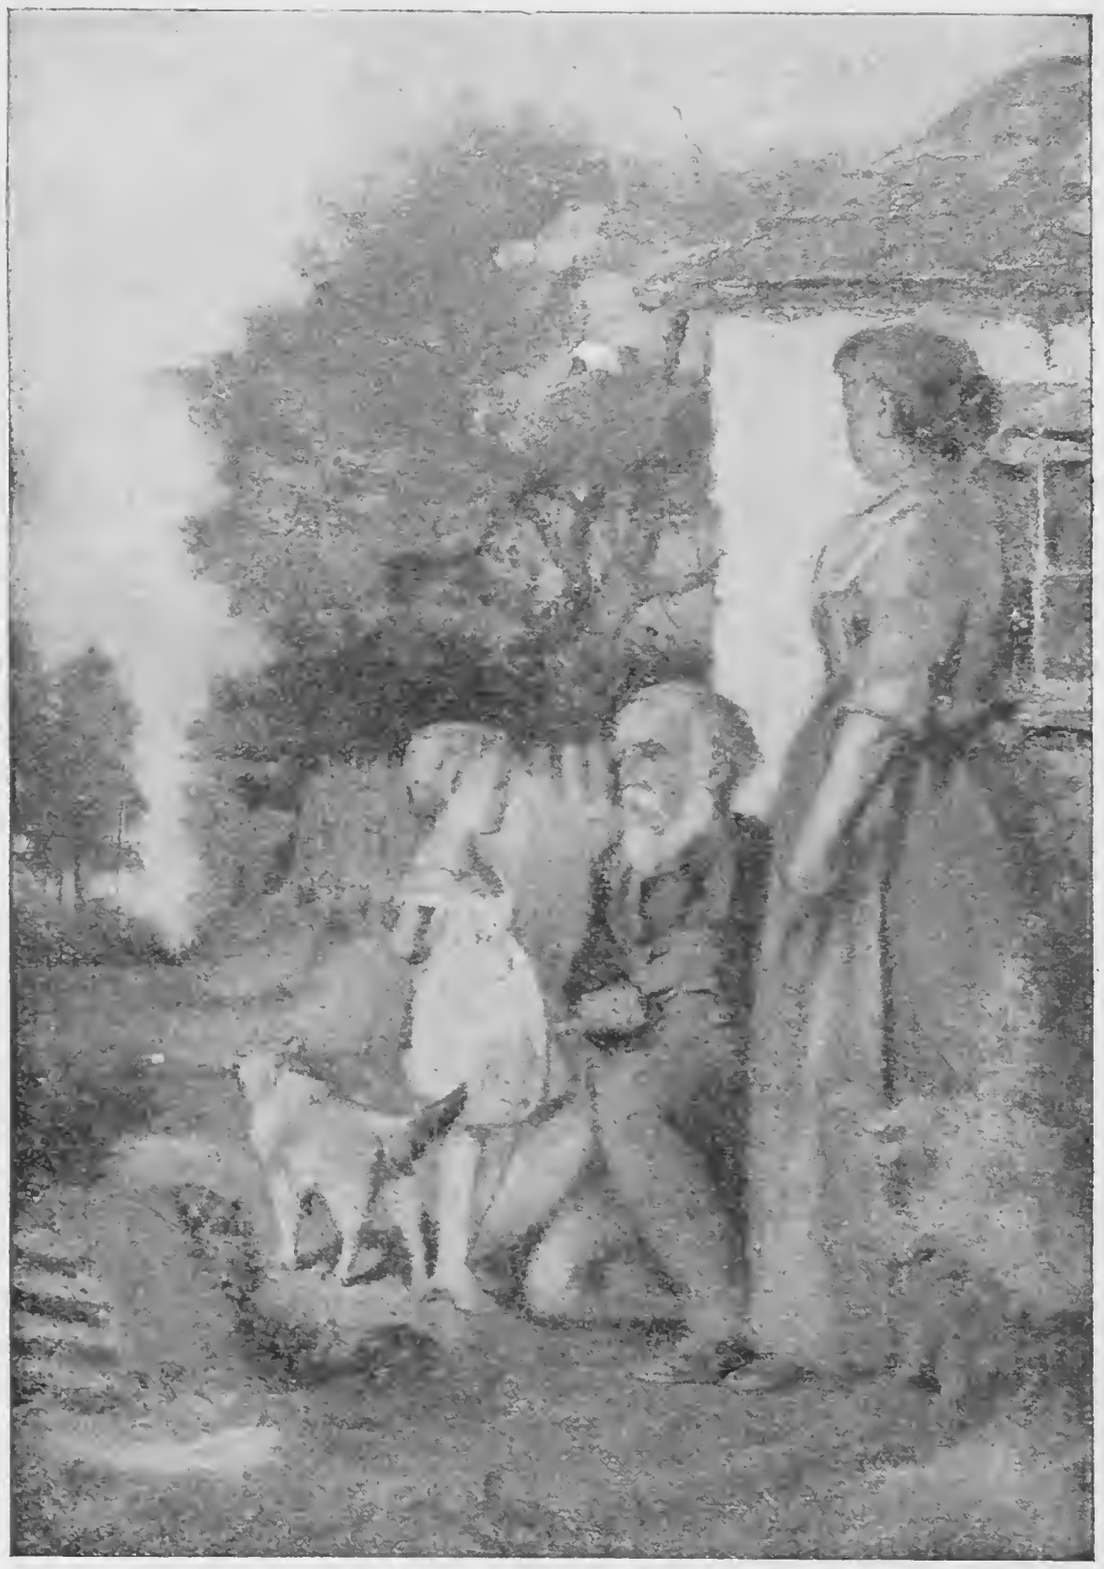
A STORY OF DECORATION DAY

By "THE HOPE FARM MAN"

Illustration By HAYNSWORTH BALDREY

You want another story—bringing Decoration Day
And flags and soldiers in it? Well, now, while your Pa's away
A-meeting with old comrades in the churchyard with the flowers,
Recalling back to memory ghosts of long-forgotten hours,
I'll just whirl in an' tell you while the thing is on my mind,
A story of old war-times that you'll never, never find
In printed books or papers, but for all that I tell you
We never should forget it or say it isn't true.
We came from West Virginia; just take out your little book
Wherein there's maps and pictures, and you hardly need to look
To see the way she hinges, right between the North and South;
Those mountains, as you may say, were the teeth in slavery's mouth.
And brother fought with brother—yes, and father fought with son.
All *my* boys loved the Union, and the whole of them but one
Marched off to serve McClellan. Billy's wife was Southern bred;
For her sake he turned southward, where old Stonewall Jackson led,
And me and mother waited through the war, with no one there
But Katie, Billy's daughter—little tot with eyes and hair
Just like yours to a shadow—for her mammy's heart grew still
When news come back that Billy was asleep at Malvern Hill.
I tell you it was lonesome waiting through those weary days.
The memory of that waiting can't be blotted out—it stays.
First one side and then t'other went a-riding back and forth.
As war went rolling southward or again rolled back up North.
One evening I sat nodding, with my bad leg on a chair;
A tap came at the window—I was mighty hard to scare
In those days—"Come!" I shouted. Strange enough it is to tell,
The door swung slowly open, and in walked, or rather fell,
A slender, light-haired fellow, pale, with ragged coat of blue,
A bandage on his forehead—didn't need to ask, we knew—
A wounded Union soldier—knew it all before he said,
"*A friend!*" We washed and fed him, and just tucked him into bed.
Don't know how far he'd wandered in his weakness and his pain.
Just raved about his mother, with the fever at his brain.
We hid him in the attic and we nursed him up with care,
Till tardy strength came to him and brought back his rightful share,
Until one pleasant morning—seems as though 'twas yesterday,
Around the rocks below us rode a squad of troops in gray.
"Run! Jump into that haystack!" I says. "Pull the hay down right!"
Was hardly under cover when the soldiers rode in sight.
Our Katie sat there playing with her dog out in the sun.
I called her up and whispered: "Don't betray him, little one!
Don't tell them where he's hiding; never mind what they may do.
Just do your duty, Katie. I know you'll be brave and true."
"Now, then! We want that soldier!" says the leader. "Well," says I,
"You better come and get him—I would say—you better *try*."
Then Katie's little doggie brussled up his hair and growled
As though he'd like to fight 'em; and the ugly captain scowled
And then grinned through his whiskers. "Here, jest catch that dog!" he said,
"And tie that rope around him—'round his neck, below his head,
And let the young one see him; you'll hear from her 'fore he yelps.
Now hang him up—be lively! Yes! Every little helps!"
They caught poor little Rover and then hung him to the tree
Down there beside the haystack—little Katie looked at me
With eyes just running over. Oh! If I had had my gun
I'd drilled through that big feller's heart a passage for the sun.
Poor little girl; she pleaded, "Please, sir, let my doggie go!
Please, please don't hang old Rover—you just *know* I love him so!"
"Well, will you tell?" "I can't sir, for I love that soldier, too,
An' grandpa told me always that I must be brave and true."
"Well, string him up!" Poor Rover! They just yanked him till his toes
Scarce scraped the ground—no whimper from the little dog arose.
The little four-legged hero—just chuck full of loyal grit.
There was tarrier blood into him, and them tarriers never quit.
"Now, will you tell?" Poor Rover! how he turned his patient eye
Up to his little mistress. "Don't you tell me any lie!"
The sneering captain added; but she raised her little head
And just fought back her sobbing. "*I will never tell!*" she said.
Then that hay stack rose up lively—much to every one's surprise;
Out jumped the Union soldier, fire just blazing from his eyes—
Just couldn't stand it longer. He stood up and faced 'em all.
"Don't dare to plague that baby! Fight with *men*, or not at all!"
They jumped on him and bound him, with his hands behind his back.
He stooped and kissed poor Katie as they led him down the track.
"Don't you cry, my little woman; you were true as steel," he said;
But the baby didn't hear him, for her little dog was dead!
They passed on down the mountain, leaving Katie lying there,
Her baby fingers clutching poor, dead Rover's curly hair.

At last the war was over and the wounds began to heal;
The rankling in your bosom sorter lost its savage feel.
We wondered if that soldier ever lived to get away;
Set talking it with Katie on the porch one Summer day.
A man rode up the mountain. My old eyes were getting dim;
I didn't need my glasses. "Katie, girl," says I, "that's *him!*"
Seems though I'd *always* known him—we sat there and talked away,
When he spoke up so solemn: "This is Decoration Day.
The graves of all the heroes will be covered thick with flowers,
The brave and silent soldiers sleeping through the Summer hours."
Then little Katie whispered, hardly knowing how 'twould sound,
"Old Rover loved the Union!" That big fellow gave a bound



I CALLED HER UP AND WHISPERED, "DON'T BETRAY HIM, LITTLE ONE."

Up straight as though you'd shot him. "Come," says he, now right away
Let's show our love for Rover this first Decoration Day."
Queer sight it was to see them hunting posies on the road;
Don't take such willing workers long to pick up quite a load.
I limped, and mother with me, just to see them decorate.
They wasn't any speaking— couldn't none of us orate.
The soldier only muttered—something glistening in his eye:
"*He who dies to serve his country has a holy death to die!*"
That's how this story *started*. I was sorter scared, I own,
When, 'most before I knew it, Kate bloomed out a woman grown.
The soldier says "I want her!" Nothing left for me to say.
I let them do the talking, and I reckon that the way.
Your eyes and hair and figure favor hers, my little dear,
And I, your double gran'pop, find myself a sitting here.
We don't forget old Rover when it's Decoration Day;
We give him fond remembrance, though his grave is far away.
Your mother says that never can we hope to pay the score;
